INTRODUCTION

THIS *sixth Britannica Book of the Year appears in the 175th anniversary year of the Encyclopædia Britannica. It is not a happy year. It is one in which the enemy is a force sufficiently powerful to threaten the privileges of democracy. From the beginning, the Encyclopædia Britannica has reflected the anxiety of peoples to have a reasonably happy time living. Encyclopædia Britannica has, since 1768, pointed the advantages of an enlightened public—a people aware of what is going on about them—a people privileged to know what is going on about them.*

In no dictator-controlled country could the Book of the Year be published. This obvious fact should have a significance for those who own or read this volume. Here is news of 1942—censored only where the fact might help the enemy, but recording without governmental restraint, the defeats and achievements of the year. It is a compilation which the Hitlers of the world could not permit. The fact that this volume can be published in a generation shocked by the harsh coercion of dictators is rich promise of final release from the madness that grips the world.

The year 1942 reveals death and destruction on a scale hitherto undreamed of. But since the essential facts of the year can be recorded without evasion, somewhere, anywhere in the world, there is guarantee that an enlightened public—which never tolerates dictatorships—means to survive this ordeal. Without such an enlightened public democracies must perish.

The Editor

EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPÆDIA BRITANNICA
AND OF THE BRITANNICA BOOK OF THE YEAR

JOHN V. DODGE, *Assistant Editor of the Book of the Year*

LIBRARIAN CONSULTANTS

ANNE FRASER LEIDENDEKER, *Department Librarian, Science and Industry Department, Public Library, Los Angeles, Calif.*

CHARLES F. MCCOMBS, *Superintendent, Main Reading Room, New York Public Library.*

WINIFRED VER NOOY, *Reference Librarian, University of Chicago.*

(Initials and names of contributors to the Britannica Book of the Year with the principal articles written by them. The arrangement is alphabetical by initials.)

A.B.Ho.	**A. B. HOLTON, B.S.** Superintendent, Technical Service Department, The Sherwin-Williams Co., Cleveland, Ohio.	**Paints and Varnishes**
A.Bm.	**ADELE BLOOM.** Acting Executive Secretary, American Association for Social Security, Inc., New York, N.Y.	**Social Security** *(in part)*
A.B.Mo.	**ALBERT BURTON MOORE, M.S., M.A., Ph.D.** Professor of History and Dean of the Graduate School, University of Alabama, University, Ala. Author of *History of Alabama;* etc.	**Alabama** *(in part)*
A.C.Ch.	**ARTHUR C. CHRISTIE, M.D., M.S.** Professor of Clinical Radiology, Georgetown University Medical School, Washington, D. C.	**X-Ray**
A.C.I.	**A. C. IVY, M.D.** Nathan Smith Davis Professor in Physiology and Professor of Pharmacology, Northwestern University Medical School, Chicago.	**Physiology**
A.Da.	**ALLISON DANZIG, A.B.** Member of Sports Staff, *New York Times.* Author of *The Racquet Game;* etc.	**Football** *(in part)*
A.D.An.	**ARTHUR D. ANDERSON, A.B.** Editor, *Boot and Shoe Recorder,* Boston. Author of *Shoe and Leather Lexicon.*	**Shoe Industry**
A.E.Gi.	**AUGUSTUS E. E. GIEGENGACK.** Public Printer of the United States.	**Printing Office, U. S. Government**
A.E.Sh.	**AUSTIN E. SMITH, M.D., C.M., M.Sc.** Secretary, Council on Pharmacy and Chemistry, American Medical Association.	**Chemotherapy**

OPA ordered civilian coffee rationing on basis of 1 pound every 5 weeks per individual, to start Nov. 29.

27 **Associated Press filed answer** to gov't's anti-trust action and charged federal suit constituted attack on freedom of press.

Stringent regulations to hold all salaries to $25,000 limit, excluding income taxes, charity donations, life insurance premiums and fixed obligations, were issued by James F. Byrnes, economic stabilization director.

28 **Germans launched flank drive** against Russians at Nalchik, in move against oil city of Ordzhonikidze in Caucasus foothills.

Gen. MacArthur lauded Australians for their "unanimous support" of his command and declared he had no political ambitions whatsoever.

30 **Japanese fleet withdrew from Solomons,** leaving Americans in full possession of their lines, Sec'y of Navy Knox revealed, but warned that only "first round" had been fought.

31 **American Flying Fortresses,** in third attack on Buin, Solomon island port, sank Japanese destroyer and damaged another, Allied headquarters in Australia announced.

50 planes bombed shopping centre of Canterbury in first big German daylight raid on England in 2 years.

NOVEMBER

1 **War was coming closer to Turkey's shores,** Pres. Ismet Inonu warned nation in address to national assembly.

2 **Allied ground forces** recaptured Kokoda and pursued retreating Japanese along New Guinea mountain trail leading to Buna; Japanese reinforcements were landed on east side of U.S. positions in Guadalcanal.

The pictures on this page are, left to right:

NOVEMBER—*Continued*

Russians admitted nazi forces had pushed beyond Caucasus town of Nalchik.

3 Republicans won decisive gains throughout nation in congressional, gubernatorial, state and municipal elections.

5 Lt. Gen. B. L. Montgomery announced that British had won complete and absolute victory in Egypt and that Rommel's armies were in full retreat; Gen. Ritter von Thoma, second in command to Rommel, was captured by British armies in Egypt.

Madagascar surrendered to British after 6 months of hostilities.

6 Joseph Stalin expressed confidence that Allies would open second front "sooner or later" and asserted that 8,000,000 nazi officers and men had been put out of action in Russian campaign.

Dispatches received in Madrid revealed that big Allied convoys, escorted by powerful naval force, were moving eastward from Gibraltar.

Treasury amended its $25,000 salary limit to exempt salaries payable under 1942 contracts.

7 British 8th army chased Rommel's troops 240 mi. westward to Libyan frontier, capturing 20,000 prisoners.

Joseph W. Martin, Jr. announced he would resign as chairman of Republican national committee to devote more time to congressional duties.

8 Large U.S. armies led by Lt. Gen. Dwight D. Eisenhower landed on Mediterranean and Atlantic coasts of French North Africa; Algiers surrendered with little resistance; Allied bombers scored hits on French battleship "Jean Bart" and four submarines in Casablanca harbour.

Pres. Roosevelt, who announced landings in North Africa as they were beginning (Dec. 7 in the U.S.A.) said they were made to forestall axis invasion of Africa; he assured French, Portuguese and Spanish that Allies had no desire for their territories.

Adolf Hitler, addressing nazis in Munich, said reich would strike counterblow against Americans in Africa in due time.

Marshal Pétain protested bitterly against U.S. landings in French North Africa and severed diplomatic relations with U.S.

R.A.F. planes rocked waterfront of Genoa with 2-ton bombs, inflicting severe damage on city's war plants and port.

9 U.S. forces surrounded Oran and captured 3 of 4 airfields in vicinity; France and U.S. formally severed diplomatic relations; Roosevelt asked Sidi Moncef Pasha, bey of Tunis, to permit passage of U.S. troops across Tunisia.

10 Allied headquarters in London revealed that Adm. Darlan was in U.S. custody in Algiers and was being "entertained" by an American general "with respect and dignity due an officer of his rank."

Oran fell to U.S. forces while other troops entered outskirts of Casablanca.

Churchill said African landings were prelude to new front against Hitler and said Roosevelt had devised this strategy.

11 Adolf Hitler declared the Franco-German armistice of June 1940 at an end as nazi troops marched into unoccupied zone while Italian forces advanced west of Nice and landed in Corsica; Marshal Pétain protested against German move as breach of armistice terms.

Casablanca surrendered to U.S. troops; Adm. Darlan ordered all French forces in north Africa to cease firing; Allied headquarters in Africa announced German air-borne troops were landing in Tunisia.

12 British 1st army headed by Lt. Gen. K. A. N. Anderson joined U.S. troops in eastern Algeria and started drive toward Tunisian border.

Maj. Gen. Mark W. Clark was revealed as head of secret U.S. mission to French Africa three weeks before U.S. invasion to sound out sympathies of French officers and lay groundwork for military operations.

U.S. senate approved bill for drafting 18- and 19-year-old youths in army and sent measure to White House for signature.

13 British 8th army occupied Tobruk and continued advance into Cyrenaica.

Adm. Darlan announced that he had assumed full responsibility for French interests in North Africa with approval of U.S. authorities.

Joseph Stalin, in letter to U.S. newsman, asserted that Anglo-American operations in Africa had turned tide of war in Europe and opened way for early collapse of axis.

14 Marshal Pétain rebuked Adm. Darlan for joining Allied cause and told his former assistant to order French troops in Africa not to resist axis forces.

Eddie Rickenbacker and 5 occupants of army bomber, missing in Pacific since Oct. 21 were rescued by U.S. flying boat, navy announcement revealed.

15 Major naval victory off Guadalcanal scored by U.S. fleet over Japs, who lost 28 ships sunk—including battleship, 8 cruisers, 6 destroyers, 12 transports—and 10 ships damaged, against U.S. losses of 2 cruisers and 7 destroyers; battle was fought Nov. 13–15.

Adm. Darlan proclaimed protectorate over all French North Africa and named Gen. Giraud commander in chief of all French land, sea and air forces there.

16 Fighting French in London criticized U.S. deal with Adm. Darlan, declaring that they could not accept establishment of a "Vichy regime in Africa."

Gen. MacArthur and staff went to New Guinea jungles to direct Allied operations against Japanese bases at Buna and Gona.

Casualties for all U.S. armed forces as of Nov. 12, 1942, excluding operations in Africa and Solomons, totalled 48,956, OWI revealed.

17 U.S. political arrangements with Adm. Darlan in French North Africa were only "temporary" expedients, justified by military considerations, said Pres. Roosevelt.

British 8th army occupied port of Derna in Libya and pressed westward toward Bengasi.

18 British and U.S. parachute troops landed deep in Tunisia in daring manoeuvre to seize axis airfields; London reports said that Fighting French column of 10,000 men based in Lake Chad area was moving northward toward Libya.

Marshal Pétain gave Pierre Laval dictatorial powers, authorizing the Vichy chief of gov't to make laws and decrees.

All U.S. youths who had become 18 years old since July 1, 1942, were ordered to register between Dec. 11 and 31.

20 Allied fliers sank Japanese cruiser and destroyer in New Guinea area, United Nations high command revealed.

Laval violently attacked Britain and U.S. in broadcast, proclaimed confidence in eventual axis victory.

21 Abandoned equipment littered streets of Bengasi as British marched into Libyan port city.

Adm. Robert withdrew French West Indies and French Guiana from Vichy influence and reached an agreement with U.S. state dep't.

1,600-mile Alaska international highway, linking U.S., Canada and Alaska, was officially opened.

22 Russians opened offensive in Stalingrad area, capturing Kalach on Don river, advancing 40 mi. around Stalingrad's flanks and slaying more than 15,000 nazis.

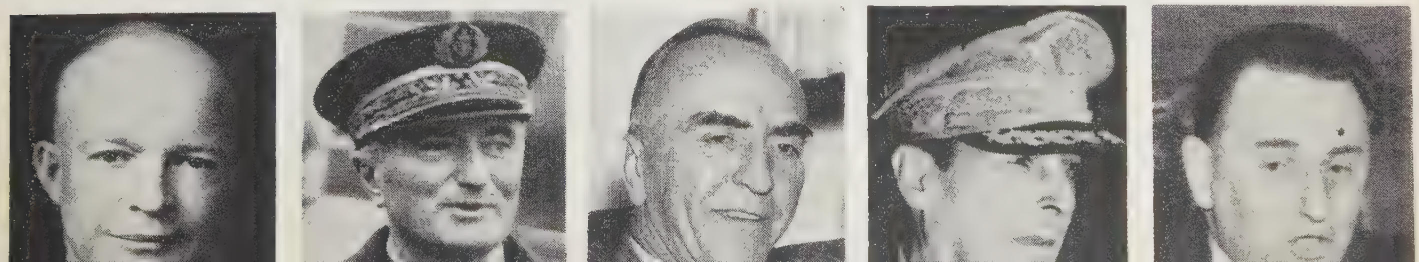
Sir Stafford Cripps left British war cabinet post as lord privy seal to become minister of aircraft production.

23 Dakar came under Allied control as Gov. Gen. Pierre Boisson of French West Africa decided to submit to leadership of Adm. Darlan.

Russian troops occupied Serafimovich and Chernyshevsk in Don river bend.

The pictures on this page are, left to right:

EISENHOWER	Nov. 8
DARLAN	Nov. 13
RICKENBACKER	Nov. 14
MAC ARTHUR	Nov. 16
HENDERSON	Dec. 17



NOVEMBER—*Continued*

24 **Australian forces entered Gona** while U.S. columns advanced to positions a mile from Buna, N.G., Allied communiqué said.

Three German-Americans who helped Herbert Hans Haupt, executed nazi saboteur, were sentenced to death for treason by federal court in Chicago.

Jan Valtin, author and former secret agent for Germany and U.S.S.R., was arrested by U.S. immigration authorities, and held for possible deportation to Germany.

25 **WLB authorized employers** to put women workers on parity with men and give them equal pay for equal work.

Wendell Willkie, speaking at Toronto, criticized by inference U.S.-Darlan arrangement, warning that “moral losses of expediency” always outweigh temporary gains.

26 **Allied bombers sank two Japanese destroyers** guarding convoy that attempted to land fresh troops in Buna area of New Guinea.

27 **French scuttled most of their fleet** in Toulon harbour as Germans moved into naval base city, Vichy dispatches said; Hitler, in letter to Marshal Pétain, said seizure of Toulon was forced upon him by “treachery” of high French officers.

28 **Russians routed 5 divisions,** captured more than 500 populated places and killed 10,000 Germans in surprise offensive in Velikie Luki zone near Latvian frontier, Moscow dispatches said.

29 **Prime Minister Churchill warned Italian people,** in radio broadcast, to oust their leaders or suffer prolonged air attack on their cities.

Coffee rationing went into effect throughout U.S. on basis of 1 pound every 5 weeks for persons over 15.

DECEMBER

1 **U.S. naval squadrons** repulsed new Japanese attempt to land on Guadalcanal, sinking 6 warships and 3 merchantmen and killing estimated 5,000 Japanese troops; 1 U.S. cruiser was lost and “other vessels” damaged.

British warships sank 3 axis destroyers and 4 cargo vessels bound for Tunisia, British admiralty revealed.

Nationwide gasoline rationing, affecting 27,000,000 U.S. motor cars and 5,000,000 motorbuses and trucks, went into effect.

2 **Mussolini assured his people** that axis victory was certain, but urged civilian noncombatants to evacuate industrial cities.

3 **Loss of 16 Allied vessels** in North African landing operations announced, including 5 U.S. transports; British lost 10 ships, including aircraft carrier, 2 destroyers; 1 Netherland’s destroyer was sunk.

4 **In first blow against Italian mainland,** U.S. bombers attacked harbour of Naples, sinking cruiser and damaging battleship and another cruiser.

Tébourba, Tunisia, recaptured by axis armies, which also penetrated Djedeida.

WPA was ordered abolished by Pres. Roosevelt.

5 **In sweeping move** to solve manpower problem, Pres. Roosevelt (1) suspended army induction of all men over 38, (2) halted voluntary enlistments of all men between 18 and 38, (3) made Paul V. McNutt virtual dictator over U.S. manpower, (4) put selective service under McNutt’s control, (5) gave him exclusive charge of training workers for war industries.

Real facts of Pearl Harbor attack Dec. 7, 1941, were disclosed by navy; 5 battleships, 3 destroyers, 1 minelayer and 1 target ship were sunk or severely damaged; 3 battleships, 3 cruisers, 1 seaplane tender and 1 repair ship were damaged but quickly repaired; 2,343 in the three armed services were killed and 960 missing.

6 **Sec’y of Agriculture Wickard** was named food administrator by Pres. Roosevelt.

Fliers of 8 Allied nations razed military objectives in nazi-occupied France and Holland in what was described as greatest daylight bombing offensive of war to date.

Creation of postwar Netherlands “commonwealth,” in which Netherlands, Netherlands Indies, Curaçao and Surinam would have internal autonomy, was forecast by Queen Wilhelmina in radio broadcast.

7 **Harrison E. Spangler** was unanimously elected chairman of Republican National committee.

Casualties of U.S. armed forces in first full year of war totalled 58,307, including 8,192 dead and 6,335 wounded, OWI reported.

8 **15 French warships** apparently were still afloat in Toulon harbour, although 195,000 tons of naval craft had been scuttled, Sec’y of Navy Knox revealed.

Gen. Franco told Spain world’s choice was between communism or fascism and indicated he favoured latter.

10 **Nazi broadcast** revealed that Hitler had revamped German high command and made Gen. Kurt Zeitzler chief of German general staff.

11 **Allied capture of Gona** on northeast shores of New Guinea was announced by United Nations headquarters in Australia.

12 **Only 4** of 4,000 U.S. soldiers were lost when 21,936-ton “President Coolidge,” converted troopship, struck mine and sank in south Pacific, navy revealed.

13 **Anton Mussert, Dutch nazi chief,** was made “leader of the Netherlands people” by Adolf Hitler.

14 **Pierre Laval vowed to crush** ruthlessly everything in his path that would prevent him from “saving France.”

Madagascar was formally handed over to Fighting French administration by British government.

15 **Capture of Buna village,** New Guinea, by Australian and U.S. troops was announced by Allied headquarters.

16 **Adm. Darlan denied personal ambitions** in assuming leadership in North Africa, declaring he hoped only to free France and then retire.

17 **Leon Henderson submitted his resignation** as OPA administrator.

Plans to mobilize several hundred U.S. universities and colleges for training men in armed forces were disclosed by Sec’y Knox and Sec’y Stimson.

Adm. Darlan announced that French warships at Alexandria, Dakar and at North African ports would join Allies.

18 **OPA temporarily suspended gasoline sales** to holders of A, B and C ration books in 17 eastern states because of sudden gas shortage.

19 **British offensive in Burma** had gained 40 mi. in first few days of drive, New Delhi communiqué revealed.

Hitler held two-day conference with Count Ciano and Pierre Laval on axis strategy.

Rommel’s Afrika Korps retreated to positions 135 mi. west of El Agheila.

20 **44 nazi planes were shot down** in aerial battle with U.S. bombers that raided airport at Romilly-sur-Seine, France; 6 U.S. planes were lost.

Sumatra was attacked by British aircraft carrier force; R.A.F. naval planes set large fires in Sabang.

21 **Nevada divorces** were ruled valid in all states by U.S. supreme court decision.

23 **Arrival of U.S. troops in Dakar** was disclosed.

24 **Adm. Darlan was assassinated** in Algiers; his slayer, young unidentified Frenchman, was executed Dec. 26; act was termed “first-degree murder” by Pres. Roosevelt.

Pope Pius XII denounced Marxian socialism and “godless” totalitarianism and appealed for new world with freedom of race, religion and political opinion.

Fourth major offensive was opened in Caucasus, where Russians reconquered positions in Nalchik area.

25 **Ten U.S. Flying Fortresses** raided Wake island, Tokyo communiqué said.

27 **Gen. Henri Honoré Giraud** was selected to succeed Darlan as high commissioner of French Africa.

Rationing of virtually all canned vegetables, fruits and soups under “point” system, beginning in Feb. 1943, was announced by Food Administrator Wickard.

28 **Vice Pres. Wallace** in broadcast called for postwar world federation of nations to keep peace and maintain economic and social justice.

29 **Kotelnikovski was captured** by Russian armies, soviet communiqué said.

French Somaliland joined United Nations under aegis of De Gaulle’s Fighting French.

30 **Gen. Giraud announced that 12 persons** had been arrested for plotting death of himself and Robert D. Murphy, U.S. minister in North Africa.

31 **Chinese mission in Washington** prepared to return home; recall was laid to Chiang Kai-shek’s dissatisfaction with the quantity of U.S. aid sent to China.

BOOK OF THE YEAR

Abrasives.

For many years the development of the automotive industry was the major factor in the demand for most of the commercial abrasives, but this shifted to the war program. The accompanying table lists as much of the data on production in the United States as was made available for publication. Sharp increases will be noted in almost every item in the list.

United States Production of Abrasives
(In short tons, or as indicated)

	1938	1939	1940	1941
Aluminous Abrasives				
Corundum*	2,131	2,029	2,989	4,021‡
Emery	..	765	1,046	4,876
Carbon Abrasives				
Industrial diamonds, carats*	1,397,398	3,590,111	3,809,856	2,911,117‡
Silica Abrasives				
Quartz	18,611	34,959	31,865	41,685
Sand (abrasive)	?	668,027	856,309	1,001,814
Sand and sandstone (ground)	237,167	310,512	342,218	487,665
Tripoli	22,188	33,474	30,212	29,301
Silica Stone Abrasives				
Grindstones	4,653	7,917	8,790	13,573
Millstones (value)	$3,743	$11,084	$6,558	$15,579
Pulpstones	1,553	2,517	4,533	1,963
Sharpening stones	511	620	?	?
Silicate Abrasives				
Garnet	2,669	4,056	4,716	5,501
Pumice	65,742	89,159	82,407	117,310
Artificial Abrasives				
Silicon carbide†	25,346	24,206	33,042	44,962
Aluminum oxide†	53,220	50,468	98,531	147,759
Metallic abrasives†	25,771	42,015	50,016	86,309

*Imports; no domestic production. †Includes Canada also. ‡Jan.–Sept. only.

Corundum.—There is no domestic output of corundum in the United States, imports forming the entire supply, mostly from South Africa, where production more than doubled in 1941.

Diamonds.—The demand for industrial diamonds continued, and imports in 1941 were maintained at the same high level that had prevailed in 1939 and 1940. The bulk of the imports are used in machine tools or some type of abrasive work. (*See* also DIAMONDS.)

Emery.—Besides the domestic production the United States normally imports large amounts from Turkey and Greece, but this source of supply was cut off, and there were no imports in 1941, which accounted for the exceptionally heavy increase in the domestic output.

Flint.—Former imports of silex for mill liners and of flint pebbles for use as a grinding medium in tube and ball mills, mainly from Denmark, Belgium and France, were entirely cut off, with the result that imports dropped to one-tenth of their former volume. Domestic substitutes were developed, and in 1941 production increased to 13,561 short tons of pebbles and 3,411 tons of liners.

Garnet.—While the bulk of the United States output of garnet has formerly come from the Adirondack regions of New York, New Hampshire and Vermont, there is a small by-product output in North Carolina, and in 1941 production was started in two localities in Idaho.

Grindstones, Millstones and Pulpstones.—Domestic production is usually supplemented by a small amount of imports.

Pumice.—Italy was cut off as a source of imports, which practically ceased.

Rottenstone.—Having only a limited production, and being closely related to it, the output of Pennsylvania rottenstone is included with that of tripoli.

Sharpening Stones.—Because of the limited number of producers no data were published on oilstones, whetstones, scythestones, rubbing stones and hones. Imports usually amount to about 10% of the domestic output.

Sand and Sandstone.—Included in the outputs reported in the article SAND AND GRAVEL and under sandstone in the STONE article are considerable outputs of abrasive sand and of ground sand and sandstone used for abrasive work. These have been isolated and included in the table on page 17.

Tripoli.—Imports of tripoli have always been small, but have increased somewhat, being 364 short tons in the first nine months of 1941, against 227 tons in 1940.

Artificial Abrasives.—Since they have replaced natural abrasives in many uses, the output of the chief types of artificial abrasives is presented for comparison. (G. A. Ro.)

Accident Insurance: *see* INSURANCE.

Accidents.

In 1942 the accident experience of the United States was drastically affected by the war. Fatalities from all causes showed a decrease of 8% from 1941 experience, 93,000 people being killed in 1942.

Industrial fatalities in 1942 increased 6% over the first ten months of 1941 to a total of 15,700, with proportionate increase in the number of permanent and partial disabilities. Several factors contributed to the increase in the industrial accident rate. More than a million women entered war production work during the year, and there was a tremendous influx of men and boys, many of whom had no previous industrial experience. Physically handicapped and over-age workers were taken into jobs for which there were in many cases inadequate training facilities and few special precautions against accident to such groups. Sub-contracting brought into production many thousands of small plants with little or no engineering for safety in their machines, buildings and processes, and comparatively little safety supervision over their operations.

The ten-month accident frequency rate (number of accidents per million man hours worked) of industrial units reporting in the inter-plant contests of community safety councils was 12.96, a 6% increase over the comparable period of 1941. The average rate of National Safety council members in six of its sectional contests was 9.01, an 8% increase over the year before.

Farm deaths, on which accident data are difficult to obtain, increased slightly during 1942. The drain on the younger and more vigorous farm workers for the armed services required the employment of many persons less accustomed to the tasks of the farm.

Deaths from Accidents in the U.S.A., 1942 and 1941

	1942	1941	Change
All accidents*	93,000	101,513	— 8%
Motor vehicle	27,800	39,969	—30%
Public (not motor vehicle)	15,500	15,000	+ 3%
Home	30,500	30,500	0%
Occupational	18,500	18,000	+ 3%

*The all-accident totals include deaths of military personnel, not shown separately. Motor vehicle deaths include some deaths which are also shown in other categories, such as occupational and home. The 1941 all-accident and motor vehicle totals are U. S. Census Bureau figures. All others are National Safety Council estimates.

WORKER DEMONSTRATING a principle of safety—use of a belt to prevent falls from ladders and other high places. The National Safety council and other agencies intensified the campaign against industrial accidents in 1942 as employment in war plants rose to new high figures

Fatal home accidents during 1942 occurred with approximately the same frequency as in 1941, totalling approximately 30,500 in each year. Public deaths (non-motor vehicle, drowning, sports, firearms, etc.) increased 3% over the previous year.

The number of fatal accidents to men in military and naval service increased in 1942. Whether this increase was in proportion to the larger number of men involved was not subject to estimate. The term "accident" here excludes injury due to enemy action.

The greatest single disaster to the civilian population was the Boston night club fire of November 28, in which some 500 persons were fatally injured. In the south central states spring tornadoes took 250 lives.

Coal mining fatalities to Nov. 1, 1942, rose 12% to a total of 1,166. Steam railroad deaths in the same period rose 6% to a total of 4,405. Two-thirds of this latter increase was suffered by employees of the roads. Increasing employment in these industries was of course responsible, at least in part, for the accident increases.

The serious nature of U.S. manpower loss through accidents was fully understood by accident prevention agencies. Local safety councils, insurance companies, state and federal agencies, and the National Safety council intensified accident prevention efforts during 1942 in order to prevent this loss to U.S. productive power.

The United States Office of Education, in collaboration with the United States department of labor, instituted nation-wide programs of safety education intended to reach foremen, supervisors and all men and women employed in war production who might profit by such instruction. This training was in the form of a 96-hour course given through nearly 100 colleges and technical schools throughout the country. Some 26,000 men and women had completed or were enrolled in these courses at the end of 1942.

Following President Roosevelt's request of Aug. 1941 for greater effort to stop the loss of productive manpower through accidents, the National Safety council launched a nation-wide campaign, attempting through radio programs, pamphlet materials to industry, field service, school organizations, local safety councils and other agencies to reduce accidents to war workers, whether on or off the job. Substantial support of this effort was received from industrial leaders, government agencies and the general public.

The national accident situation in 1942 produced a more general realization that accident losses are a serious drain on the nation's resources, both in peace and in war, and that greatly increased safety efforts are needed, from the economic, as well as the humanitarian viewpoint. (*See* also Death Statistics; Disasters.) (R. L. Fo.)

Traffic Accidents.—The total of 27,800 deaths in 1942 was 12,200 less than in 1941, when an all-time high mark of 40,000 deaths was reached. This represented a reduction of 30%. The traffic toll was the lowest since 1927. Of the 27,800 persons killed, approximately 18,500 were workers. This represents a heavy drain on vitally needed manpower.

Wartime restrictions on speed and travel and the adoption by many cities and states of more modern traffic control techniques were the chief factors contributing to the reduction in the number of deaths.

In addition to the fatalities, 1942 traffic accidents resulted in approximately 1,000,000 non-fatal injuries, 80,000 of which left some permanent impairment.

An outstanding U.S. achievement in 1942 was the development of the "Wartime Highway Traffic program" and its sponsorship by 30 national organizations interested in traffic safety and conservation. A major objective of this program was the conservation of manpower and man hours through traffic accident prevention. The program, which was published in full in the *Congressional Record* on Dec. 15, 1942, set forth specific recommendations under the general headings of police control, engineering, legislative action, training, motor vehicle administration and public participation.

Regulatory laws or ordinances for traffic control under such wartime emergencies as blackouts and air raids were enacted by the various states and by local governing bodies. Following establishment of the nation-wide 40-mile-an-hour speed limit (and the later reduction of this speed limit to 35 mi. an hour) supplemental legislation to effectuate this conservation measure was adopted in many localities.

The American Association of Motor Vehicle Administrators instituted a campaign for strict enforcement of the 35-mile speed limit by suspension of motor vehicle registration privileges and by suspension and revocation of drivers' licences.

A "War Traffic Control" program was developed for the Office of Civilian Defense by the International Association of Chiefs of Police, and enforcement officials devoted considerable thought to the control of traffic during possible wartime disasters. Attention was given also to alleviating traffic congestion and conserving man power by reducing the number of accidents in certain key military and industrial areas designated by the U.S. Army Transportation corps as being in greatest need of traffic control assistance.

New training techniques, including use of films and the holding of summer training camps, were developed for 325,000 boy and girl members of school safety patrols in 3,500 communities. The patrols received greater recognition during 1942, as many police officials found it impossible to continue to assign men to school crossing duty. A national program of school bus driver training was inaugurated by the American Automobile association in co-operation with the Office of Defense Transportation and the United States Office of Education. Another development was the inauguration of an Office of Civilian Defense instructor training program in emergency driving.

The training of traffic enforcement personnel and of traffic safety educators continued on a stepped-up basis in 1942. The Northwestern University Traffic institute, principal training agency for traffic police, substituted two four-month courses for its customary nine-month course in order to double its output of trained traffic administrators. Traffic control training was offered also to military police. The New York University Center for Safety Education, principal training agency for traffic safety educators, co-operated closely with the United States Army Quartermaster corps. The Yale University Bureau for Street Traffic Research discontinued its training of graduate students in traffic engineering for the duration, but continued to devote its resources to consulting and research activities in traffic control and transportation matters closely allied with national defense and the war effort. (*See* also Industrial Health.) (R. E. Rh.)

Aden. Aden is a British colony, seaport and territory in Arabia, situated in 12° 45′ N. and 45° 4′ E., including Perim island, etc., in the strait of Bab-el-Mandeb between Africa and Arabia; area 80 sq.mi.; pop. (est. 1939) 48,338. Aden protectorate, including Sokotra on the Red sea coast, 112,000 sq.mi.; pop. (est.) 600,000. Governor: Sir J. Hathorn Hall. Language: English and Arabic; religion: Mohammedan.

History.—During 1942 Aden's many activities as an important port of call for allied ships engaged in war service continued unmolested by enemy attack. The revenue remained buoyant, but the index figure for the cost of living rose from 195 in Dec. 1941 to 229 in July 1942. By Oct. 1942, Aden's total gifts for the war effort, including an interest-free loan of £95,000, had risen to £165,100.

Two important visitors during the year were the duke of Gloucester, in the course of his six months' tour of war areas, and Dr. Smart, medical adviser to the colonial office, on a tour of inspection of the medical services.

In the spring, W. H. Ingrams ceased to be chief secretary of Aden and went to Makalla as resident adviser to the Hadhramaut states, and as British agent for the eastern protectorate. He was succeeded as chief secretary by R. S. Campion, who in the absence on leave of the governor, Sir John Hathorn Hall, became acting governor. Relations with the Yemen remained friendly throughout the year.

In Britain the British council set up a Muslim centre for the considerable Adenese community settled in Cardiff, Wales.

Bibliography.—Harold Ingrams, *Arabia and the Isles* (1942).
(L. E. Be.)

Finance.—Revenue (1939–40) Rs.27,22,901; expenditure (1939–40) Rs.19,64,583; currency, legal tender: rupee (Rs.1) = 1*s.*6*d.*, or approximately 30 cents U.S. in 1942.

Trade and Communication.—External trade, 1939 (merchandise and treasure on private account): imports, by sea Rs.5,78,56,697; by land Rs.22,76,258; exports, by sea Rs.3,37,72,025;

ANTI-GOSSIP POSTER distributed to taverns throughout the United States in 1942 by a distilling company

by land Rs.22,11,555; (treasure) imports Rs.37,00,871; exports Rs.20,22,690. Communications: shipping (1939) 2,004 merchant vessels (1,300 British) entered, total tonnage 8,005,763 net tons; motor vehicles registered (Sept. 30, 1939) 733 cars and taxis, 207 commercial vehicles.

Production.—In 1938–39, tobacco (approx. value of crop) Rs.500,000; salt 282,994 tons; (export) 248,784 tons; coffee (export) 4,900 metric tons.

Advertising.

United States.—Practically all significant changes in advertising in 1942 resulted from the war. Perhaps the most outstanding change was the shift to helping the war effort. Early in the year there was confusion as to the precise part advertising should play in business, government and the war.

The government recognized the usefulness of advertising in furthering its war aims. It used paid advertising extensively to promote recruiting of army and navy personnel, to sell war bonds and stamps, and to publicize various drives. Individual companies also co-operated generously in paying for advertisements in connection with salvage drives, grease and fat conservation, and similar campaigns. Retail promotion became an important channel of wartime information as typified by the campaigns on ceiling price compliance, conservation, Red Cross and war bonds and stamps. Another change was the growing tone of social responsibility, as expressed in the trend toward informative copy.

In the spring of 1942 the Advertising Council, Inc., was organized by advertisers, advertising agencies, magazines, newspapers, radio, direct mail, mechanical craftsmen, and other branches of advertising. The council was designed to offer to the government the volunteer services of every type of talent and experience relative to the creative or the administrative phases of advertising, merchandising and marketing. In its first year the council handled more than 40 campaigns for the numerous government departments having informational problems.

Many newspapers and magazines increased subscription rates to offset higher costs and shrinkage in advertising revenue without a retarding effect on circulation. Some mechanical changes in printing publications were made, due to anticipated shortage of paper, chlorine and metals, and to fewer ink colours. Some papers printed fewer pages and a number of magazines cut down page sizes.

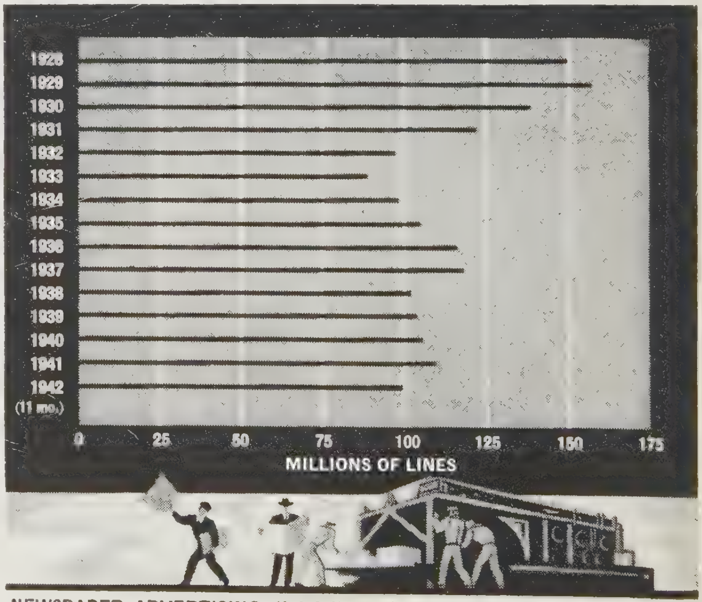
Protection of advertising agency credit through re-establishment of cash discount by Curtis Publishing company and McGraw-Hill Publishing company, and by the radio networks, had a far-reaching effect and obviated a larger capital provision by agencies than hitherto had been needed.

Advertising volume held up remarkably well in 1942. During the first few months after the United States' entry into the war, there was a considerable decrease in volume as compared with 1941. Then a swing upward brought it almost abreast of previous years. In the United States, advertising expenditures were $1,800,000,000 in 1942, a decline of 6.3%. Newspaper linage decreased 5.4%. Dollar volume of magazine advertising decreased 1.5%; radio increased 8.7%; farm paper advertising declined 2.2%; outdoor decreased 19.4%; direct mail decreased 7.9%.

Copy and Layout.—Advertisers faced wholly changed conditions. Some advertisers, confronted by a shortage of their product, used advertising to explain the shortage or to instruct present owners or users of the product in its conservation. Others whose plants were totally converted to war work, hoping to keep alive their product's name, turned to reporting their part in the battle of production. All advertising took on a patriotic fervour, illustrated with pictures, tanks, planes and military men.

The year 1942 opened with a rush of advertisements designed to prove that America's salvation depended on the production of a given product. Copy floundered in a hopeless effort to be patriotic and yet tell the story of the company signing the advertisement. Then a sense of balance returned and advertisements began to tell, in factual statements, what American industry was manufacturing and the job that America as a nation had to do. The cartoon-continuity technique, popular in prewar years, fell off considerably as it did not lend itself to the dignity which advertisers felt was now necessary.

Magazines.—In 30 magazines, 48% of nonfiction content and



NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

65% of the editorial matter were devoted to war themes. Both editors and advertisers furnished information highly important to readers and co-operated in promoting conservation and building morale. They co-operated directly with the government in distributing messages with regard to the purchase of war bonds and stamps. Various periodicals sponsored nutrition programs and urged consumers to do their part in making home, community and country ready, efficient and strong; to buy carefully, to take care of articles in use and to waste nothing.

Magazine readers continued to increase. Net paid circulation of 78 leading magazines increased 4,285,513, or 7.2%, during the first six months of 1942 over the corresponding period in 1941. Many magazines reached an all-time high during the year in both circulation and revenue; others reported substantial gains. In spite of priorities causing heavy restrictions in the manufacture and sale of consumer goods, the year as a whole showed a volume approximating 1941 levels. (*See* also NEWSPAPERS AND MAGAZINES.)

Newspapers.—Newspaper advertising declined slightly from the "good" level of 1941. In 52 cities it decreased 6.1% for the first 10 months of 1942 from the comparable 1941 period. The bulk of this decrease was in automobile linage. Department store linage was down 2.3%. Profits also decreased because of higher costs and taxes and a decline in local as well as national linage. (*See* also NEWSPAPERS AND MAGAZINES.)

Radio.—See RADIO.

Direct Mail.—A reduction of about 8% occurred in this field. Advertisers and printers weighed the services of printed promotion in the war effort and in saving time and money. This resulted in the elimination of frills and unessentials. The government made no restrictions on the essential and helpful uses of direct mail promotion.

Early in 1942, rumours of a paper shortage threatened the use of direct mail. These rumours, however, were shown to be groundless. The Graphic Arts Victory Campaigns committee was organized to assist advertisers in their effort to tie in with government themes.

Car Cards.—Revenues showed a steady upward trend during the year due to reduction in automobile travel and the advent of millions of factory workers. Passengers in the United States reached an estimated total of 20,000,000,000 in 1942, an increase of about 25% over 1941. The volume of transportation advertising was up about 33%. Advertising rates were raised 10% to 15% in 1942 but many large systems made no increases.

In March the National Association of Transportation Advertising, Inc., was formed to co-ordinate the work of the industry, to maintain standards of practice, and to engage in research and promotion work.

Outdoor.—This medium suffered more than others because of abrupt changes in circulation due to population shifts to war production centres and military camps, as well as dimouts by night, which considerably altered the traffic flow on city streets in both volume and direction.

Auditing of outdoor circulation was interrupted for the duration because of lack of manpower to make the count and obsolescence of the audits on account of population shifts. However, checks indicated that the total street travel was greater than ever before. Lessened motor travel was offset by increased travel on foot and in mass vehicles.

Point of Purchase.—Volume of display material was generally down during the year due to restrictions on products and lack of manpower.

Screen Advertising.—This new medium was curtailed by a War Production board order forbidding the use of film for advertising because of the necessity to save chemicals needed for war materials.

Retail.—In 52 cities retail advertising for 10 months of 1942 was off only 2.6% from the previous year. Due to government wartime regulations affecting delivery and passenger car trade, direct mail as a medium gained considerably during the latter part of the year.

Retail copy became more informative and emphasized usefulness and quality. Many stores discontinued their traditional store-wide sales events. As part of their sales promotion and advertising efforts, many stores set up centres of information to aid consumers in solving wartime problems by providing nutrition courses, first-aid courses and sewing schools.

Consumers.—An answer to consumer complaints was the growth of informative labelling and advertising. The latter part of 1942 saw the beginning of experiments in self-selection of merchandise by the consumer in practically all types of department and specialty stores, with open displays accompanied by printed information.

Through organized educational work by the Committee on Consumer Relations in Advertising, sponsored jointly by leading media and the American Association of Advertising Agencies, a marked improvement in consumer relations with advertising resulted. The committee dealt with consumer leaders, women's clubs, church groups and educators, giving facts scientifically obtained and impartially presented, and encouraged training in choice-making, market selection and use and care of products.

Research.—Advertising research, as such, took rapid strides during 1942 and the use of syndicated services grew considerably. People studied advertising themes more than ever before. Many studies were made during the year to determine policies with regard to government regulations and related subjects.

Great Britain.—After the reduction of newspapers from 24 and 36 pages to 4-page sizes in 1941, there was discussion of rationing advertising space. Practically all colour printing was discontinued, except for government posters, as well as catalogues, direct-mail leaflets and similar pieces. More than 170 publications disappeared from the newsstands by the end of 1942. On the other hand, 30 new periodicals were started and the total circulation of periodicals was up about 25%.

Copy tended to stress the recognition of Great Britain in a "total war." Service advertisements were run both by government and private industry. Advertising was still telling a sales story as changes and cheaper materials became necessary in products. However, in spite of all the curtailments, advertising in England was doing a wartime job in finding new ideas to build morale and help protect the people. As stated by Sir Gerald Campbell of the British embassy at Washington: "Advertising as a moulder of public opinion and an influence in public attitudes can be a powerful weapon in total war."

Canada.—Government-paid advertising helped to offset linage losses during 1942 in both the newspaper and magazine field. These media were used extensively to publicize Victory Loan campaigns and educational campaigns for housewives, consumers and business firms.

Government advertising in Canadian magazines was increased from a few thousand lines in 1940 to 114,600 lines during the first 11 months of 1942.

South America.—In South America, Central America and the West Indies, advertising volume for 1942 was off approximately 40% as compared with 1941. Priorities, scarcity of shipping space, inability to pack in tin containers made it practically impossible for many firms to get their goods to export markets. Therefore, a number of manufacturers used purely institutional copy to keep their products and names before the public. A significant change was the increased number of advertisers who used general Latin-American media, such as the Spanish edition of *Reader's Digest,* instead of media in each country.

In Argentina, newspaper advertising dropped 9% under 1941 while magazine advertising decreased 2%. Circulations declined due to the shortage and high cost of paper, most of which must be imported. Radio advertising increased. The Argentine government eliminated all advertising on national highways and prohibited advertising involving special offers or prize contests based on chance.

In Brazil, newspaper and magazine volume generally remained about the same. Decline in advertising by automobile and oil companies was made up by other products whose sale had increased during the preceding two years.

BIBLIOGRAPHY.—Mark Wiseman, *The Anatomy of Advertising* (2 vol.), and Neil H. Borden, *The Economic Effects of Advertising.* (D. ST.)

Afghanistan. A Muslim kingdom lying between India and Iran; area 250,000 sq.mi.; pop. (est. 1940) 10,000,000; chief towns: Kabul (cap., 80,000), Kandahar (60,000), Herat (50,000), Mazar-i-Sharif (30,000). Ruler: Muhammad Zahir Shah; languages: Persian, Pushtu, and some Turki in the north; religion: Mohammedan.

History:—Little news of moment was available during 1942. The country continued in the path of strict neutrality. After the king, Zahir Shah, had formally opened the Loe Jirga (Grand Council) in Nov. 1941, the foreign minister took the opportunity to reiterate the government's determination to maintain neutrality and to follow a peaceful policy. In July 1942 the king again reaffirmed his country's policy of neutrality "provided Afghanistan is left unmolested." In June diplomatic relations with the United States were opened.

Education.—Elementary schools exist throughout the country, but secondary schools exist only in Kabul and provincial capitals; both are free. There were, in 1940, 130 primary schools and 1 normal school for teachers in Kabul. In addition, there were 4 secondary schools and 13 military schools. Kabul university was established in 1932; only a medical faculty existed in 1940.

Defense.—Army, compulsory service; peace strength 60,000.

Finance.—Revenue and expenditure about rupees (Afghan) 150,000,000; currency; Rs. 3.95 (Afghan) = Rs. 1 (Indian). Rs. 1 (Afghan) in 1942 = 5*d.* or 8.4 cents U.S. approximately.

Trade and Communication.—(1939–40) Exports to India: Afghan merchandise Rs. 3,97,06,681; treasure Rs. 16,655; non-Afghan merchandise Rs. 2,008. Imports: Indian produce Rs. 72,79,399; other produce (imported through India and in transit) Rs. 1,96,25,197. Exports are Persian lambskin, carpets, fruit, wool and cotton. Roads: trade routes, Kabul to Peshawar (India), 210 mi., and Kandahar to Chaman, 70 mi.; there are about 2,265 mi. of unmetalled roads connecting the chief towns. At the beginning of 1941 there were five wireless stations in the country.

Agriculture.—Wheat, rice, millet, maize, sheep, Persian lambskin, wool (1938) 6,800 metric tons.

Agriculture. **Crops.**—For 33 crops of the United States, record-breaking production was the rule in 1942. Since the acreage of crops was not changed much, the huge production was the result of high yields per acre (Table I). Crop yields in 1942 were 36% above the 10-year average and almost 15% above the three previous record yields in 1937, 1940 and 1941. Never before had a record production been followed by another record that was 15% more than the previous one.

This huge output of food was due primarily to the weather. There was a combination of favourable weather conditions in 1942 for every crop in every important agricultural area of the United States. In addition, there had been five unusually good preceding crop years, 1937 to 1941. These favourable years had a cumulative effect on U.S. production of livestock products and the building up of livestock inventories on farms.

The uniformly good weather conditions that prevailed throughout the United States is shown by the farmers' estimates of yields of all crops in percentage of normal. Except for a few cotton and intermountain states, relative crop yields per acre in 1942 were excellent. Even in these areas, crop yields were good. Texas was the only state reporting substantial areas of average yields. There were no areas that reported poor crops or crop failures.

Exceptional crop production occurred in the Great Plains area, where there were good moisture conditions from Montana and the Dakotas to Texas. Wheat yields were very high; in some areas the wheat crop of 1942 was worth more than the land upon which it was produced.

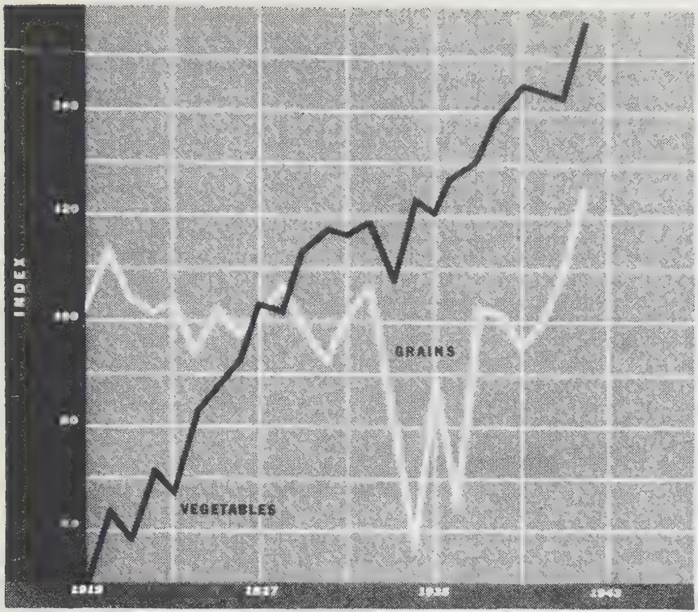
The yields of 1942 may be better understood by comparison with another year. The crop yields of 1939, the first year of World War II, were 14% above the 10-year average for the United States. In that year the only large areas with excellent crops were those east of the Missouri river, north of the Ohio, and on the Pacific coast. The south had a considerable area of good and average crops. The Great Plains from North Dakota to Texas had large areas with crop failures, poor crops and average crops.

The production of oil-seed and vegetable crops made large percentage gains in 1942. Since the '20s, the production of vegetables and of oil-seeds had approximately doubled.

There were not any restrictions on any of these crops except cotton-seed. However, the expansion of soybeans far more than compensated for the government's restriction of cotton-seed. During the '20s, cotton-seed supplied 85% of U.S. home-grown vegetable oils, and in 1942, 40%.

Livestock Products.—The 1942 production of milk, meat, eggs, poultry and wool was likewise unparalleled in U.S. agricultural history. Lard was the only exception, and its production was only 1% less than the largest in history. Low OPA ceiling prices for lard retarded its production. The corn-hog ratio was favourable, calling for more and fatter hogs, but the lard-hog ratio was unfavourable, calling for more hogs, not more lard.

The production of dairy products steadily increased; but the rate of increase for 1942—about 4%—was less than that for 1941—about 5%. Butter production increased steadily with the expansion in milk production until 1942, when it decreased about 5%, in spite of the fact that milk production continued to expand. This decline was due to the rising consumption of whole milk and the increasing production of other dairy products. Since these advances were greater than the increase in milk production, milk and cream were drawn from the nation's greatest reservoir



INDEX NUMBERS of the U.S. production of market vegetables and grains, 1919–42 (1923–32=100)

of dairy products—milk for butter.

The production of cheese in the United States in 1941 and 1942 was the largest on record. The 1941 production was about 20% larger than 1940; and in 1942, production exceeded 1941 by about 25%. This expansion was due to a favourable butter-cheese price differential. Prices of cheese were considerably higher in relation to prices of butter than had usually been the case.

The 1941 production of evaporated milk was more than twice the 10-year average and 50% above that of 1939, primarily because of the stimulating effect of government purchases for lend-lease. The 1942 production was greater than that of 1941, but the rate of increase fell off when government purchases declined. There was a rapid expansion in the production of dry skim milk for human consumption in 1942. Conversely, the production of dry skim milk for animal feed was considerably less than in 1941. The farm sales of chickens during 1942 were almost one-fifth higher than those for 1941, the previous record. The increases were largest in the west north central and south central states, where feed was abundant in 1941 and 1942 and egg prices were favourable. The farmers not only produced more chickens but fed them to heavier weights. The year 1942 was a record year in egg production, exceeding 1941 by approximately 15%.

The amount of meat produced in 1942 was probably about 15% more than in 1941. The largest increase occurred for pork, about 20%. The production of beef increased about 10%; veal and lamb about 5%.

In addition to the huge production of livestock products, U.S. farmers added to their livestock inventories in 1942. The number of hogs and chickens increased about 25% and 10% respectively, and cattle about 2%. The number of livestock on farms Jan. 1, 1943, was the largest in history for all classes except horses and mules—an aggregate increase of about 11% over Jan. 1942.

Table II.—*Consumption of All Food and Stocks of Food, Exclusive of Wheat in the United States, Expressed in Terms of Pounds of Dry Matter*

Years	Consumption,* 000,000 lb.	Stocks† at End of Crop Year		
		Exclusive of Wheat, 000,000 lb.	In % of Consumption	Days' Supply
1925–29	87,204	2,903	3.3	12
1930–34	86,636	3,534	4.1	15
1935–39	90,048	4,425	4.9	18
1939	92,609	5,504	5.9	22

*Based on "Consumption of Agricultural Products," United States department of agriculture, bureau of agricultural economics, mimeographed report, March 1941.

†The stocks of food are those reported by the United States department of agriculture. The pounds of food consumed and held as stocks were converted to pounds of dry matter based on data in C. Chatfield and G. Adams, "Proximate Composition of American Food Materials," United States department of agriculture, circular No. 549, June 1940.

During World War I, the largest food export from the U.S. was wheat. During World War II, most of the shipments through 1942 were meat and other livestock products. Livestock production is merely a reflection of feed supplies, and the abundant crops of 1937–42 enabled farmers to produce large amounts of livestock products without seriously reducing U.S. civilian consumption.

Unrestricted and without government assistance, financial or otherwise, U.S. farmers stored most of their surplus crops in the most efficient and cheapest ever-normal granary, animals on the hoof.

Commercial Carry-over of Food.—During the decade 1932–42 there had been widespread conviction that the United States was in the possession of large surpluses of food. The conclusion was based on the popular misconception that all available stocks are surpluses. Because of inevitable fluctuations in the weather and, consequently, in food production, it is always desirable to have more food available than is consumed.

There was also much misunderstanding of the size of these stocks and their relation to the total annual supply. In 1939 the consumption of food in the United States aggregated 92,609,000,000 lb. of dry matter (Table II). The stocks of food exclusive of wheat at the end of the 1939 season were only 5,504,000,000 lb. only 5.9% of the annual consumption, representing only about 22 days' supply. During 1925–29, the United States

Table I.—*Estimated U.S. Production and Yield per Acre for 1942 Crops* with Historical Comparisons*

Crop	1942 Yield per Acre	1942 Production	Historical Comparisons	
			Yield per Acre	Production
Field crops				
Corn, bu.	35.5	3,200,000,000	highest	largest
Wheat, bu.	19.8	981,000,000	highest	largest except 1915
Oats, bu.	35.9	1,360,000,000	third highest	largest since 1925

*Based on latest available crop reports. †Pounds.

normally had 12 days' supply of food, exclusive of wheat, remaining at the end of the season.

In 1939, the nation consumed 4,224,000,000 lb. of fats and oils. Stocks were sufficient for about 90 days. The same year, the nation consumed 11,359,000,000 lb. of dry matter in the form of eggs and dairy products. Stocks of these products, 183,000,000 lb., were sufficient for only six days' consumption. The stocks of fresh and cured meats and poultry were 204,000,000 lb., equivalent to eight days' consumption. There were 52 days' supply of wheat and only 22 days' supply of all other foods, such as meat, sugar, dairy products, and the like, if they represented the complete diet of the people.

Obviously, such stocks of food represented only a small part of the contemplated lend-lease exports and an even smaller part of domestic consumption. Therefore, the nation had to look to current production for its own food supply or for any that it expected to give away.

Lend-Lease Exports.—Most U.S. lend-lease food exports in 1942 were the highly prized nutritious animal foods. Although these foods represented less than half the tonnage, they represented more than 75% of the total value. U.S. exports of crops represented a small proportion of total crop production—only about 2%. Lend-lease beans represented about 20% of the crop, peas 15%, fruits 13%, cotton 9%, and tobacco and oil-seeds 5%. Lend-lease grain, potatoes and vegetables were an insignificant proportion of these crops.

The quantity of livestock products exported represented about 7% of the total livestock production. Lend-lease milk and meat represented 6 to 7% of their production respectively, eggs 20% and lard 27%. The production of the 5,500,000 tons of lend-lease livestock products from pastures, grain and roughage was probably equivalent to 6% or 7% of the U.S. crop production of 1942.

Thus, total lend-lease exports in terms of crops represented about 8% of production. Since crop production in 1942 was up 15%, the lend-lease exports were more than offset by increased production.

After deducting the exports of the livestock foods from U.S. production, it would appear that consumption of these products by U.S. soldiers and civilians in 1942 was substantially the same as in 1941. But since the soldiers consume more of the highly prized foods per capita than do civilians, the civilian consumption was probably somewhat below the 1941 level. (*See* also *U.S. Food Requirements in World War II,* below.)

Relation of Crops to Livestock Production.—Since a high percentage of both the nation's food consumption and lend-lease exports for 1942 was derived from livestock production, the relation of crops to livestock should be considered. The problem is confused by the widely varying moisture content of these products. Milk contains only 13% dry matter, and lard 100%. Normally, the nation's per capita consumption is about 800 lb. of milk, 140 lb. of meat, 20 lb. of lard and 55 lb. of poultry and eggs. In terms of dry matter, milk consumption—more than 100 lb.— is slightly more than the combined consumption of meat, poultry, eggs and lard.

A severe curtailment in crop production is followed by a decline in production of all livestock products. The first effect is always on products for which the least feed reserves exist, beef cattle. Hog production, of course, is just a reflection of the reduction in the corn crop. The least violent declines occur in the production of dairy products.

As a result of the drought of 1934, the per capita production of food and feed crops declined 24%. Per capita meat production declined 22%, and poultry and eggs 11%. In pounds of dry matter per capita, the production of these foods declined 10%. The production of lard declined 15%.

Table III.—*Estimated Volume of U.S. Crop and Livestock Production and Lend-Lease for 1942*

Commodity	Production* Tons	Lend-Lease* Tons	Approximate % of Production
Crops			
Feed grains	124,000,000	400,000	nothing
Food grains	33,000,000	425,000	1
Beans, dry	1,000,000	200,000	20
Peas, dry	400,000	60,000	15
Potatoes	13,000,000	75,000	1
Vegetables	12,700,000	135,000	1
Fruits	15,000,000	2,000,000	13

Some of the effects of the drought were delayed until 1935. Based on whichever year was the lower, 1934 or 1935, milk production declined 5%, poultry and eggs 13% and meat 27%. The aggregate production of these foods declined 13%. Lard production declined 48%. If lard is included in the total, per capita livestock production declined 16%.

During the drought of 1934, production of all livestock products declined 11%, whereas consumption declined only 4%. The drastic decline in production was largely offset by added supplies from inventories, 15 lb. of dry matter per capita. In fact, in 1934 the consumption of meat was about normal.

Following the drought of 1934, inventories declined somewhat less than either crops or livestock production—10%. The full effect of the drought on both production and consumption did not occur until 1935. The liquidation was practically over, and consumption was dependent upon current production. Both current production and consumption were 10% below the 1932–33 level.

From the drought of 1936 through 1942, there was a succession of good crops. From 1936 to 1941, the production of food and feed crops per capita increased 43%. The production of milk increased 14% from 1937 to 1942, poultry and eggs 32%, meat 41% and their total 24%. The production of lard increased 81%, and the grand total, including lard, increased 27%.

Regardless of whether there is a sharp curtailment in crop production or unusually abundant harvests, production of meats moves in the same direction and changes approximately in the same proportion as crop production. The production of eggs and poultry moves in the same direction and changes about three-quarters as much. Milk production moves in the same direction, but the change is relatively small.

Farm Labour.—The farm labour problem received much consideration by the government, the farmers and the press in 1942. The government requested the local draft boards to exempt such labour from military duty and it also froze labour on farms. It planned to move subsistence farmers to better land. It considered the importation of Mexican, Cuban and Puerto Rican labour.

The normal movement of surplus labour from farm to city was accelerated by the disparity between farm and city incomes. As farm incomes and farm wages rise, the disparity between farm and city incomes diminishes and the rate of movement away from farms declines.

The press in 1942 publicized the sharp increase in the number of auctions and of farm sales. The usual explanation was a shortage of labour, and consequently it was commonly believed that such sales meant decreased production. The most frequently publicized sales were those of large farms with many hogs and cattle, employing several hired hands. The liquidation of these large farms made the headlines, but their number was very small, and they played a minor role in U.S. agricultural production. When the operator of such a farm decided to quit farming "because of the shortage of labour" the farm did not go out of production as was commonly assumed. In most cases it was divided and operated by several tenants or owners as family-sized units. The family-sized units were not so spectacular but probably produced in the aggregate about as much food as the large unit.

Less spectacular but frequently cited were the sales of the typical family-sized farms. It was again erroneously concluded that such sales arose because of labour shortages and would result in decreased food production. A certain number of sales always occurred because old men retired and young men started farming. The only aspect of the situation in 1942 that called for explanation was the acceleration in the number of these sales.

Normally, young men go in debt, start farming, and when the farm is cleared of debt the operator retires and moves to town. The rate at which they leave farms depends on the profitableness of agriculture. During the prosperous years, characterized by 1910 and 1920, about 22% to 24% of the farmers on Illinois farms were over 54 years of age. As a result of the agricultural depression, the percentages rose to 31 and 35 respectively in 1930 and 1940. Consequently, in 1942 there was more than a normal number of old men operating farms. With the improvement in prices and the abundant harvests, farm income rose sharply and enabled many of the older operators to liquidate their debts and retire.

The same factors control the rate at which young men start farming. During the prosperous years of 1910 and 1920 more than 25% of the operators were under 35 years of age. In 1930 and 1940, the proportion of young men declined to 18% and 17% respectively. Consequently, during 1942, in Illinois and in many other agricultural areas of the United States, there was a large accumulation of potential farmers.

With the military deferment of farm labour, the typical family farms which produce most of the nation's food supply had practically no labour problem except at the peak of the season's harvest. At that time the extra help needed represented a small proportion of the total labour needed to plant and harvest the crop. This was a problem for the farmers to solve in co-operation with local civic organizations. Many women and school children from neighbouring urban areas helped harvest the U.S. crops of 1942. On several occasions in 1942 the U.S. Employment Service and the Department of Agriculture issued appeals for volunteer farm workers, and in some cases transported workers from one section to another where the crops were in danger for lack of hands to harvest them.

Fertilizers.—The outlook for fertilizer in 1942 was clouded by only one element—nitrogen, the use of which was restricted by the War Production board. Phosphorus and potash were relatively abundant. The coastal area of the United States from Maine to Texas is characterized by light soils that require constant applications of commercial fertilizers, including nitrogen. There was, in 1942, practically no reserve of nitrogen remaining from previous applications of fertilizers; and on these light soils there was little natural reserve. This area produces a goodly proportion of the U.S. supply of potatoes, fresh vegetables, fruit, vegetable oils and cotton. Except for the coastal area, the region around the Great Lakes, and other limited areas with intensive crop production, nitrogen restrictions were not a handicap to food production in 1942. The backbone of the nation's food supply, grain, is produced in areas that require relatively little nitrogen.

*Surplus wheat stocks in Argentina and Australia are not considered because of the uncertainty as to the quantities and difficulties of shipping They would probably feed about 25,000,000 persons for one year.

U.S. Food Requirements in World War II.—The problem of feeding the U.S. military forces had not become particularly burdensome in 1942. The average soldier consumed about 25% more food than the average civilian. But since a youth in his twenties consumes more food than an average civilian, the soldiers, sailors and marines probably consumed only 15% to 20% more than they did as civilians.

The food requirements of a military force of 8,000,000 men are equivalent to those of about 8% of the civilian population. Therefore, it appeared that the military forces would get about one-third of the food allotted to "military forces and lend-lease," and U.S. Allies would get about two-thirds. The latter amount represented a deduction from U.S. civilian consumption, whereas the food allotted to U.S. soldiers did not, except insofar as, transferring from civilian to military life, they consumed more because of greater physical activity. If a soldier consumes 20% more food, the additional burden that the nation has assumed is equivalent to adding approximately 1,500,000 additional mouths to the U.S. population of about 134,000,000 people—an addition of only about 1%. Consequently, practically all the additional U.S. food requirements represented by Secretary Wickard's estimate in 1942—25% to 30% of 1943 food production—was to go for lend-lease and not to the U.S. military forces.

Since a certain amount of dry matter, calories or energy is required for body maintenance, growth and physical effort, none of these new demands could be met by reducing civilians' consumption unless it was to be assumed that in the past they had eaten too much.

The plans for such large exports of food raised many problems. How much food would be exported? For how long a period would these shipments continue? To whom would the food be sent? Was the objective the improvement of diets or the prevention of starvation? What types of food should be exported? What types of food could be exported? What effect would the program have on civilian consumption? What government agencies would be in charge?

Though these and other questions could not all be answered in 1942, indications were that large amounts of U.S. food would be required for an extended period of time. The question thus became one of examining the possible sources of additional food supplies. These were at least five: (1) increased production; (2) existing stocks of grain and animals; (3) imports of surplus wheat; (4) reduction in civilian consumption; (5) curtailment in the production of livestock products. (*See* Table V.)

Increased Production.—There was practically no hope of meeting the increased requirements solely from increased production. The farm plant in 1942 was operating at a level not likely to be exceeded for several years.

Existing Stocks and Imports.—In 1942 there were about 600,000,000 bu. of wheat in excess of normal U.S. stocks. This supply would feed about 40,000,000 to 50,000,000 people for one year at a rate of about 13 bu. per capita.[1] Canada had about 400,000,000 bu. of surplus wheat which might be imported and reshipped. This would feed 30,000,000 people for one year. The stocks of wheat in the United States and Canada together would feed about 75,000,000 people for one year. After these stocks of wheat had been exhausted, there, of course, could be no further contribution from this source.

There were also large stocks of food in the form of cattle on U.S. farms. If these cattle stocks were reduced, they would add to food supplies by that amount. However, reducing inventories of cattle would be accompanied or followed by a reduction in the production of meat and milk. Consequently, the liquidation of livestock would in itself make little net contribution. Excess stocks of U.S. horses might feed 100,000 folks for a few years.

Reduction of Civilian Consumption.—If the American people were to reduce their consumption of the highly prized foods—meat, milk and eggs—by 10% and substitute grain, the nation could feed about 3,000,000 more people each year for about 14 years.[2] With a 20% reduction in the consumption of highly prized foods, the nation could feed approximately 7,000,000 persons for about 7 years. With a 30% reduction, it could feed approximately 10,000,000 for about 4 years.

Reduction in Livestock Production.—If livestock production were decreased 10%, the nation could feed 20,000,000 additional mouths, and this could be continued year after year. Such a stretching of the food supply would be due to the consumption of cereals directly, rather than indirectly in the form of livestock products. A reduction of 20% and 30% in livestock production would enable the U.S. to feed 40,000,000 to 60,000,000 additional mouths per year, for an extended period of time.

A reduction of 10%, 20% or 30% in production of livestock would involve the same sacrifice on the part of American consumers as a reduction of 10%, 20% and 30% in the consumption of these highly prized products with no change in their production. In either case, the American consumer would be called on to reduce his standard of living. However, the number of mouths fed under lend-lease or rehabilitation would be far different. If livestock production were continued and the excess above U.S. restricted consumption were shipped, there would be sufficient food for 3,000,000 to 10,000,000 people. If livestock production were curtailed and cereal grain were shipped, there would be enough food for 20,000,000 to 60,000,000 people.

Another important consideration is the fact that a 20% reduction in the consumption of livestock products, with no change in their production, would enable the United States to feed 7,000,000 people for about 7 years, while a 20% reduction in livestock production would enable the nation to feed 40,000,000 people indefinitely.

If the U.S. civilian population were to decrease its consumption (and its production) of the highly prized foods to the standard of the Algerian, the nation could feed about 100,000,000 additional mouths; and if decreased to the Chinese standard, about 200,000,000. Although these estimates are rough, they indicate clearly that curtailing the consumption of highly prized foods with no change in their production, fills the stomachs of only a few million additional people. This was the method followed largely in 1942. Lend-lease exports of livestock products in 1942 represented about 35% of the total amount of dry matter exported, exclusive of sugar, while these foods represented about 30% of the American diet. Goals and official exhortations, calling for increased production of livestock products and decreased civilian consumption by rationing, indicated that a continuation of the same policy was contemplated in 1942. Such a policy could be continued only so long as feed was available for livestock and surplus wheat was available to compensate for the decline in the civilian consumption of livestock products.

The agricultural policy of the United States in 1942 was to curtail the wheat acreage and expand livestock production. If the nation were to assume that there was an overproduction of grain, that the lend-lease and rehabilitation programs would not expand above their level of 1942, and that the paramount problem was to provide an attractive diet for the few rather than to fill the stomachs of the many, a continuation of the policy was justified. If the problem, on the other hand, was to feed the many rather than the few, the most effective way of so doing would be to reduce livestock production.

The forecasts indicated in 1942 that there were tentative plans to export 15% to 20% of the 1943 food production, enough to feed about 25,000,000 persons.

Only by feeding its cereal grains directly to human beings rather than to animals could the United States provide large amounts of food to distressed peoples over an extended period of time. (F. A. Pe.)

Crop Insurance.—The yield from U.S. cotton crops was, for the first time, insured in 1942 to planters by the Federal Crop Insurance corporation. Previously the corporation had for several years provided crop insurance to wheat growers, policies having been issued to more than 400,000 growers a year. Approximately 171,000 cotton insurance contracts, covering 1,500,000 ac., were issued up to March 31, 1942, the final date for filing application for insurance on the 1942 crop. Cotton crop policies were issued in 18 states, but the larger number was for the nine cotton belt states in the following order: Texas, Georgia, South Carolina, Louisiana, Alabama, Oklahoma, North Carolina, Mississippi, Arkansas. Planters had the privilege of insuring for either 50% or 75% of the average per acre production on individual farms. Where there were divided interests, separate contracts were made. For example, if a landlord and a share cropper were beneficiaries on the same crop, a separate contract was made with each. The insurance covered risks resulting from unavoidable hazards such as drought, excessive moisture, plant disease and insect pests. No premiums were paid on poor farming or theft. Nor did the policies afford protection for quality, since the insurance was for yield only.

Shortage of labour and inability to obtain repairs for machinery resulted in a number of cotton planters harvesting a smaller crop than would have been the case under normal conditions. In such instances the insurance corporation adjusted payment of loss after deducting any savings the farmer might have obtained from his inability to follow the usual practices. Premium rates varied widely and were based on conditions pre-

---

[1] Thirteen bushels of wheat contains about the same number of pounds of dry matter as is annually consumed by the average American or the Chinese coolie. The comparisons are based on pounds of dry matter and do not take into consideration balanced rations, vitamin requirements and other nutritional problems. The nearest approach to this diet is that of the Chinese coolie, who consumes about 90% of his food in the form of cereals.

[2] If U.S. civilian consumption of livestock products were reduced 10%, this reduction probably would be offset by an increase in the consumption of wheat, about 44,000,000 bu. per year. At this rate, the 600,000,000 bu. of excess wheat in 1942 would disappear in about 14 years.

U.S. FARMERS worked long after sunset during the spring of 1942 to prepare the soil for a huge wartime crop. Here a farmer of the Red River valley, North Dakota, drags a disk harrow across his field

vailing in particular localities.

Farm Co-operatives.—The 10,600 co-operative marketing and purchasing associations representing 3,000,000 farmer members in the United States concentrated largely on war production in 1942, the Farm Credit administration reported. Co-operative creameries shifted production to the manufacture of spray milk powder when that commodity was demanded because it required less space in shipping. The co-operatives, the FCA reported in 1942, were producing about one-third of the supply of spray milk powder and were furnishing 45% of the milk powder used by the army and navy. Co-operatives were producing about 25% of the dried fruit supply, most of which went to the government. The co-operatives also got behind the movement to produce 750,000 shearling pelts a month from Sept. 1942 to Dec. 1943, as asked by the armed forces. Shearling pelts are skins of lambs having a short wool growth or of sheep shorn a short time before slaughter. They are used as linings of jackets for aviators who fly in subzero temperatures. Co-operatives were also active in operating transportation pools and consolidated truck routes, to conserve gas and rubber. As a further contribution to this effort the usual number of meetings of co-operative members was reduced. The Dairymen's League Co-operative Association of New York was reported to have used wooden tires successfully on the front wheels of trucks in urban milk delivery where speed was not required The wooden tires were made of three sections of wood that fitted into the rim of the wheel and were devised by a veteran wagon maker. The National Machinery Co-operative at Shelbyville, Ind., was manufacturing tractors and various munitions for the army, while 1,400 farmers in New York, New Jersey and Pennsylvania registered their trucks for war emergency service in transporting crops and farm supplies. Owing to the reduced manufacture of farm machinery, co-operatives were active in repair work on old machinery. The Maryland Tobacco Growers association opened three new grading houses equipped with automatic humidifiers and with electrically-driven machinery designed to save labour.

U.S. Farm Income.—At the close of 1942 the department of agriculture estimated the year's United States farm income from marketings as about $15,000,000,000, the highest on record to that date. The increase resulted from a 25% rise in prices of farm products and a 12% increase in sales during the year. This total was an increase of about one-third over that of 1941 and nearly double the average farm income from marketings in the five-year (1935–39) period. It also exceeded the $14,600,000,000 of the high year of 1919, when farmers were still meeting the demand created by World War I. In addition to the cash received from farm products in 1942, farmers received $625,000,000 in government payments. Net income from agriculture per person on farms in 1942 was estimated at about $368, compared to $254 in 1941. The 1942 figure was about 136% of parity (the ratio of per capita farm income to per capita nonfarm income in 1910–14). It was 112% of parity in 1941. Total expenses of farm operations in 1942 were estimated at $8,700,000,000, an increase of 15% over 1941 and about 50% above the average for the 1935–39 period.

With the war program calling for still further increase in farm production in 1943, it was estimated that the income for that year would total $16,000,000,000. Expense of farm operations in 1943 would also be higher—$9,000,000,000 to $9,500,000,000—the department of agriculture forecast.

Farm Machinery.—Manufacture of farm machinery in the United States in 1942 was limited by governmental order to 83% of 1940 production, in order to conserve materials for the manufacture of munitions. Farm equipment output in 1940 amounted to $488,000,000 and was in excess of $700,000,000 in 1941, when there were no restrictions. Production of farm machinery in the

Table VI.—*U.S. Farm Income, 1942 and 1941*

	1942	1941
All crops	$5,748,000,000	$4,312,000,000
Food grains	857,000,000	719,000,000

Vegetables	1,053,000,000	716,000,000
Fruits and nuts	753,000,000	565,000,000
All livestock	8,120,000,000	5,804,000,000
Meat animals	4,399,000,000	2,902,000,000
Dairy products	2,103,000,000	1,743,000,000
Poultry and eggs	1,417,000,000	979,000,000
Government payments	625,000,000	502,000,000

United States for the year ending Oct. 31, 1943, was reduced to 20–23% of 1940 production by Order No. 170, issued Nov. 25, 1942, by the War Production board. Following numerous protests the WPB Jan. 21, 1943, raised the production quota for 1943 to 31%. Implement manufacturers entered 1942 with large inventories of farm machinery owing to the large production of 1941.

The cut of 20–23% in 1942 production was cushioned by this backlog, and it was not until the latter part of 1942, when both the backlog and current production had been practically exhausted, that complaints of a shortage of farm machinery threatening the food supply were heard. Meanwhile farmers were paying mounting prices for used machinery, sometimes more than the price of new machinery, which had been under price control of the Office of Price Administration since May 1942. The OPA later, on Jan. 4, 1943, established maximum price controls on sales of used machinery by dealers and placed price ceilings on used equipment of five major types, whether sold by dealers, auctioneers or farmers. The five types of used equipment included combines, corn pickers, corn binders, motor- or tractor-operated hay balers and tractors, excepting crawler tractors. The OPA ruled that dealers, in selling used equipment, could not add more than 5% or $15, whichever was larger, to their trade-in allowance, purchase price or balance due (if the equipment was repossessed), plus reconditioning cost. On reconditioned machinery the maximum price was 25% or $15 markup, whichever was larger, on the trade-in allowance, purchase price or balance due. Dealers might not in any case charge for used equipment more than 95% of the base price for new machinery. The base price was defined as the manufacturer's list price, f.o.b. factory, currently or last used. Maximum prices by farmers and auctioneers were set at 70% of the base price for machines more than one year old and 85% for those less than a year old. The same ceilings applied to dealers except that machines reconditioned and guaranteed for 30 days might sell up to 95% of the base price.

Members of congress from agricultural states protested that the WPB restrictions threatened to reduce farm production in 1943 and also discriminated against U.S. farmers by establishing export quotas under which various countries might obtain U.S. farm machinery to the amount of 111% to 118% of their 1940 purchases of such machinery. Conversations in implement trade circles asserted that the United States had lost first place as the nation with the most highly mechanized agriculture. This position, it was said, had been taken by Great Britain, which had imported large numbers of tractors and farm machinery.

Farm Mortgages.—The Farm Credit administration emphasized in 1942 a policy of urging farmers, during the period of wartime profits, to liquidate all debts, mortgages and other obligations in order to avoid possible recurrence of the hardships imposed by the slump in farm prices that followed World War I, when many farms were foreclosed. From Jan. 1, 1942, to midsummer, the Farm Credit administration reported, farmers paid $6,000,000 into a special "future payment fund." Previous to 1942 they had paid $2,000,000 into the fund, which, sponsored by the FCA, pays the farmer-depositors the same rate of interest as they pay on loans they have with federal lending agencies and is available to meet future interest and principal payments should farmers lack other funds with which to pay. At the time of reporting this increase in the future payment fund, Aug. 1942, Gov. A. G. Black of the FCA reported that during the preceding year farmers had paid to the Federal Land banks and the Federal Land commissioner $205,000,000 on principal of loans outstanding. Of this amount, $80,000,000 was to pay loans in full. The FCA announced in Aug. 1942 it had sent to the "million or more farmers" with federal loans outstanding copies of a letter from President Roosevelt to Secretary of Agriculture Claude R. Wickard, urging all farmers to pay off debts, "to avoid the unnecessary hardships such as were experienced by farmers during and following the first World War." The letter said further:

> Those who take this advice will be contributing in a real way to the accomplishment of three important objectives. First, by making such payments, they will reduce the farm mortgage debt which might otherwise become burdensome in the readjustment period after the war. Second, use of increased purchasing power to pay debts instead of buying such things as we all can reasonably do without during the war will help keep the prices of such things from rising. Farmers, like all citizens of the nation, fear inflation. Third, repayment to creditors will enable them to buy more war bonds, thereby contributing materially to the war effort.

The peak of the farm mortgage debt was $10,800,000,000 in 1923. It was about $7,000,000,000 in 1940 and declined steadily through 1941 and 1942. (*See* also FEDERAL LAND BANKS.)

Farm Tenancy.—Shortage of farm labour and widespread employment in defense industries, which attracted farm workers to urban jobs, operated to reduce farm tenancy in the United States in 1942. Reports from agricultural communities were that many tenant farmers, particularly share croppers in the cotton areas, preferred to work for owner-operators than to farm on a cropshare or cash rental basis. Not only were the higher farm wages an inducement, but income was more certain, since previous to 1942 it was normal for one-third of the farm tenant families to move every year. The direct cost of this shifting from one farm to another was estimated by the Farm Security administration as $50,000,000 a year. An indirect cost, much higher but undetermined, resulted from such shifting because each tenant took all he could from the land without attempting to build it up. There were 2,800,000 farm tenant families in a total of about 6,100,000 farm families in 1941, the FSA estimated. That figure was a slight decrease from previous years owing to the government's efforts to reduce farm tenancy, which had been growing at the rate of 40,000 families a year. Between 1935 and 1942 the FSA had advanced in loans and grants approximately $520,000,000 to rehabilitate 874,000 farm families by aiding tenants to become farm owners and by aiding inadequately-equipped farms. Of this sum, about $200,000,000 had been paid back, it was reported in 1942. O. R.)

Great Britain.—No change took place in 1942 in the form of state control of farming exercised by the ministry of agriculture through county war agricultural committees; but one interesting development was the formation in each county of a technical development committee responsible for advising farmers of improved technique in crop and livestock production.

The main emphasis remained on the production of foods for direct human consumption. First priority continued to be given to milk, and an intensive campaign was organized to maintain and if possible increase production. First, on milk-producing farms the primary call on the arable land was toward self-sufficiency, the balance of the land only to be used for crops for direct human consumption. Second, strenuous endeavours were made to maintain the numbers of dairy cows and, in particular, to encourage the development of winter milk production. Each county was given a "milk target." The third measure adopted was the new milk-testing scheme for the improvement of keeping quality, especially during the summer. The fourth measure was the control by the veterinary profession of the four major diseases affecting dairy cattle. The success of these various measures may be judged from the fact that in the first seven months of 1942 farmers' sales of milk were 15,000,000 gal. above the average of the three years before the war.

After milk, wheat, oats, potatoes, sugar-beet and certain green vegetables continued to be the priority products, but rye was

added on soils unsuitable for wheat. The wheat acreage was up by a third on the prewar figure, and a flat rate subsidy of £3 per acre was introduced to stimulate its production still further especially on poorer soils. The acreage of oats rose from 2,500,000 to 4,000,000 ac., and the potato acreage by 70%. The sugar-beet crop was expected to yield over 4,000,000 tons which should more than suffice to provide the civilian sugar ration. Production of farm vegetables was stepped up by 1,500,000 tons on the prewar figure. In addition farmers were growing 12,000,000 tons more animal feeding stuffs for their own livestock. By June 1942 the total arable acreage had been increased from 12,000,000 ac. prewar to 18,000,000 ac.

While the area of corn crops harvested in 1942 was the largest in Britain's history intensive efforts were also made to raise the level of production for existing arable land by an increase of 5% in output from every acre. An encouraging feature was the number of "C" farms, the least efficient group, which were upgraded to "B" and the number of "B" farms which became "A." There was again more lime available and sufficient home-produced nitrogen, but phosphates and potash were limited and a rationing scheme for their allocation and a crop priority list was evolved. Alternative methods for supplying potash for the next cropping season, particularly for the appreciable areas where a deficiency exists, were, for some crops, the application of agricultural salt, but the major contribution was expected to come from an increased production of farmyard manure. For this purpose the bulk of the greatly increased 1942 straw harvest, some of which would go into paper manufacture, some to be converted into useful fodder by the soda treatment method, had to be utilized.

Land-improvement schemes on existing tillage areas and upland pasture and large-scale reclamation of marshlands continued.

Seasonal conditions were only fair and many districts suffered through lack of rain during the growing months. The hay crop was good and in general got in under excellent weather conditions. Grain crops were also generally good and although harvest conditions were difficult in many areas, the total weight of threshed grain was expected to be the largest ever produced in Britain. Potatoes and sugar-beets were expected on the whole to produce crops above average. Root crops were variable but the August rain improved them in many areas. Pastures were bare and autumn grass much less plentiful than in 1941.

The supply of labour continued to be a limiting factor, though important steps were taken to adopt substitute labour, especially through the Women's Land Army of some 40,000 strong. In Dec. 1941 a national minimum wage of £3 per week for able-bodied adult male farm workers was introduced.

The further mechanization of farm operations was a major factor in coping with the increased load of work. In 1942, farm tractors numbered over 100,000, while 1,250 combine harvesters were in use on the wheat crops. Early in 1942 an agricultural machinery development board was set up to guide and direct the improvement of existing and new machines.

The ministry of food continued to buy at fixed prices most of the major farm products. In Feb. 1942 (later in the case of milk), a new scale of prices was announced to offset the increased costs resulting from the new legal minimum wage rate. The 1942 budget further limited the privileged position of farmers in respect of income tax, the limit for assessment on rental rather than on profits being further reduced from £300 to £100.

British Empire.—Shipping and transport remained the primary problem of the dominions during 1942. The proximity of Canada placed it in the first rank of food importers to the United Kingdom; to meet British demands Canada made a major shift away from wheat to the production of cheese, processed milk and bacon. The government of the United Kingdom continued to contract for the wool clip of the Union of South Africa, Australia and New Zealand. The need to dispense with semiluxury foods seriously affected the fruit-growing industry in South Africa as well as in New Zealand. War in the Pacific added greatly to the already serious problem of transport to the mother country from Australia and New Zealand, while the calling up of manpower for the forces and for munitions, together with shortages of fertilizers, especially phosphates and nitrates, added considerably to the production problems of these two dominions. Ahmed II, Sidi (1862–1942), bey of Tunis, noted scholar and philanthropist, was nominal ruler under the French protectorate of 2,500,000 Arabs, Bedouins, Frenchmen and Jews. He died in his capital, June 19, and was succeeded by his nephew Sidi Mohamed el Tahar.

Ainsworth, William Newman (1872–1942), U.S. Methodist bishop, was born Feb. 10 in Camilla, Ga. He studied for the ministry at Emory college, Oxford, Ga., but for a time served as president of Wesleyan college, Macon, before he was elected bishop in 1918. He served as head of the church in Japan, China and Chosen and was head of the Southern Church in 1937. Bishop Ainsworth, who aided the movement for unification of the Methodist churches, resigned his post in 1938. He died in Asheville, N.C., July 7.

Air Conditioning. The expansion of World War II in Dec. 1941 and during 1942 to include the United States, Mexico, Cuba and most of the Latin-American countries had a profound influence upon air-conditioning products and applications.

Comfort air-conditioning sales and installations for homes, offices, theatres, retail stores and similar applications were practically nonexistent in 1942. This was due to conversion of industry to war work, limitations imposed by governmental regulations, and the scarcity of materials with its attendant requirement of priority rating and allocation.

Industrial and war applications of air conditioning increased in variety and number. Many new process requirements caused the development of new products and new techniques of application.

Sales of new equipment in 1942 were approximately the same as the peak year of 1941 despite the curtailment of comfort and nonessential applications. This meant a decrease in some types and sizes of equipment such as room coolers and small refrigerating units and an increase in the industrial types of equipment.

Applications of air conditioning which were new or of increased importance in 1942 included: (1) the storage, preservation, treatment and preparation of raw materials which are adversely affected by changes in temperature or humidity; (2) in precision manufacturing, assembling and testing, the control of temperature, humidity and air cleanliness to insure uniformly high quality, interchangeability and accuracy of product and accelerated production with reduction in spoilage and waste; (3) in the storage of vital metals, tools, dies and instruments to prevent corrosion and deterioration; to minimize chemical reactions; and to minimize changes in volume, weight and shape; (4) in research and development to simulate unusual atmospheric conditions to be encountered by the armed services and their equipment all over the world; (5) in the processing of food to precool and quick-freeze prior to shipment; (6) in the production, storage, transportation and distribution of foodstuffs; (7) in blackout plants, air-raid shelters, airport control towers to remove excessive heat and humidity which would otherwise make impractical such spaces for their intended uses; and (8) blast-furnace air conditioning to increase output.

New products resulting from the above applications included new refrigerating condensing units and systems in "stage compression" to attain temperatures down to −100° F. or lower, heat exchangers, special test cabinets, stratosphere chambers and others whose nature cannot be disclosed because of the war. (*See* also PUBLIC HEALTH ENGINEERING.) (F. H. F.)

Air Forces of the World.

U.S. Navy.—During the first eight months of 1942, the activities of the bureau of aeronautics continued under the direction of Rear Admiral John H. Towers, U.S.N. He was detached in September to take over the duties of commander, U.S. naval air forces, Pacific, with the rank of vice-admiral. At that time, Rear Admiral John S. McCain, U.S.N., relieved him as chief of the bureau of aeronautics.

The United States' first offensive action was the raid by U.S. navy carrier-based aeroplanes on the Marshall and Gilbert islands on Feb. 1. This raid was an outstanding success.

Later in February a Japanese force attacked one of the U.S. carriers off Bougainville in the southwestern Pacific. U.S. fighter pilots shot down 16 out of the 18 Japanese bombers that attacked.

The Marshall and Gilbert successes were repeated, first at enemy-held Wake island, then at Marcus island. Damage to enemy shore installations on these raids must have taken months to repair. Then came the action at Salamaua and Lae on New Guinea. Carrier-based dive bombers, fighters and torpedoplanes roared over a mountain pass and dropped down on a large Japanese force. These aeroplanes sank 2 Japanese heavy cruisers, 1 light cruiser, 1 destroyer and 5 transport and cargo ships. Two other destroyers and 4 other enemy vessels were damaged. U.S. losses were 1 dive bomber.

The pattern of this attack was repeated at enemy-held Tulagi on May 4. One light cruiser, 2 destroyers, 1 cargo ship and 4 gunboats were sunk. Five Japanese seaplanes were shot down. It cost the United States 2 fighters and 1 torpedoplane.

In the battle of the Coral sea on May 7 and 8, carrier-based aeroplanes intercepted a Japanese force which was advancing on Port Moresby. A Japanese carrier and cruiser were sunk. Two other carriers were badly damaged and 91 enemy aeroplanes were shot down. The United States lost the "Lexington," but saved many of its aeroplanes. Twenty-seven U.S. planes were lost in combat.

At Midway, in June, another carrier was lost, the "Yorktown." The Japs lost 2 cruisers, 3 destroyers and 4 carriers, the "Kaga," "Akagi," "Soryu" and "Hiryu." Of later actions in the Aleutians and the Solomons, as in the Atlantic, little could be revealed.

It should be emphasized that the successes of naval aviation to date (Jan 1, 1943) were accomplished with types of aeroplanes which were already in active service at the beginning of the war. Principally, these were the Grumman Wildcat fighter, the Douglas Dauntless scout bomber, and the Douglas Devastator torpedo bomber. Great as was the performance of these aeroplanes, highly improved performance was expected from the new types which were going into service. These types represented years of the most painstaking development in airframe design, engines, armour and fire power. They included outstanding aeroplanes in every combat type—dive bombers, fighters, torpedoplanes and long-range patrol bombers. (J. S. M.)

U.S. Army.—The year 1942 brought the first great battle test of the army air forces. From some 200,000 at the first of the year, the total of 1,000,000 officers and men was passed before the end of 1942, with a goal of 2,200,000 for 1943. Congress made funds available for the army air forces as follows:

Fiscal year ended June 30, 1940	$ 243,631,388
Fiscal year ended June 30, 1941	3,892,769,570
Fiscal year ended June 30, 1942	21,952,516,861

A few weeks before the turn of the year, the war department announced that the 54-group program which had been put into effect in June 1941 when the army air forces were given a distinctive status, was to be augmented to an 84-group program and a goal of some 650,000 officers and men. With the entrance of the United States into the global conflict, plans for greatly increasing the training programs for air and ground crews were put into effect, and orders placed for tens of thousands of military aeroplanes of all types. The heavy bomber emerged as the primary long range offensive weapon and the program to turn out large numbers of improved versions of current models, in pooled production, was greatly increased.

In the main theatres of combat, adequate bases for air operations were established, including Great Britain, Africa, Asia and the southwest Pacific. An overseas division of the air service command was established and facilities for maintenance of aircraft and equipment greatly improved. The air corps ferrying command, established in May 1941 for ferrying lend-lease aeroplanes from the factories to delivery points for England, was greatly expanded as the air transport command. Four great air routes were pioneered, and a world-wide air service was in operation which carried aeroplanes, supplies, personnel and mail to all the fighting fronts.

To meet the demands of modern, fast moving, all-out warfare, the war department announced a drastic, streamlining army reorganization in March 1942. The U.S. army was divided into three main parts: The ground forces (including the infantry, artillery, cavalry, armoured force, etc.); the services of supply (which included the organizations for supply, maintenance and administration, such as the quartermaster corps, signal corps, ordnance, etc.); and the air forces. Thus the air forces were, for the first time, placed on an equal basis with all the other combat branches of the army combined.

The U.S. army air forces, as the name implies, are a group of powerful, self-contained, air striking forces. Four of these in 1942 covered the continental United States. Others provided for the defense of such vital areas as the Canal Zone, Alaska and Hawaii. Still others were overseas, operating from bases in England, Africa, the middle east, India, China, New Guinea, the Solomons, Australia and elsewhere. At the close of 1942, the U.S. army air forces were operating on a larger number of fronts than any other organized military force in the world. (H. H. A.)

The World.[1]—During 1942, the first year of an all-out world-wide air war, few new or novel military aircraft came into active use. Although newspapers and magazines were full of talk of "secret" weapons or of super aerial battleships, actually no aircraft appeared over any front during the calendar year 1942 that looked much different from the fighting machines of 1941 or 1940. There was considerable improvement. Designers and builders everywhere were constantly changing details in an effort to satisfy the constantly changing needs of the tactical groups, but so far, no radical departure from the conventional appeared to give its possessor unquestioned superiority in the air.

Germany declared war in 1939 only after she had built up an air fleet large enough (as she thought) to guarantee success by the blitzkrieg method. The tactical squadrons in the field were backed up by a production of standardized types sufficient to take care of the necessary replacements for a supposedly short war. Research and development were not entirely neglected, but became secondary to production. Only after it became evident that the war was not to be won in 1940 or 1941 was great stress put on retooling the German aircraft industry for the production of machines that had been laid down on drafting boards, or tested in laboratories after the war started.

---

[1] All assertions or opinions contained in this section of this article are the private ones of the writer and are not to be construed as official or reflecting the views of any organization or government service.

The same situation obtained in Britain. When war came, Britain had far fewer aircraft in the field than she needed. Further, the destructive raids of 1940, together with the terrific attrition of the Dunkirk period, compelled her to concentrate all her efforts on the production of types that had been designed and developed during the years immediately prior to the war. Only after the relief afforded by the rehabilitation of her own factories, and by the operation of lend-lease, was Britain able to divert engineering talent into the development of aircraft designed to outfly the faster and more powerful ships that soon were flowing from Germany's revamped factories.

In wartime, actual figures on production rates are carefully guarded military secrets. Many guesses were current, based on estimated floor space in factories, and the availability of manpower. It was difficult, however, to apply proper discounts for interruptions due to bombings by the enemy, or occasioned by shortages of essential raw materials. It was generally believed, however, that by the end of 1942, the United Nations had succeeded in passing the output of both planes and engines established by the axis powers.

The numerical strength of the combatant forces was also difficult of estimation. It could not be gauged by the simple process of subtracting announced losses from estimated production. The latter figures were sketchy, at best, and the former were generally falsified, whether from enemy or friendly source. Further, the losses reported were only those due to enemy action. It was well known that the major attrition of matériel came about more from operational accidents (either in training, or in the process of leaving for or returning from combat missions) and from losses in bad weather, than from combat.

Trends in enemy aircraft design could only be guessed until actual examples of new types fell into allied hands. Every aeroplane shot down on home territory was immediately examined in great detail by engineers and technicians. Analyses of materials, fuels and oils give valuable clues to the state of the resources of the enemy. The forced landing of an undamaged Focke-Wulf FW-190 in England, and the recovery of an almost intact Japanese Zero in Alaska proved invaluable to the air force people. Also, every combat aeroplane is fitted with automatic cameras which bring back pictures of enemy aeroplanes encountered.

THE AXIS POWERS

Japan.—Before Dec. 7, 1941, little real information on Japanese air strength was available. Over a period of years Germany, France, Italy and the United States had sold the Japanese government or the Japanese airlines a number of military and commercial designs, presumably obsolete. It was known that these basic types had been studied and copied, but there was little outside evidence that they had been greatly improved upon, or that they had been reproduced in any appreciable quantities.

No accurate figures were ever tabulated on the extent of the Japanese aircraft industry, or of its output. Putting together information from German, Italian and American sources, there were at least 17 major aircraft manufacturing plants in Japan proper. It was estimated that the capacity of these factories was between 500 to 1,000 units a month. Largest and best known was the Mitsubishi factory at Nagoya. In 1939 it was reported to be employing some 6,000 people, a figure that was undoubtedly doubled or trebled. Other important manufacturers included the Nakajima factory at Gumma-ken, the Kawasaki and the Kawanishi concerns at Kobe, the Nichii Koku Kogyo K.K. at Kyoto (owned jointly by Japanese and Italian interests), the Aichi factory at Nagoya, the Aiba and the Hitashi companies in Tokyo, the Nippon Hikoki K.K. in Yokohama, and the Nippon Koku Kogyo K.K. at Hiratsuka. Thousands of small shops and individual workers in scattered villages were said to be making aircraft components to feed the principal production lines.

During the four or five years prior to the outbreak of the war, Japan acquired a large number of licenses to manufacture European aircraft and accessories, including Italian Fiat bombers, German Heinkel and Junkers bombers, and the German Messerschmitt Me-109 and Me-110 fighters. Reports indicated that the latest German fighter designs, including the FW-190 and the Me-210 were released to the Japanese. It was known that Japanese concerns took licenses to build the Swiss Oerlikon and the French Hispano aircraft cannons. It may be noted also that many of the Japanese bombers and fighters that were shot down were fitted with propellers built under license from U.S. manufacturers.

Fewer details were available regarding Japanese engine design and construction, but their power plants followed closely trends of design elsewhere in the world. At least ten plants were engaged in the manufacture of engines. There were very few liquid-cooled engines in service in Japanese aeroplanes. Most combat types appeared to be powered with twin-row radial air-cooled engines. One of the few such engines that was captured intact was analyzed carefully by U.S. engineers. Examination disclosed that there was no evidence of shortage of special alloys or materials essential to manufacture engines. An excerpt from their findings is significant, ". . . that the group responsible for the design did a very ingenious job of combining . . . the most desirable features of a number of products of foreign manufacture . . . a highly dependable, even though not highly developed piece of equipment . . . probably produced under time and tooling limitations which we would consider nearly impossible."

The Japanese had a system of designating their aircraft models which tied them directly to the year of manufacture. The two digits which follow the name of any Japanese aeroplane indicate the year in which it was made, not in terms of the Christian calendar, but referred to their own. Thus 00 indicates the year 2600 of the Japanese empire which corresponds to 1940, and 01 and 02 mean 1941 and 1942. There were still a few of the 97, 98, and 99 models in service, but reports indicated a preponderance of equipment built subsequent to 1940.

Best known in 1942 was the Mitsubishi 00, or Zero fighter. It was a single seater of small dimension but of conventional pattern. The Zero had a span of 39 ft. 5 in. It was 30 ft. 3 in. in overall length. It was a low wing monoplane with retractable landing gear. Its wings folded for stowage on board aircraft carriers. Its cockpit, designed for the average Japanese pilot was too small for comfort for the average American fighter pilot. The engine was a 14-cylinder twin-row radial air-cooled type of an estimated 900 to 1,000 h.p. The propeller was a hydraulic constant speed type of American design. In its original concept, everything was sacrificed for structural lightness which resulted in high rate of climb and great manoeuvrability. These characteristics proved troublesome to U.S. pilots in more heavily armed and armoured aircraft. Significantly, the Mitsubishi 01 and 02 are considerably heavier than the original, because some of the things that were left out in the beginning were later added, such as body armour for the pilots, protection for fuel tanks, and increased structural strength. In the long run, the original Zeros proved to be too vulnerable to attack and too frail to stay together in violent combat manoeuvres or under the impact of gunfire.

One of the latest machines was captured, and was in the United States under intensive evaluation. This particular plane weighed approximately 5,200 lb. in fighting condition, including 60 rounds of ammunition each for its two 20-mm. cannon, and 500 rounds total for two 7.7 machine guns. This weight contrasts with the average 7,000 to 9,000 lb. all-up for current U.S. and British fighters. Tests showed that the Zero is an excellent aeroplane, but has no "super" characteristics that cannot be matched by U.S. fighters.

Other recent fighters include the Nakajima S-01 fitted with a Mitsubishi engine of 1,050 h.p. and said to have a top speed of 387 m.p.h. The Kawasaki S-01 is fitted with the same engine, flies at 375 m.p.h. A more recent type that parallels the German Me-110 or the Lockheed P-38, is the Mitsubishi S-02. This aeroplane is a single seater fitted with two 1,000-h.p. engines. Its armament (at least one cannon and several machine guns) is mounted in the nose ahead of the pilot. It is designed with a tricycle type undercarriage. It is reported to have a top speed of 350 m.p.h. and a service ceiling of 31,000 ft.

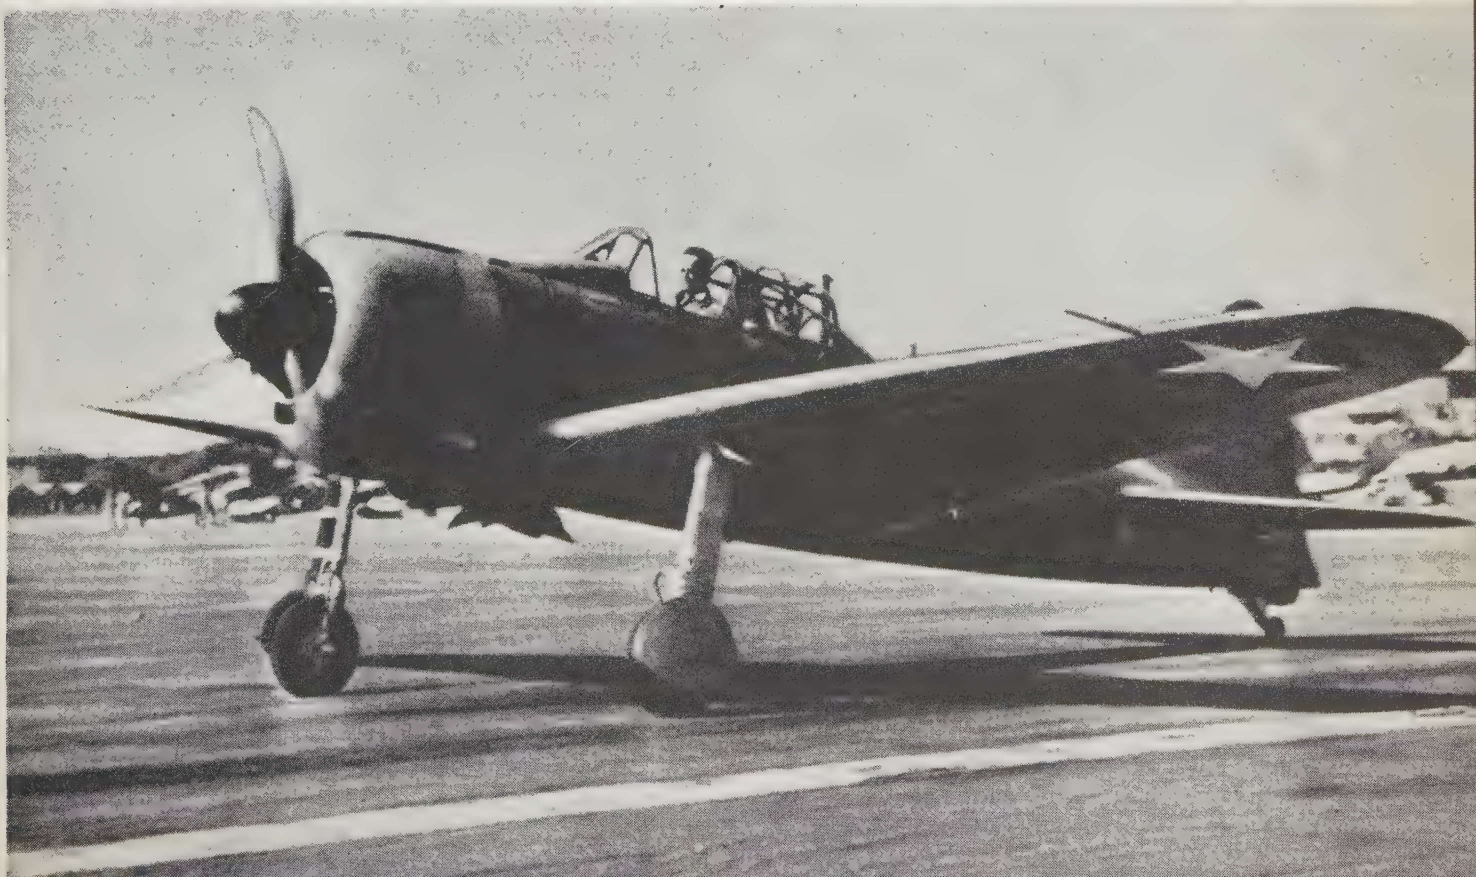
Although few examples were acquired intact, the Japanese forces had several fast and efficient dive bombers and torpedo carriers. It was undoubtedly ships of this type that wrought such havoc at Pearl Harbor and which accounted for the destruction of several U.S. vessels. Photographs taken in action indicated that these ships were generally single-engine low wing monoplanes, most of them two seaters of thoroughly modern design and with performance up to first rate dive bomber standards anywhere. The Nakajima K-01, with a 950-h.p. engine was typical of this class.

Both the Japanese army and navy conducted extensive raids at relatively long ranges (in the Philippines and in the southwest Pacific areas) with twin-engine medium bombers that appeared to be relatively fast, well armed and efficient. These machines showed strong German influence, the older Mitsubishi Soyakaze 96 following closely the Junkers pattern, and the Nakajima Naka 19 showing marked traces of Heinkel. A more recent example appeared to be of strictly Japanese origin—the Mitsubishi OB-01. This heavy navy bomber and torpedoplane was designed to work from aircraft carriers. It was powered by two air-cooled radial engines. It could carry one or two torpedoes or heavy bombs. It was well protected with guns fore and aft.

No evidence was uncovered of the use of four-engine land bombers comparable to U.S. Flying Fortresses or Liberators. The Japanese were in possession of at least one U.S. four-engine prototype, the original Douglas DC-4, and have also taken a license to build the German Focke-Wulf 200. There was no reason to believe they are incapable of designing and building adequate four-engine bombers on their own. The only four-engine type reported is a large flying boat which was obviously used as a long range patrol bomber and transport. This machine bore a strong resemblance to the Sikorsky S-42 or the French Latecoere flying boats.

Germany.—A number of new and improved aeroplanes were introduced into luftwaffe squadrons during 1942, none of particularly startling design. Performance and armament were improved, and changes were introduced to meet certain specific combat conditions, but all aircraft were of a conventional nature.

There was one exception, the Blohm and Voss BV-144, a non-symmetrical observation aeroplane that has a curious appearance in flight but possesses questionable advantages. In an effort to obtain wider-than-average vision and field of fire, the main fuselage has been offset to the left of the centre line of the wing and a short nacelle for pilot and observer-gunner occupies a corresponding position to the right. The fuselage carries a single BMW 801 engine of 1,600 h.p. in the nose. Rudder and stabilizer are in the usual locations, but the stabilizer is extremely offset to the left of the fuselage. The nacelle is covered largely with a transparent plastic material so that both occupants have an al-



THE FAMED "ZERO," Japanese fighting plane with high climbing speed and manoeuvrability but no armour to protect the pilot. The plane pictured with the U.S. star was captured by U.S. forces in the Aleutian islands in June 1942 most unlimited view ahead, above and behind. The fuselage portion is of small cross section so that the obstruction of view to the left is comparatively small. The concept is not entirely new. An American aeroplane designer took out patents on a very similar idea almost 15 years ago, but U.S. military people never saw enough advantage in the design to place any orders for such machines.

In the fighter group, the well tried Me-109 was still in active service. Most of those that appeared in combat during the year were the Model F's, a generally cleaned up version of the original 109. Engine power was increased, and the armament and armour was generally stripped down to make the aeroplane lighter for faster climb and better performance at high altitudes. One 20-mm. cannon fired through the propeller hub and two .310 machine guns were fitted in the fuselage with synchronizer gear to fire through the propeller. Top speed was a little better than 370 m.p.h. at 22,000 ft.

The Me-209 was a development from the 109, but an entirely new aeroplane. It was a single seater fitted with the 1,450-h.p. DB-603 liquid-cooled engine. It carried six or eight machine guns or various combinations of cannon and machine guns. It was reported to have a top speed of 398 m.p.h. at 21,000 ft., and a service ceiling of 42,000 ft.

The twin-engine destroyer fighter type of which the Me-110 was the outstanding example was continued in a further development, the Me-210. This aeroplane was bigger and heavier than its predecessor. Where the Me-110 had two DB-601 engines of 1,150 h.p. each, the 210 had two DB-603's at 1,450 h.p. each. Major armament was carried in the nose and consisted of two cannon and four fixed machine guns. There was one flexible gun aft for the second crew member. Provision was made for the carriage of bombs externally. Speed was said to be 365 m.p.h. at 16,400 ft.

Most widely advertised German fighter of the year was the Focke-Wulf FW-190 introduced in quantity during the summer to combat the high flying American Fortresses. Most interesting feature was the use of the radial air-cooled engine, a marked departure from previous German fighter practice which has relied almost entirely on the liquid-cooled power plant. The BMW-801D 14-cylinder twin-row radial engine was reported to develop 1,600 h.p. for take-off, and 1,750 h.p. at 18,000 ft. A great deal of research evidently went into the cowling of this engine, for it apparently cools properly at all altitudes. An engine-driven fan in the nose provides for cooling at high rates of climb.

The FW-190 might well mark a new trend because a number of high performance fighters both in the United States and elsewhere were swinging over to the radial air-cooled engine (the Republic P-47 is a good example).

The FW-190 was of unusually well integrated design. It was not only an excellent fighting machine, but was carefully studied for simplified quantity production with extensive subcontracting of its components. It was small, 34 ft. 5 in. span, 29 ft. 4 in. long. The installations were simple and accessible. The pilot was well protected by armour, and the armament consisted of four 20-mm. cannon in the wings and two 7.92-mm. machine guns in the fuselage firing through the propeller.

One other type of fighter appeared frequently in 1942, the Focke-Wulf FW-189. This was a twin-engine two-place type somewhat similar to the Lockheed P-38 Lightning with tail surfaces carried on twin fuselages and with the crew housed in a central nacelle, largely glass enclosed. This type was first introduced in Europe by Fokker about 1936.

In the bomber class, medium size dive and level bombers predominated. The old Junkers 87B, the Stuka, still turned up in quantities in tight places where ground targets were to be attacked. This aeroplane was powered with a single 1,000-h.p. Jumo 211 engine. Its top speed was about 240 m.p.h. and it carried one 1,100-lb. bomb and two machine guns.

More modern are the Ju-88A and Ju-88B four-place level bombers. Latest types had two 1,200-h.p. Jumo 211D engines. They were liquid-cooled, mounted in circular nacelles with circular radiators which gave the typical appearance of the air-cooled installation. With a battery of cannon and machine guns in the nose in place of bombs, the Ju-88 became an efficient night fighter. Its top speed was about 320 m.p.h.

The 1942 version of the old Dornier "Flying Pencil" was the Do-217E. It was introduced around the first of the year, powered with two DB-801 radial air-cooled engines. Later models carried two 2,000-h.p. BMW 802 engines. An interesting feature was the installation of auxiliary fan cooling for these larger engines, to permit high rates of climb at high power. The machine also was fitted with exhaust-heated wings for de-icing. It carried one 20-mm., one 15-mm. cannon and seven machine guns. Its reported bomb load was over 6,000 lb. for a range of 1,500 mi. Speed was 310 to 325 m.p.h. at 18,000 ft. Provisions were installed for assisted take-off and for glider towing. A novel feature was a parachute arrangement at the tail to act as a dive brake. Conventional dive brakes are usually fitted as auxiliary flaps on the wings. Aside from structural difficulties which such flaps impose, they sometimes make the aeroplane unstable in a dive and reduce accuracy of the bomber's aim. The new Dornier tail brakes unfold like four petals of a flower from an extended tail cone. The braking load is thus absorbed in the fuselage of the machine. It seemed likely that directional stability in a dive would be improved. This form of brake was one of the few design novelties of the year.

In 1942, the Germans were not nearly as prolific as the British in the matter of four-engine bombers. The Focke-Wulf 200 Kurier continued to patrol the North Atlantic in search of convoys. This machine had an all-up weight of 38,000 lb., carried a crew of six and was powered with four 1,000-h.p. Fafnir radial air-cooled engines.

Once or twice, very large bombers were reported over England at extremely high altitudes. There was some reason to believe that these machines might have been powered with newly developed diesel engines and were probably of the pressurized cabin type. It was known that a modernized version of the old Ju-86 fitted with Jumo 207 diesels bombed British towns from above 40,000 ft. altitude.

The only new bomber that was definitely identified and described in any detail was the Heinkel 177. It first appeared in a daylight raid over England toward the end of Aug. 1942. It resembled a twin-engine machine, but it was known to have four engines, each pair driving a single propeller. The engines were presumably liquid-cooled of at least 1,000 h.p. each. This was the first example known of a service type in which two engines were geared to a common propeller. The Heinkel 177 had a wing span of well over 100 ft. It had a top speed of around 280 m.p.h., and a probable cruising range of 7,000 mi. at an average cruising speed of 180 m.p.h. Its actual weight and bomb carrying capacity were not accurately known.

Another large bomber, a military version of a transatlantic prototype that was designed before the war, was the Blohm and Voss 222 with six 1,000-h.p. BMW 132 engines. It was thought to have an all-up weight of around 100,000 lb. with a top speed of about 200 m.p.h. at 10,000 ft. Its cruising range was thought to be 4,400 mi. at a speed of 170 m.p.h. average.

The only actual mention of new diesel-powered aeroplanes in Germany (apart from speculation about high flying bombers) was in the three-engine Blohm and Voss HA-138B. This was a

three-engine flying boat presumably being used as a replacement to the Dornier flying boats which were active during the early phases of the war in the bombing of Scapa Flow and in the laying of the so-called magnetic mines in British coastal waters.

During 1942, a number of German troop-carrying gliders were picked up by the British, mainly in the North Africa theatre. The gliders which were first used in the capture of Crete were conventional types, high-wing monoplane, single large fuselage and normal tail surface. In the summer of 1942 an improved type, the Gotha 242's were used. Each could accommodate 20 fully equipped troopers. These machines had a wing span of 79 ft., a length of 52 ft. The tail surfaces were carried on light twin booms and cargo and crew were housed in a large central nacelle. Major advantage, apart from possible structural weight saving, was the ability to load and unload quickly through large hinged covers in both the nose and the stern of the nacelle. It may be noted in passing that the use of gliders was confined mainly to the moving of troops into tactical areas. Contrary to popular notion, there appeared to be very little movement of cargo in glider "trains." The economics of cargo carrying by glider train was still doubtful, and reports indicated that the supplying of Rommel's Afrika Korps across the Mediterranean was carried out almost exclusively by means of the old Ju-52 three-engine transports. One report mentioned a large glider with a wing span of 275 ft. designed to carry a heavy tank. This monster was said to be towed behind three Focke-Wulf four-engined Condors. Confirmation was lacking and the practicability if not the authenticity of such a project might well be questioned.

The exact status of German aircraft production during 1942 was obscure. The production pause that was evident late in 1941, occasioned by the retooling of the German aircraft industry for new and improved types was probably nearing an end late in 1942. Little was known about the conditions of stock piles of essential materials, but there was no indication, from the examination of captured matériel, that acute shortages existed in any of the essential metals. The absorption of French industry and the industrial areas of Central Europe undoubtedly released sufficient stocks of basic raw materials to permit production of aircraft at reasonably high rates for a long time to come. There was no doubt but that Germany put French and Italian factories to work on the production of German types.

Italy.—Of all the axis powers, Italy made the least contribution to the total air strength during 1942. Italian fighter squadrons made a poor showing in the North Africa campaign. One or two relatively new fighters put in an appearance during the year, but most of the aircraft that were brought down or captured were of obsolete type. The Macchi C-202 represented current Italian design. It was a single-seater with the pilot well back toward the tail. It bore a strong resemblance to the later Messerschmitt 109 and was powered with an Italian-built DB 601 engine. The nose treatment was excellent, the propeller being fitted with an unusually large well faired spinner.

In the bomber field, the three-engine type which characterized Italian heavy bombardment practice was still in evidence. The newest Capronis and Savoia-Marchettis were of this type. Typical example was the SM-84 bomber. It was fitted with three 1,000-h.p. Piaggio 14-cylinder radial air-cooled engines. Engines were equipped with elaborate air filter systems to keep out sand in desert operations. Its gross weight was 27,700 lb. Top speed was reported at 295 m.p.h. As with most large Italian machines it was of mixed construction—wooden wings with steel tube, fabric-covered fuselage. For one reason or another, however, Italian bombardment aviation played relatively little part in the major theatres of war. Its main job seemed to have been the maintenance of a continuous bombardment against the British-held island of Malta. For this type of operation bombers mounted on seaplane floats were frequently used. Such machines functioned also as torpedo carriers. One of Italy's newest was the Caproni 312, a fairly fast twin-engine float seaplane.

The one aerodynamic novelty that appeared early in 1942 was of Italian origin, the jet-propelled Caproni-Campini CC-22. This machine had no military significance as it was a purely experimental type, but it forecast a type of propulsion that might be of considerable importance in high-speed high-altitude combat. In place of the usual engine-driven propeller, the aircraft was driven by means of an internal blower which sucked air in at the nose of the fuselage and blew it out through a tube in the stern. The blower action was augmented by the introduction of burning gasoline in a combustion chamber at the rear. The column of hot gases expelled astern propelled the whole machine as a skyrocket is driven by its jet of burning gas.

Italian production during the year appeared to have been at a relatively low level. During the early part of 1942 there were evidences of shortage of manpower and materials. There were indications also that a number of factories were going through a retooling phase. The frequent visitations of British heavy bombers apparently crippled many Italian industries. Most aircraft factories are in the northern portions, mainly in the vicinity of Turin and Milan. These cities were blasted time after time and undoubtedly the aircraft plants suffered heavily.

THE ALLIES

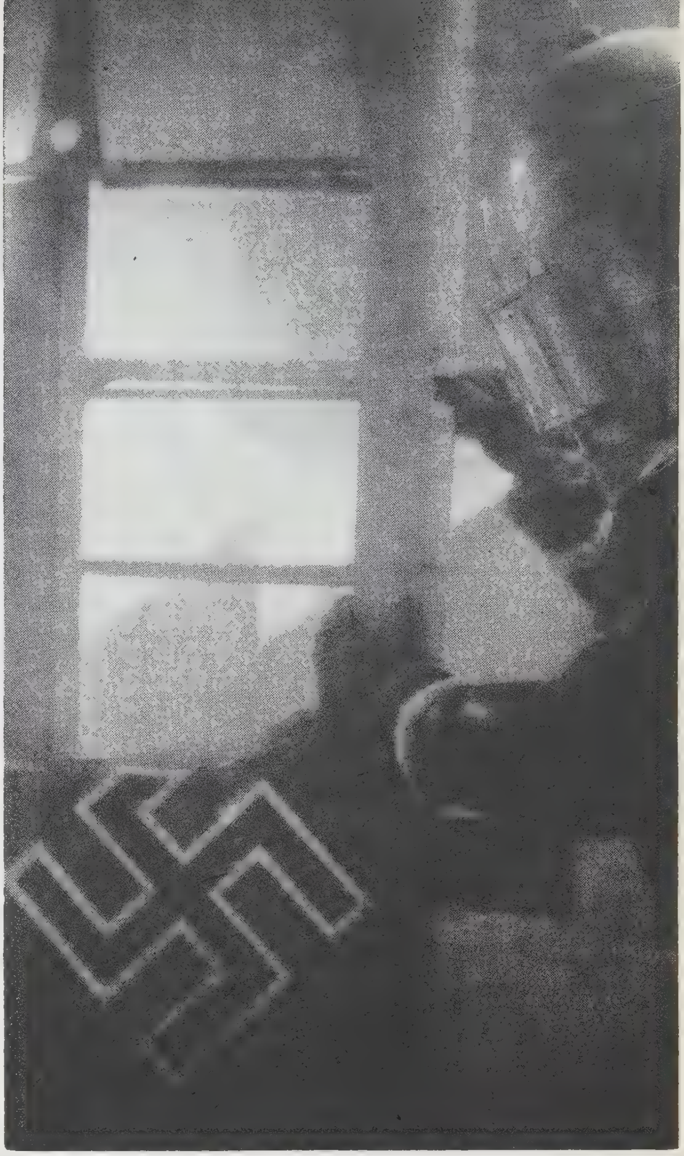
The fighting aircraft of the United Nations went through the same progressive improvement that characterized axis aircraft of 1942. Few new aircraft names appeared in 1942's records. British fighter pilots were still doing their work on Spitfires and Hurricanes, on Tomahawks and Kittyhawks. U.S. pilots in Europe flew Warhawks, Lightnings, Liberators and Flying Fortresses.

Great Britain.—British aircraft manufacturing got back into its stride. Most of the damage to aircraft factories had long since been repaired. Factories were more and more decentralized to minimize bomb damage, and in several cases whole factories were moved underground. One plant, for example, was installed in the galleries of a mine many feet below the surface of the earth. Another occupied a three-mile stretch of a former subway. The production machines were strung out the length of the "tube" and incoming materials and the outflow of product were handled on trucks on the old track.

In 1942 the R.A.F. not only had ample matériel resources to protect the British Isles and to conduct active campaigns in Africa, but also to dispatch large numbers of extremely heavy air raiders over France, Germany and northern Italy. The raids on Cologne, Rostock and the northern Italian cities far and away exceeded the worst that the Germans had done in England.

Outstanding in the R.A.F. in 1942 was the widespread use of the big four-engine bomber. Before the war, many British experts had been openly sceptical of the big four-engine bomber—a distinctly American development. It was argued that its size and lack of manoeuvrability would make it an easy target for interceptors. The British found, however, that the giant bomber, when used at night, could carry tremendous bomb loads at reasonable ranges. The two- and four-ton "block buster" bombs were carried over their targets in four-engine machines. Newest of the type was the Avro Lancaster which could handle a mighty bomb load for 1,000 mi. at close to 300 m.p.h. Its gross weight was 63,000 lb., its wing span, 103 ft. For protection it carried ten heavy machine guns mounted in power turrets. The four Rolls-Royce Merlin XX's are rated at 1,200 h.p. each at 12,000 ft. The Lancaster was engineered for ease of production.

The Short Stirling figured in many of 1942's heavy raids. It grossed 65,000 lb., had a wing spread of 99 ft. The four engines were Bristol 14-cylinder Hercules sleeve valve type. Its performance was much the same as that of the Lancaster. Eight guns were mounted in three turrets.



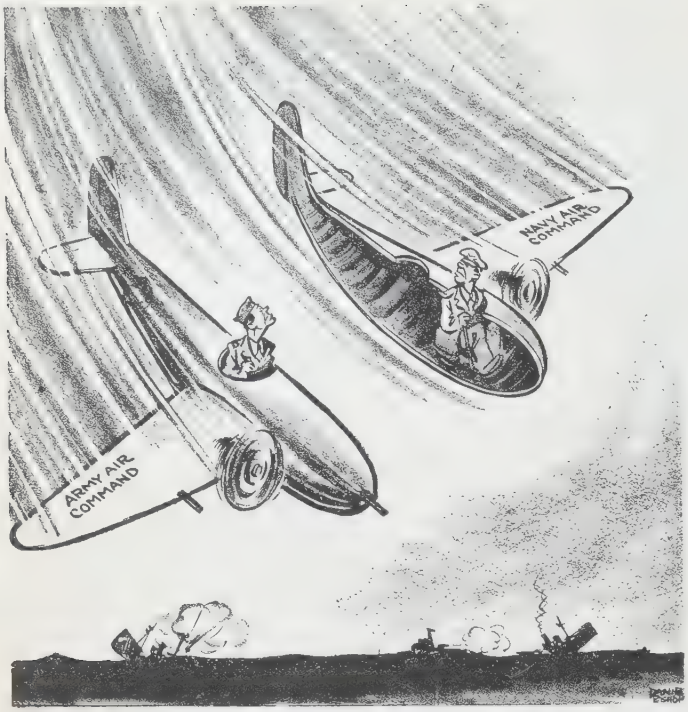
ENGINEER of the Douglas Aircraft company studying the effect of intense cold on the tail section of a German Messerschmitt 110 shot down over England and sent to the U.S. for research in 1942

Older than either Stirling or Lancaster was the Handley Page Halifax with four Rolls-Royce liquid-cooled engines. Squadrons of these three heavy bombers wrought untold destruction to the axis-held cities of Europe during 1942.

Another bomber, almost as big, but with two engines, was the Avro Manchester. It had almost as much power as the four-engined bombers. It was fitted with two X type 24-cylinder Rolls-Royce Vulture engines of 2,000 h.p. each. It was reported as participating in many raids in 1942.

In the medium bomber and night fighter field (twin-engine high speed machines) the Bristol Beaufort, the Bristol Blenheim IV and the Bristol Beaufighter were on active service. Large numbers of American-built Douglas Bostons (A-20's) and Martin Baltimores came into use during 1942. The Boston had a night-fighter counterpart, the Havoc, in which the bomb load was replaced by a heavy gun battery in the nose.

Most interesting of the new British bombers was the De Havilland Mosquito, a machine whose prototype was several years old, but which was kept very much on the secret list until late in 1942. The Mosquito was a twin-engine (two Rolls-Royce Merlins) built almost entirely of plywood and plastic. It had a 54-ft.



"GET TOGETHER, BOYS," warned Bishop of the *St. Louis Star-Times* as he criticized the divided command of U.S. army and navy air forces in 1942

wing span and was 41 ft. long. Little was known of its load carrying capacity or performance except that it was said to be faster than the FW-190 at low altitudes. It was distinctly in the medium class, carrying a heavy load of bombs at high speed. It may be fitted out as a fighter with 20-mm. cannon and .303 machine guns. It was reported first in active service on a raid over Gestapo headquarters in Oslo, a 1,000-mi. round trip from England. It was announced that a large number of this type would be built in Canada.

The Vickers Supermarine Spitfire, in its latest form was still considered the best all-round fighter aeroplane in the world. The type is not new (it was first introduced at the R.A.F. display in the spring of 1936) but it went through a process of continual refinement that kept its performance well up to date. Spitfires were in service with a wide variation of armament with from two to four 20-mm. cannon and up to eight or ten wing-mounted machine guns.

The Hawker Hurricane, slightly older and with somewhat less performance than the Spitfire, was still the Number Two fighter of the R.A.F. Its armament showed the same sort of variation as did the Spitfire. Hurricane fighters stripped of their landing gear were used as catapult-launched protection for merchant ships. A number of these machines were fitted on ships in large convoys, to be catapulted into the air on the appearance of enemy bombers. Once their mission was completed, the pilots had only the choice of trying to reach land (if within range) or landing in the sea alongside the ships. In the latter case, the pilots had a chance of rescue, but the aircraft was not recoverable. The appearance of Hurricane fighters over convoys far out at sea must have been a considerable surprise to German long-range bomber pilots who undoubtedly thought themselves safe from air attack.

A new type of fighter that appeared in 1942 in limited numbers was the Westland Whirlwind, a single-seater powered with two wing-mounted 885-h.p. Rolls-Royce liquid-cooled engines. Its top speed was better than 350 m.p.h. and it carried a battery of four 20-mm. cannon in the nose just ahead of the pilot. This heavy armament made it a formidable adversary for the German Me-110 or the later Me-210 of comparable type.

The British, with an eye to the eventual invasion of nazi-held Europe, also were doing considerable training and experimenting with troop-carrying gliders. Several large machines (Hotspur I and Hotspur II) were in production. They accommodate eight or ten troopers. Wheeled undercarriages were provided for take-off but might be dropped in flight. Belly skids provided for landings. Structure was largely plywood.

A large number of American-built aircraft furnished under lend-lease agreements were on duty with the R.A.F. and the fleet air arm in various parts of the world. The list included:

Fighters:—Bell Airacobra, Curtiss Tomahawk, Curtiss Kittyhawk, Curtiss Mohawk, Grumman Martlet, Lockheed Lightning, North American Mustang, Republic Thunderbolt.
Bombers:—Boeing Fortress, Consolidated Liberator, Douglas Boston, Martin Maryland, Martin Baltimore, Martin Marauder, North American Mitchell.
Dive Bombers:—Brewster Bermuda, Vought-Sikorsky Chesapeake, Vultee Vengeance.
Reconnaissance:—Lockheed Hudson, Lockheed Ventura.
Co-operation:—Fairchild Argus, Vultee Vigilant.
Trainers:—North American Harvard, Vought-Sikorsky Kingfisher.
Patrol:—Consolidated Catalina (flying boat).

Russia.—Although at few times during the campaigns of 1942 could it be said that soviet aviation completely dominated the air over the fighting fronts, Russian aeroplanes and airmen played a highly important part in stemming the German tide before Leningrad and Stalingrad. The combined use of air and ground armies proved extremely effective. It was characteristic of the soviet air arm from its inception that it was considered an integrated weapon of the Red army's arsenal. Co-operation with ground troops was its major mission. It was not without reason that the most intensive development work with paratroops and air-borne infantry was done in the U.S.S.R. during the years prior to the war.

In 1941 comparatively little was known of the trends of Russian design. The best that could be done was to project ahead the basic types that had been in use in Spain in the late 1930s. Thanks partly to German sources, a picture began to emerge of thoroughly modern equipment. Because of the great language and alphabetical difficulties, the Russian type and model designations were frequently confusing to English readers. Most of the letters stand simply for the name of the designers, thus, YAK for Yakovlev, IL for Ilyuskin, etc.

Liquid-cooled power plants seemed to predominate in the newest aircraft of all classes. The M-38 engine, a 12-cylinder Vee-type of about 1,300 h.p., was widely used, singly in the fighters, in pairs or in fours in the bombers.

The Stormovik (IL-2) figured prominently in the news of smashing German tank and mechanized columns. This was a single-engine (liquid-cooled) single-seat dive bomber, fitted with two 20-mm. cannon and four heavy machine guns for low altitude ground attack. It was heavily armoured. Two other larger machines, the YAK-4 and the PE-2, served for similar missions as well as for high-speed level bombing with moderately heavy loads. They varied in detail, but were of basically similar design. Each carried a crew of two. Each was provided with two liquid-cooled engines.

In the medium bomber class, the older SB-3 and DB-3 machines were still in service, although continual improvement was in evidence. Both were three- or four-place bombers of moderately good performance. The SB class was fitted with M-103 engines (a 12-cylinder liquid-cooled Vee-type based on the French Hispano-Suiza). The DB's carried M-88 14-cylinder radial air-cooled engines, a development of the French Gnome-Rhone K-14.

Russians were always fond of huge bombers. The giant ANT's with four, six, or eight engines, frequently reported over Red square on May Days, were not much in evidence over enemy cities. Possibly they were found too vulnerable to attack. One of the few bits of direct evidence of the existence of big four-engine bombers was the appearance in England, and later in the

U.S., of the TB-7 that ferried Commissar of Foreign Affairs Molotov to his conferences with Churchill and Roosevelt. It was a four-engine monoplane with a wing span in the neighbourhood of 120 ft. Its engines were probably the M-38 type. Of interest was the treatment of the two inboard nacelles. They extended far enough below the wing to house radiators for both engines on each side, the retracting landing gear, and a gun turret for rear protection.

Russian fighter designs did not appear to be particularly inspired. The old stub-nosed single seaters of Spanish war vintage (based on the Boeing P-26) long since gave place to a new series of fighters of the Spitfire, Me-109, Curtiss' P-40 pattern. The I-18, for example, resembled the Spitfire. It was provided with a 1,250-h.p. liquid-cooled engine, carried six machine guns and one 20-mm. cannon. Speed was in the 350 to 400 m.p.h. range. A late model, the YAK-1 (I-26) appeared to be in high production. Its U.S. counterpart was the P-40. A newer variation on the fighter theme, the MIG-3 (I-61), was also being turned out in quantity. It was characterized by an inverted gull-wing, somewhat similar to the Vought-Sikorsky F4U shipboard fighter.

One other aeroplane of note was mentioned in German reports —the SU-2 dive bomber and observation type. This was a two-seater, pilot in front with gunner-observer in a turret amidships. The engine was an air-cooled radial with 14 cylinders, probably the M-88. Corresponding U.S. machines were the Curtiss Helldiver and the Brewster Bermuda.

Few data were available on the state of Russian aircraft production. The fact that a considerable number of British and American aircraft (Spitfires, Hurricanes, Airacobras and Tomahawks) were sent into Russia under lend-lease agreements was an indication that the soviet home industry was insufficient to keep pace with the demands of the year. Airports and Flying Fields.

The defense airport program undertaken by the federal government was not, in most cases, fully understood by the public or even those directly interested in aeronautics, primarily because it involved four separate government agencies —the army, navy, Works Progress administration and the Civil Aeronautics administration. Many pilots interested in airport development did not understand the methods under which the sites included in the program were selected, since frequently sites were included which seemed relatively unimportant from the immediate viewpoint of civil aviation. Nevertheless, as a result of this airport program, the private and commercial pilots of the United States would find with the end of the emergency a greater number of better airports than were ever available before, and the United States would be well on its way to a realization of the 4,000 airports program predicted as needed in the interest of commercial aviation in a CAA survey undertaken in 1938.

This survey which was made possible through the co-operation of state and government officials, airlines and commercial operators formed the basis for the war airport program. It developed information and data with respect to some 4,000 airports throughout the United States, of which approximately 2,000 could be classified only as pastures utilized for the landing and take-off of light aircraft. A handful of the remaining 2,000 could be considered worthy of the designation "airport" with only 5 meeting the Class IV specifications of the CAA and only 31 meeting the standards established for Class III airports. In other words, only 36 airports were then available for all-weather use by all types of aviation.

The army and navy realized the huge expenditure which would be required to provide exclusive military fields for their purposes and hence welcomed CAA sponsorship in the development of commercial airports which could also be used by the army and navy. In this case, airports which were essential in plans for defense could also be utilized for civil aviation both during and after the emergency, and the investment of the federal government for defense would be enhanced by its future value for commercial aviation. Frequently airports which had been or were being developed under this program were occupied by military units under a joint occupancy lease which protected the rights of civil aviation. In a few instances traffic congestion required the removal of private flying and training activities from jointly occupied fields to other airports. In these cases auxiliary airports were made available for the purpose.

The first appropriation for the airport program which became available in Oct. 1940 authorized the construction of 250 airports and appropriated $40,000,000 for the purpose. These funds permitted 200 of the authorized projects to be placed under way. To avoid any loss of time in placing projects under way the service of existing construction agencies was utilized to include the bureau of federal airways, CAA, the corps of engineers, U.S.A., the bureau of yards and docks, U.S. navy and WPA. It was evident that the appropriation would not suffice for the completion of 250 projects and subsequently congress appropriated additional funds in the amount of $33,000,000 for this phase of the program. It also authorized 149 additional airports with an appropriation of $62,000,000 to which $5,000,000 were subsequently added for airports in overseas possessions. Thus the immediate authorization contemplated the development of 399 airports for the appropriations aggregating $140,000,000.

The defense objectives for the additional 149 airports were even more specific than the objectives established for the earlier program. These objectives had in view the provision of 3 Class II or Class IV airports within a radius of 100 mi. of tactical stations to permit a dispersion of activities and varied flight training and similarly a minimum of at least 3 Class III or Class IV airports within a radius of 250 to 400 mi. from the advanced army training schools for training purposes. Specific information showing the location of these airports and their relations to the several strategic areas cannot be given. However, the completion of the program was expected to find the U.S. coastal and southern areas well equipped with modern airports for the first time and hence ready to meet the demands of expanding aviation.

Airport lighting was greatly improved and standardized, more attention was being paid to drainage and the preparation of the sub-grade; and runways were being designed to meet the unit loads developed by the heavy military bombers and civil transport. In this program soil studies were made at each site to determine a suitable type of sub-grade and surface treatment. Cement and asphalt stabilization and concrete were being utilized successfully as required for soil conditions.

As a result of these programs the United States would have with their completion at least 87 Class IV airports and 370 Class III airports, exclusive of strictly military fields.

Federal Airways System.—To serve the mounting volume of commercial and military traffic, the federal airways system was extended and improved. At the end of the year 1942 there were in operation 32,487 mi. of light airways, equipped with radio course signals (known as radio ranges), communications and weather-reporting facilities, and emergency landing fields.

Traffic along these routes was separated and otherwise controlled from CAA centres, which recorded 1,628,400 aircraft operations during the year, a gain of 45% over 1940.

The growing volume of traffic occasioned a ruling during 1941 that all craft flying the airways above 3,500 ft. must be equipped with two-way radio. Another step to insure safe movement of aircraft during the emergency was the passage of legislation authorizing the CAA to establish or take over operation of control towers at airports where there is both civilian and military flying. This work was under way in 1942.

To improve weather-reporting service, an additional 24,400 mi. of teletype lines were leased, bringing the total to 55,790 mi. in addition to the 10,360 mi. used exclusively for traffic control. Ultra-high frequency radio ranges, which transmit with virtually no interference, were put into operation along the New York-Chicago airway as a service test system. Instrument landing systems operating in the U-H-F band were being installed at Washington and Atlanta, with five more being manufactured for use at New York, Cleveland, Chicago, Kansas City and Los Angeles.

Airways Traffic.—Aircraft operations on the airways of the United States more than tripled within a year. With the commissioning of the latest nine new airway traffic control centres, the CAA had its entire 35,000 mi. of airways controlled from 23 centres spotted about the country. Each of these centres handled an average of 27,000 operations during March 1942 compared with 8,000 handled in the same month in 1941 by each of the 14 centres then functioning. The increase, CAA officials believed, was due primarily to the large amount of military flying along the airways. More than 70% of traffic on the airways in 1942 was by military aircraft, while the 17% of the traffic total chargeable to airlines represented almost entirely the movement of military personnel or businessmen on necessary travel in the war effort.

Extending its coverage of aeroplane movements from "ramp to ramp" at airports where such was requested by the war department, by the middle of April 1942 the CAA was operating 42 airport traffic control towers, and by the end of June 1942, 20 more were under CAA control. Of these, 25 were newly established towers at airports where none was formerly maintained, and 37 were taken over from municipalities. All this airport control work was requested from the CAA by the army air forces due to the large amount of military activity on the field concerned, and the desire to have a federal agency controlling traffic. These 42 towers handled an average of 9,200 such operations during March 1942.

Airport Towers.—The importance of complete co-ordination between airport and airway traffic control was reflected in the tremendous increase in aircraft operations handled by the CAA's airway traffic control centres. For instance, more aircraft operations were handled by these centres in the single month of Jan. 1942 than during the entire fiscal year ending June 30, 1940. The number of operations for Jan. 1942 was 659,180, as against approximately 400,000 for the year ending June 30, 1940. Viewed in another light, the total operations in January of 1942 represented a 600% increase over the total, 106,437, in Jan. 1941.

Traffic clearances issued by the CAA's 18 airway traffic control centres operating in Jan. 1942 totalled 171,445, as against 68,472 in Jan. 1941. The high efficiency of operation was indicated by the percentage of clearances delivered, which was 99.4% in Jan. 1941 and 99.5% in Jan. 1942.

Of the 659,180 aircraft operations handled in Jan. 1942, 116,132 involved air carrier aircraft, 404,969 involved army aircraft, 62,591 navy aircraft, 387 coast guard aircraft, and 75,101 itinerant or private aircraft.

On March 1, 1942, the last of 23 airway traffic control centres was commissioned. This provided airway traffic control service for practically all the civil airway system. The remaining portion was planned to be included in control areas of the established centres in the near future.

Another significant development of air travel was the increasing resort to instrument approaches. A survey by the air traffic control division of the CAA showed that for the period of July through Dec. 1941, a total of 8,929 instrument approaches were made at the 103 airports in the country under the jurisdiction of the CAA airway traffic control service.

New Developments.—*Landing Strips.*—During 1942 the first emergency landing strip, capable of handling the largest airliners and the biggest bombers of the air forces, was completed by the federal government. Paved with 8 in. concrete, the first strip was 8,000 ft. long, 500 ft. wide and had a hard surface 7,000 ft. by 150 ft. It was the first of the flight strips to be constructed under a program authorized by congress for which $10,000,000 had been allocated by that body.

Portable Turntables for Airports.—Pilots, airline officials and airport managers expressed their approval of a portable type of turntable for large aircraft, developed and installed at the Washington National airport. The turntable was 5 ft. 6 in. in diameter, had a 4 ft. 6 in. revolving plate and was only 2 in. in height. The steel ballbearings were protected against dust and dirt by 2½-in. felt seals. The unit weighed approximately 700 lb., was self-draining and required no anchorage to, or cutting of the pavement surface. The unit performed successfully under a one-wheel load of 20,500 lb. Very little deflection of the top plate occurred and rotation was free under all loads imposed.

In addition to its possible military application, the turntable was a distinct contribution to civil aviation. Its manufacture required only small quantities of critical materials, and its use would prevent loss of rubber on tires and injury to pavement surfaces through the elimination of locked wheel turns. Landing gear failures too had been traced to tortional strain induced in the landing gear while making a locked wheel turn on a crowded airport apron.

Airport Lighting.—The hazards of landing and taking off at night were greatly reduced through the development of effective airport lighting. Perhaps the best example of this service was the new Washington National airport, which was termed the best lighted airport in the world. This airport's lighting system included all the normal airport lights, such as boundary, range, obstruction, floodlighting, and contact lighting and had, in addition, a complete installation of traffic control and taxi guidance lighting. So complete was the equipment and planning of the airport's lighting that even if all radio communication between plane and ground should be halted, operations of aircraft landing, taxiing and taking off could be controlled from the airport tower by a system of lights with safety.

The lighting at the Washington airport was designed for the needs of the largest and most heavily used commercial airport. This complete system might not be needed on smaller airports. However, it was important that all lighting used on any airport conform to standard patterns, using equipment which gave uniform results.

Approach Control.—Under a co-ordinated approach control procedure, the CAA planned to offer air traffic of the U.S. a speedier, unified air traffic control service. Approach control required delegation of jurisdiction over arriving and departing aircraft from an airway control centre to an airport control tower. The procedure was made possible by the fact that the CAA had taken over most of the major airport towers in the U.S. Approach control presented these changes: (a) The pilot would maintain direct communication with the tower controller through the voice channel of the range after receipt of a clearance from the centre having jurisdiction over such direct communications; (b) Under instrument flight rules, an aircraft would be cleared to a holding fix (range station or other radio fix) by the centre. The centre would include instructions in the holding clearance for the aircraft to hold "until further advised by the (name of airport) tower." All subsequent instruction, relative to holding, descent and approach would be issued by the tower on the range's voice channel.

There were a number of additional research projects which had been carried on by men in aviation which, unfortunately, cannot be disclosed at this time. (*See* also AIR FORCES OF THE WORLD; AVIATION, CIVIL.) (E. M. E.)

Air Races.

Air races were completely nullified during 1942 in order to put forth every bit of energy in the aeroplane industry toward winning the war. For the obvious reasons that production lines were tied up making bombers and pursuit planes, and that all available pilots were being used in the vital business of fighting the enemy, or transporting war cargo, both factors essential to conducting an air race were nonexistent. By the same token, European countries had no air races whatsoever, a condition which had existed for three years.

First among the annual U.S. races postponed were the National Air races, the Bernarr Macfadden Trophy race, the Firestone Trophy race, the Colonel Batista Cup race, and the Culver Trophy races in California. (T. J. D.)

Air Raid Defense.

U.S. air raid defense in 1942 began far from the nation's shores. In the east, and in part of the south, warnings of enemy raiders might be received from ships at sea and from patrol planes; two friendly nations guarded the approaches from the north and south land boundaries; and in the west, there was again partial dependence on ships and patrol planes. Nearer the shorelines defenses thickened. From all the boundaries, well into the interior, ran lines of observation posts, manned day and night by hundreds of thousands of volunteer plane "spotters," operating directly under the fighter command of the army air forces. These observers noted the passage of every plane, and reported the type, number, height and direction of flight of all planes, by telephone, to a designated "filter centre." There, messages from many observers were evaluated.

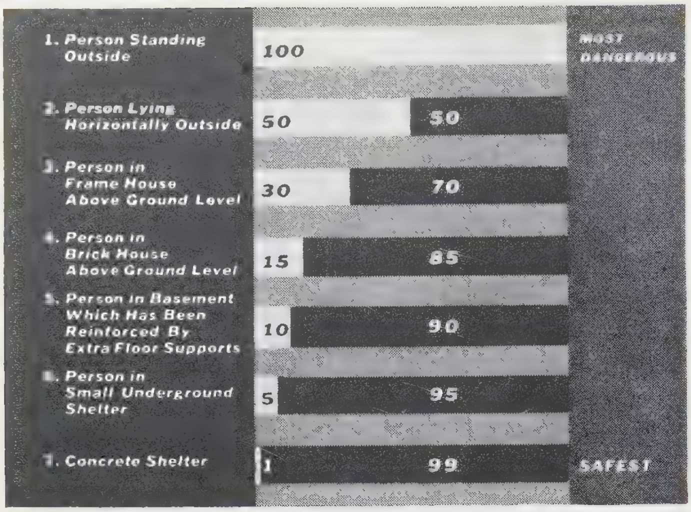
The army in 1942 was in control of the air raid warning system, but the warning district centres were operated by civilians. The warning district centre was responsible for telephoning warnings to all control centres in the warning district. The control centre was made the clearing house for action at the point of possible attack, and was to receive advance warning signals from the warning district centre to permit prompt mobilization of civilian and industrial forces.

"SMOKEOUTS" to hide U.S. factories from enemy bombers in daytime were successfully tested at Gary, Ind., in 1942

In Feb. 1943 new regulations for uniform air raid signals were ordered for the 16 Atlantic seaboard states and the District of Columbia, to permit earlier blackout and mobilization of civilian defense personnel, and minimum interference with essential war production and transportation. The first public warning—a steady two-minute blast of sirens or horns—was to be given when the control centre received the "blue" warning and indicated the probability of an enemy air raid. Civilian defense forces were to mobilize and the blackout was to be complete except for certain street and traffic lights. Civilian and traffic movement was to be permitted under slight restriction.

On the "red" warning, a second public air raid alarm was to be sounded by a series of short blasts on horns or whistle, or warbling notes of the siren. This signal was designated to mean that enemy planes were practically overhead, and called for a blackout of all but authorized emergency lights. The public was to take shelter, and all but emergency traffic stopped. However, if there had been insufficient time for sounding the "blue" alarm, the "red" signal might be the first audible public alarm.

After the "red" alarm, when the raiders had either dropped their bombs or left the immediate vicinity, the "blue" alarm was to be sounded again, thus permitting an early return to conditions under which essential activities could be resumed, pending the "all-clear."



RELATIVE PROTECTION during an air raid, according to figures compiled in 1942 and based on actual experience by the British

No audible "all-clear" signal was prescribed in the regulations. This was to be indicated by the turning on of street lights, by radio and telephone announcements and by air raid warden communications. Communities might adopt audible "all-clear" signals, provided such signals did not resemble the "blue" or "red" warning signals.

The U.S. Office of Civilian Defense recommended the adoption of these regulations by all states except those in the western defense command, which in 1942 was already operating under a uniform system adapted to its own needs and approved by the war department. Uniform air raid alarm systems helped to prevent confusion and public alarm in all but the area which might be the real objective of the enemy. Blackout and dimout regulations emanated from the army service commands and might be put in force either before, or upon, the sounding of the alarm. Such regulations, whenever put into effect, were an integral part of nation-wide air raid defense.

At the sound of the alarm the last line of civilian defense was to go into action—the air raid wardens, auxiliary firemen and policemen and all other units in the protective services. There were 20 such units, including the staff corps and volunteers-in-training, each assigned to its own specialized tasks in case of air attack. Taken together, these units in 1942 made up the U.S. Citizens Defense corps, the operational arm of civilian protection. This defense corps was distinct from the U.S. Citizens Service corps, both of which stemmed from the U.S. Office of Civilian Defense. The service corps volunteers in 1942 undertook a wide range of civilian war activities not connected with the actual protection of life and property.

In the type of air raid shelters, the U.S. system of 1942 differed sharply from the British, for it seemed inadvisable to divert labour and material resources into comprehensive shelter construction in a nation not immediately subject to sustained enemy air attack. The U.S. shelter system provided for the best use of buildings already constructed.

There were other ramifications of U.S. air raid defense in 1942 just as important as those described above. Actual raids in other countries during World War II had proved that the greatest single danger was that of fires during and after a raid. To meet this threat the U.S. Office of Civilian Defense not only encouraged the training of auxiliary firemen and fire watchers in great numbers but also provided for a substantial increase in fire equipment available for those cities in the "target areas." A very large proportion of the $100,000,000 granted by congress early in 1942 to the OCD was spent in the manufacture and distribution of large and small fire-fighting equipment, ranging from hose couplings to 500-gallon-per-minute mobile fire fighting units.

In co-operation with other federal agencies the Office of Civilian Defense organized the Forest Fire Fighting service, "triple-FS," which protected valuable forest lands against both regular fire hazards and the increased war dangers. The Office of Civilian Defense at the end of 1942 planned a still greater expansion in all the lines of fire defense, taking into account the greater efficiency of new types of incendiary bombs.

Another part of the structure of air raid defense in 1942 was the civil air patrol, with more than 20,000 trained civilian pilots, twice that number of substitutes, mechanics and field attendants, and thousands of privately owned aircraft. The duties of the civil air patrol included courier service, towing of aerial targets, observation trips over blacked-out areas, coastal patrol, and emergency aid in case of actual air attack.

Finally, careful plans were made for evacuation of areas attacked or threatened. Extensive surveys were made, with the co-operation of state and local defense authorities, to determine available accommodations and transportation for populations in the danger areas.

The successful operation of U.S. civilian defense in 1942 rested primarily upon state and local authorities, under a decentralized plan. The OCD was responsible for the co-ordination of federal, state and local bodies into a functioning nation-wide organization. The national office advised state and local defense councils on training and organization procedure, set up standards for training and equipment, approved the use of official insignia, loaned many items of equipment other than fire protective equipment, and passed upon many devices designed for civilian protection manufactured by private concerns, recommending to local defense councils those devices which met prescribed standards of efficiency and usefulness.

For technical assistance the Office of Civilian Defense in 1942 turned to the war department and to the chemical warfare service of the United States army and was able also to call upon other divisions of the government. (*See* also Civilian Defense; London: *Civil Defenses in 1942.*) (J. M. Ls.)

A.L.A.: *see* American Library Association.

Alabama. Alabama is one of the "deep south" states of the United States, admitted to the union 1819. Area, 51,609 sq.mi.; pop. (1940) 2,832,961. Capital, Montgomery (78,084). Cities with larger population were Birmingham (267,583) and Mobile (78,720). Of the state's population in 1940, 855,941 were urban, or 30·2%. There were, in 1940, 1,847,850 whites; 983,290 Negroes; 574 of other races; 2,821,004 native-born; 11,957 foreign-born; 47·2% of the total population was rural.

History.—Chauncey Sparks, Democrat, was elected governor Nov. 3, 1942, to succeed Frank M. Dixon. Eight of the nine congressional representatives, all Democrats, were re-elected. The new representative, from the ninth district, defeated Luther Patrick, the incumbent, in the Democratic primaries run-off election in June. Aside from Gov. Sparks, the principal state officers elected in Nov. 1942 were: Handy C. Ellis, lieutenant governor; Warren C. Lusk, treasurer; John Brandon, auditor; Howell Turner, secretary of state; Joe N. Poole, commissioner of agriculture; and Elbert B. Norton, superintendent of education.

Education.—State appropriations in 1941 amounted to $14,795,041. Total revenues from all sources in 1941–42 were $30,424,454. Illiteracy among whites between 10 and 20 years was 1.9%, Negroes 2.6%. There are seven state-supported institutions of higher education for whites and three for Negroes.

Charities and Correction.—The state supports many philanthropic and penal institutions: institutions for the deaf and blind of both races; hospitals for the insane of both races; a school for feeble-minded children; training schools for wayward white boys and girls; and a reformatory school for Negro boys, etc.

CHAUNCEY SPARKS, Democrat, elected governor of Alabama Nov. 3, 1942

Banking and Finance.—In 1941 there were 66 national banks with capital stock, surplus and undivided profits of $50,462,000, deposits of $233,731,000 and total assets of $268,659,000; 151 state banks with a capital stock surplus and undivided profits of $22,224,499, deposits of $96,320,940 and total assets of $111,644,594. State receipts for the fiscal year 1939–40 were $66,128,786; disbursements, $65,046,810; state debt, $64,703,000.

Agriculture.—The total income of farmers in Alabama in 1940 was $115,463,000, divided as follows: cash income from crops, $62,006,000; cash income from livestock, $27,606,000; government payments, $25,851,000. In 1939 farm lands and buildings were valued at $408,782,488.

Table I.—*Leading Agricultural Products of Alabama, 1942 and 1941*

Crop	1942 (est.)	1941
Corn, bu.	44,422,000	51,228,000
Oats, bu.	4,580,000	4,400,000
Cotton, bales	925,000	790,000
Potatoes, bu.	3,900,000	5,600,000
Peanuts, lb.	462,000,000	252,000,000
Tame and wild hay, tons	702,000	822,000
Tobacco, lb.	235,000	305,000

Manufacturing.—In 1939, by the federal biennial census of manufactures, there were 2,052 manufacturing establishments hiring 126,215 workers and producing goods valued at $574,670,690. The leading manufactures were cotton textiles (valued at about $92,000,000; spindles in operation, 1,835,909), iron and steel and electricity. Corporation and municipal production of electricity amounted to about 900,000 h.p., and the TVA plants were capable of producing slightly more. There were more than 6,000 mi. of rural electric lines. Other important industries: lumber, blast furnace products, cast iron pipes and fittings, coke oven products, cotton seed oil and meal, paper, aluminum, cement, chemicals, fertilizers, meat packing and shipbuilding. War demands caused expansion of old industries and the rise of new industries, such as powder, aluminum and chemical manufacturing in 1941 and 1942.

Mineral Production.—The total value of Alabama's mineral production in 1939 was $54,124,382; in 1938 it was $46,296,293.

(A. B. Mo.; X.)

Table II.—*Principal Mineral Products of Alabama, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Pig iron	$43,902,681	$29,190,091
Coal	27,708,000	26,769,000
Coke	10,917,559	9,888,292
Iron ore	9,971,024	7,341,620
Cement	6,690,765	6,114,246
Stone	2,516,584	1,809,379
Clay products	2,306,712	1,487,067

Alaska.

Alaska is one of the two incorporated territories of the United States. Alaska has an area of 586,400 square miles, approximately one-fifth the area of the 48 states, and lies between the meridians 130° W. and 173° E. longitude and between the parallels of 51° and 72° N. latitude. It is bounded on the north by the Arctic ocean, on the west by the Arctic ocean, Bering strait and Bering sea, on the south and southwest by the Pacific ocean and on the east by Canada.

The population of the territory, which in 1941 had reached an all-time high (72,524 in the 1940 census as against 59,278 in 1930) was further increased in 1942 by the arrival of many defense construction workers and military personnel, although there was some exodus of civilians. The school population, after reaching new highs in the cities in the school year 1941–42 but declining slightly in the rural communities, dropped sharply in the 1942 fall enrolment.

In 1942 Alaska figured prominently in World War II. Early in June, the Japanese raided the naval base at Dutch Harbor

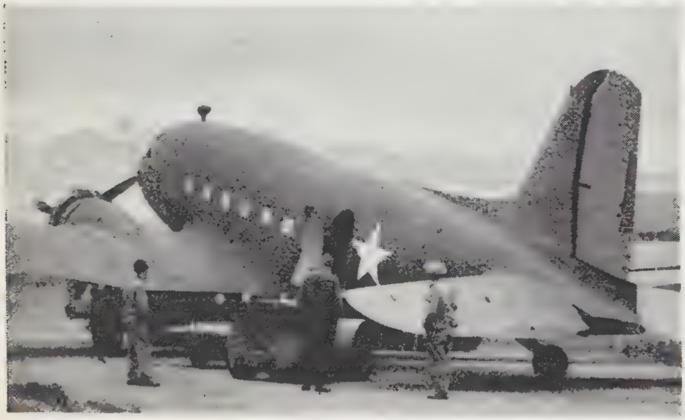
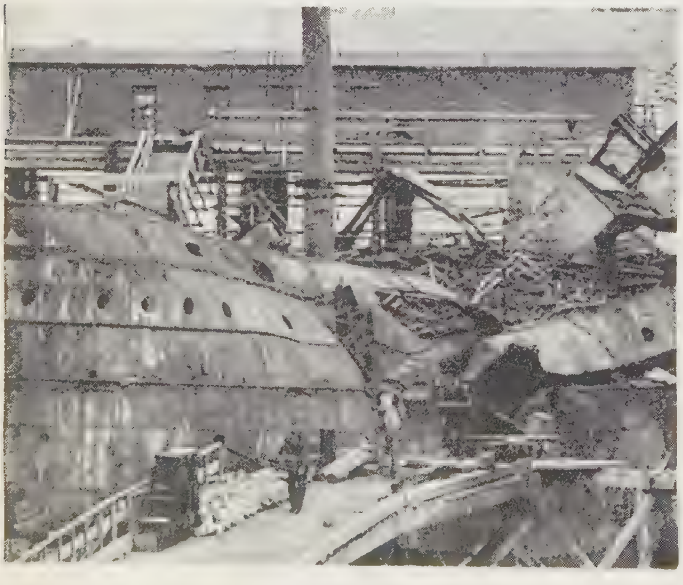
THE LONELY ANDREANOF ISLANDS in the western Aleutians were occupied by an armada of U.S. troops Aug. 30, 1942, for use as advanced bases against the Japanese

CONVERTED AIR LINERS were pressed into service in 1942 to fly supplies to airports and other military bases in Alaska



THE STATION SHIP "NORTHWESTERN," used as workers' barracks at Dutch Harbor, Alaska, was destroyed June 3, 1942, when Jap bombers raided the base



FIRST CASUALTIES of the war in the Aleutians were landed at Seattle harbour late in June 1942

from the air and a few days afterward were found to be occupying the three western-most Aleutian islands, Attu, Agattu and Kiska. Alaska defenses were strengthened, meanwhile, and toward the end of August a U.S. expeditionary force moved westward and landed on one of the unoccupied Andreanof islands of the Aleutians, from which shortly thereafter a continuing aerial bombardment of Kiska, the most strongly held of the Japanese islands, was undertaken with such effectiveness that by the middle of October all Japanese planes there had been destroyed. The Japanese meanwhile abandoned Attu and Agattu, concentrating their defenses on Kiska.

The International highway to Alaska, the construction of which had been urged upon the military for several years preceding the war, was begun in March, 1942, and a winter road was completed before the end of the year. This highway connects air fields previously constructed by the Canadian authorities and extends from Edmonton by way of Forts St. John, Nelson, Watson Lake, Whitehorse and Kluane Lake straight toward the Alaska highway system, with which it connects at Big Delta. Meanwhile also, the Richardson highway was improved and the connecting Glenn highway between it and the system of roads out of Anchorage was nearing completion. By the end of 1942, it was possible to drive from New York city to Anchorage, Alaska, by automobile.

In October, the War Production board ordered the closing of U.S. gold mines for the purpose of conserving vital materials and utilizing the labour employed in this industry unessential to the conduct of the war. This order seriously affected Alaska since gold is its second industry (second to salmon). In the preceding two years, gold production had been: 1939, $23,279,000; 1940, $26,178,000. By way of compensation, however, an intensive exploration for critical and strategic minerals was undertaken.

The salmon catch was also reduced somewhat in 1942, the average pack of 6,000,000 cases being diminished to approximately 4,500,000.

The post of commander of the Alaska sector (Comalsec) created in 1940 and held by a captain in the United States navy, was advanced in importance in 1942 and was held by a rear admiral.

In June 1942, certain outlying islands in the Aleutians, and also the Pribilofs, were evacuated of their civilian population, who were temporarily resettled in southeastern Alaska. (*See* also World War II.) (E. Gru.)

Alaskan Highway: *see* Roads and Highways.

Albania,

a kingdom in the western part of the Balkan peninsula, occupied in 1939 by Italy. Area 10,631 sq.mi.; pop. (census 1930) 1,003,068; (estimate 1939) 1,063,000. Capital, Tirana. Chief cities: Tirana (30,806); Scutari (29,209); Koritsa (22,787); Elbasan (13,796); Valona (9,100). Religion: Mohammedans (688,280); Orthodox Christians (210,313); Roman Catholics (104,184). Prime minister (1942): Mustafa Merlika Kruja.

History.—Albania was invaded by Italy on Good Friday, 1939, and its union with Italy was proclaimed. The Italian aggression against Greece in Oct. 1940 brought a swift Greek penetration of Albanian territory after the defeat of the Italian invading forces, and for several months the Greeks held part of Albania, until the German victory in April 1941 forced evacuation by the Greeks. Thus Albania came again entirely under Italian administration, and fascist laws were reintroduced throughout the country. A new Albanian government was formed under Mustafa Merlika Kruja, an Albanian who had spent much of his life in Italy and was a member of the Italian Senate. Other members of the new cabinet were the head of the Albanian fascist party, Kazazi, the minister of justice, Hasan Dosti and the minister of public works, Ilias Agushi.

At his press conference on Nov. 30 Cordell Hull, secretary of state of the United States, praised the spirit of resistance of the people of Albania against Italian occupation. In an official statement on Dec. 10 Mr. Hull declared that the restoration of a free Albania was inherent in the Atlantic Charter. Guerrilla warfare in Albania continued throughout 1942.

Education.—Though primary education is nominally compulsory, illiteracy was still very high in 1942, especially among women. In 1939 there existed 663 state elementary schools with 38,988 male and 17,948 female pupils and 19 secondary schools with 4,810 male and 1,425 female students. There were no institutions of higher education.

Defense.—The Albanian army consisted in 1938 of 13,040 men. Military service was compulsory. A small navy of light craft was based on Durazzo. On May 29, 1939 the Albanian army was incorporated into the Italian army.

Trade and Finance.—The value of the foreign trade for 1938 amounted to $9,644,000. Imports amounted to $6,719,000, of which 37.2% came from Italy and 6% from the United States. The total exports amounted to $2,925,000, of which 68.4% went to Italy and 4.5% to the United States. The major import articles were cotton and cotton goods, corn, benzine and woolen goods; the main exports were wool, hides and furs, cheese, cattle, eggs and bitumen. Of the mineral wealth of the country aluminum and petroleum were of importance. In 1939, 229,278 tons of crude petroleum were produced. With the economic life of the country still on a very primitive level there exists practically no modern industry. Albania has no railroads but a good highway system, improved by the Italians for strategic reasons. The Albanian currency is pegged to the Italian currency; an Albanian franc equals 6.25 lire (32.89 cents U.S., June 1941). The external debt of Albania amounted to $15,000,000 in 1938.

Bibliography.—Vandeleur Robinson, *Albania's Road to Freedom* (1942). (H. Ko.)

Albemarle, Arnold Allan Cecil Keppel,

8th Earl of (1858–1942), British peer, was born June 1 in London. A veteran of the Boer war, he was an officer in Britain's auxiliary forces. He represented Birkenhead in the house of commons, 1892–94. He died in Quidenham, England, April 11.

Alberta.

The most westerly of the three prairie provinces of Canada (*q.v.*). Area, 255,285 sq.mi.; pop. (1941) 796,169, of which the greater part was rural. The largest city is Edmonton (92,404), the provincial capital. The climate of Alberta is considerably moderated (from the extreme continental climate of the middle west) by the chinook winds which blow across the mountains from the Pacific ocean. The natural resources of Alberta are extremely varied. In the south, there are considerable deposits of coal in the neighbourhood of Lethbridge, of which 6,969,864 tons were mined in 1941. In the north, natural gas and petroleum are developed in the Turner valley and other areas. In 1941, 26,365,770 cu.ft. of natural gas, with a value of nearly $5,000,000, were produced. The production of petroleum in the Turner valley and other Alberta fields advanced from 1,312,368 bbl. in 1936 to 9,928,162 bbl. in 1941. In 1940 the value of the product was over $10,000,000. The Turner valley region produced fully 97% of all the petroleum in Alberta. The natural gas and petroleum industries, like the coal industry, suffer from lack of a large near-by market, central and eastern Canada being supplied from the neighbouring United States fields.

In all parts of Alberta, agriculture is followed extensively, representing a capital outlay of over $600,000,000.

In 1941, of the 12,067,113 ac. in cultivation, more than a half was under wheat, 2,798,722 ac. under oats and 1,543,063 ac. under barley.

Local administration is in the hands of a provincial parliament; Alberta in 1942 returned to Ottawa 17 members of the house of commons, and six senators to the senate. The Social Credit party, under the leadership of William Aberhart, continued in office throughout 1942. The political event of greatest significance was the invalidation by the supreme court of the Alberta Debt Adjustment act on Dec. 3, 1941. The act had prohibited the forced collection of debts on resident farmers without the assent of the Debt Adjustment board which was set up under the act.

(J. I. C.)

Alcohol, Industrial.

Production of alcohol in the United States in 1942 was the subject of continuous controversy. There were two urgent and somewhat conflicting needs for it: in the manufacture of smokeless powder and as a basic material for synthetic rubber tires. Conflict also occurred among producing groups as to how production might best be expanded. During the year, the manufacture of beverage alcohol was greatly reduced by the conversion of the whisky distilling industry to the manufacture of alcohol for war purposes. Varying figures were announced as to the requirements of alcohol production, running from a preliminary WPB announcement in 1941 calling for 175,000,000 gal. to a request for 356,000,000 gal. in April 1942. This latter figure was an increase from a previous requirement of 275,000,000 gal., which represented about three times the normal demand for industrial alcohol.

At the beginning of 1943 plant capacity for the year was placed at 490,000,000 gal. New plants had been authorized to be built at Kansas City, Mo., Omaha, Neb., and Muscatine, Ia., with a combined capacity of 40,000,000 gal. Still other plants were projected for the corn and grain belts. Further withdrawal of food grains, lest they affect the food supply severely, was a salient factor in the controversy over alcohol, involving therein the congressional farm bloc, the department of agriculture, OPA, WPB, whisky distillers and the sugar and alcohol consuming industries. If, as had been proposed, the production of alcohol was to be stepped up by 100,000,000 gal. by using sugar, a further cut of 12% would be required in the consumption of sugar, already strictly rationed. The alcohol required for manufacturing rubber and smokeless powder is 190 proof. Whisky distillers, who use only grain in producing alcohol, experienced difficulty in producing such high-proof alcohol, and delays in production were encountered through the necessity of introducing new equipment in distilleries. Trade reports in Sept. 1942 said the distilleries were steadily increasing production and had at that time reached the rate of 135,000,000 gals. per year. A source of alcohol, entirely new to America, was seen in the beginning of construction in 1942 at Thorold, Ont., of a plant to make alcohol from sulphite liquor, a waste product from the manufacture of wood pulp for paper. The plant was being constructed by the Ontario Paper Co., a subsidiary of the *Chicago Tribune,* to utilize methods of sulphite liquor distillation in commercial use in Europe, particularly Sweden. If, it was estimated, all sulphite liquor wasted in U.S. wood pulp mills were so distilled it would provide enough alcohol to manufacture 90,000 tons of synthetic rubber annually, and relieve the other sources of primary supply.

Alexander, Sir Harold Rupert Leofric George

(1891–), British army officer, was the 3rd son of the 4th earl of Caledon. He was educated at Harrow and Sandhurst. He received his commission in the Irish Guards in 1911. At the end of World War I he was commanding a battalion with the rank of lieutenant colonel. In 1919 he commanded a landwehr of the Lettish army during the confused fighting in the Baltic provinces. In 1934 he was given command of a brigade in India; in 1938 he became major general and was given the 1st division. In Sept. 1939 he took the 1st division to France with the B.E.F. Later as lieutenant general he was promoted to command the 1st corps. At Dunkirk it fell to him to organize the final defense and evacuation, and he was among the last men to leave the beach. After Dunkirk, he was made general officer commanding-in-chief, southern command, serving in this capacity till he went to Burma in Feb., 1942, as general officer commanding at a critical period in the campaign. In Aug. 1942, General Alexander was sent to the middle east as commander-in-chief, in time to break the full-scale attack launched by the enemy at the end of August against the El Alamein position. On Oct. 23, 1943, he launched the great British counteroffensive against Rommel's army.

Alfalfa.

A record crop of alfalfa hay was harvested in 1942 in the United States, 36,547,000 tons, compared to 32,338,000 tons in 1941 and a ten-year (1930–39) average of 24,907,000 tons. The acreage harvested in 1942 was 15,851,000 ac. as against 14,963,000 ac. in 1941 and a ten-year average of 12,867,000 ac. This was also a record acreage in the United States. Harvesting early cuttings was more difficult than usual because of rain, but conditions were favourable for harvesting later cuttings, and the yield was thereby increased to 2.31 tons per acre, compared to 2.16 tons in 1941 and a ten-year average of 1.93 tons per acre. Production of alfalfa seed in 1942, however, was the smallest in ten years—974,500 bu. of thresher-run seed. Early frost reduced acreage that ordinarily would have been harvested for seed, particularly in Montana and the Dakotas.

U.S. Production of Alfalfa Hay in Leading States, 1942 and 1941 and the 10-Yr. Average

(in thousands of tons)

States	1942	1941	10-yr. average	States	1942	1941	10-yr. average
California .	3,440	3,198	3,038	Nebraska .	1,593	1,106	1,533
Minnesota .	3,170	2,776	1,659	Illinois . .	1,411	1,369	767
Iowa . . .	2,992	2,426	1,504	Colorado. .	1,369	1,389	1,265
Wisconsin .	2,859	2,698	1,459	Montana .	1,253	1,202	1,061
Michigan .	2,268	1,813	1,422	Indiana . .	1,142	833	578
Idaho . . .	1,852	1,911	1,886	Ohio . . .	1,107	923	719
Kansas . .	1,720	1,247	972	New York .	1,035	749	513

Production in all other states was less than 1,000,000 tons apiece in 1942. The foregoing are estimates as of Dec. 1, 1942, by the U.S. department of agriculture. (*See* also HAY.)

Aliens.

The alien registration of 1940 provided the United States government with its first nation-wide inventory of the noncitizen population in continental United States and its territories. The Alien Registration act, 1940, which authorized the department of justice to conduct the registration, required that a record be made and kept current of aliens in the United

JAPANESE FROM THE PACIFIC COAST entering an internment camp in Owens valley, Calif., in March 1942, after the U.S. government had ordered their evacuation inland from strategic areas

States. The act provides that all aliens (except foreign government officials and members of their families) who remain in the United States, including Alaska, Hawaii, Puerto Rico and the Virgin Islands, 30 days or longer must be registered and, if 14 years or older, fingerprinted.

The act required also that registered resident aliens notify the authorities in writing of each change of residence and new address within five days from the date of such change. Any registered alien who is temporarily in the country as a student, visitor or otherwise, is required to notify the authorities in writing of his address at the expiration of each three-months' period of residence in the United States.

Aliens currently arriving in the United States are being registered before admission. As of Dec. 31, 1940, there were 4,921,452 registered aliens in the United States and territories, excluding seamen and aliens registered abroad in consular offices. This number was considerably reduced during 1941 and 1942 so that the total as of Dec. 1942 was 4,520,374. The reduction was due to departures, deaths and the naturalization of civilian aliens as well as of aliens serving in the armed forces.

Analyses made by the alien registration division of the immigration and naturalization service revealed that the median age of the alien population, as of the 1940 registration, was 48 years, as contrasted with the median age of 28 years for the native-born and naturalized citizens. The United States census of 1940 showed that 31% of the general population was under 18 years of age; 42% was in the 18 to 44 years age group, and 27% was in the age group of 45 years and over. This is sharply contrasted with the age-group distribution of the alien population. Among them only 1.5% was under 18 years; 34% was in the group of 18 to 44 years and 64.5% was 45 years and over. This factor accounted for a much higher death rate among aliens than among the general population.

Almost 75% of the registered aliens were born in Europe. Another 20% came from neighbouring countries in North and Central America, and the remainder from South America, Africa, Asia and the islands of the Pacific. Listed below are ten countries in rank order of registered aliens, as of Dec. 31, 1940:

Italy, including Sicily and Sardinia	695,472
Canada	447,898
Poland	442,547
Mexico	416,690
Russia, including Russia in Asia	366,827
Germany	314,870
Great Britain, including England, Scotland, and Wales	291,557
Austria	191,600
Eire	158,154
Hungary	116,701

Further studies indicated that more than 80% of the registered aliens were living in the following ten states: New York, 1,234,995; California, 531,882; Pennsylvania, 365,229; Massachusetts, 360,416; Illinois, 320,053; Michigan, 296,834; New Jersey, 276,026; Texas, 209,450; Ohio, 200,322; Connecticut, 157,120.

The total noncitizen population of the country consisted of 2,629,215 females and 2,292,237 males; hence, there were 115 women for every 100 men. There were 674,622 men in the age group 18 to 45. Of this total there were only 109,751 that had any previous military experience. One-fourth of this number had served with the armed forces of the United States.

Out of the total registered, more than 70% arrived in the United States prior to 1924, and among these, more than 900,000 actually came prior to 1906. Approximately 700,000 were found to be illiterate. Of this total, 67% were women and 33% men. The percentage of illiteracy rises sharply among those forty-five years of age or older, in both groups.

A large percentage of aliens have family ties in the U.S. Even when measured within the closest range of family relationship, by inclusion of spouse only, spouse and child, and children only, it represents 61%. This percentage climbs sharply with a broader range of family ties by inclusion of brother, sister and other immediate blood relations.

Naturalization.—Of the nearly 5,000,000 aliens who registered under the Alien Registration act of 1940, approximately half were eligible for American citizenship. The registration and unsettled world conditions tended to increase their desire to achieve United States citizenship. In the fiscal year 1942, 221,796 declarations of intention were filed, as compared with 224,123 in 1941 and 203,536 in 1940. Petitions for naturalization numbered 343,487, which is the highest number filed during any fiscal year since June 30, 1906 when the federal government took over supervision of this activity.

Certificates of naturalization were issued to 270,364 persons during the fiscal year of 1942. The nations to which these new citizens formerly owed allegiance were: British empire, 90,405; Poland, 35,757; soviet Russia, 26,811; Italy, 18,663; Germany, 12,360; Czechoslovakia, 11,106; Sweden, 9,241; Yugoslavia, 7,745; Greece, 5,873; Hungary, 3,794; all other countries, 47,609.

Alien Enemies.—Under the Nationality act of 1940 alien enemies include natives, citizens, denizens, and subjects of the countries against whom the United States has declared war. In 1942 these countries were Japan, Germany, Italy, Hungary, Rumania and Bulgaria. By authority of presidential proclamations of Dec. 7 and 8, 1941, and Jan. 14, 1942, a series of regulations was promulgated by the department of justice affecting the conduct of citizens or subjects of Japan, Germany and Italy 14 years of age or older. On Oct. 12, 1942, aliens of Italian nationality, except those already interned or under parole, were excepted from the regulations for alien enemies by order of the attorney-general.

Although citizens or subjects of enemy countries other than Germany and Japan are not required to observe any of the regulations prescribed for alien enemies, they are subject to arrest and detention as "alien enemies" if, at any time, the apprehension of any of them is deemed necessary to maintain national security. The regulations affecting aliens of German and Japanese nationalities place restrictions on their travel, and prohibit them from owning certain articles, such as cameras, short-wave receiving and transmitting sets and firearms. They are not permitted to make any air flight, or to change their place of abode or employment without notifying authorities. The regulations require them also to possess and carry certificates of identification; prohibit them from residing in or entering any areas designated as "prohibited areas," and from residing in areas designated as "restricted" areas except under conditions prescribed by the authorities.

Aliens of enemy nationalities who are considered dangerous or who violate the regulations are subject to summary apprehension. Such aliens receive hearings before alien enemy hearing boards consisting of prominent citizens from the alien's own community. On the basis of the recommendations made to the attorney-general by the boards, apprehended aliens are either interned for the duration of the war, paroled, or released unconditionally.

Japanese Relocation.—When the United States entered the war in Dec. 1941, there were more than 100,000 persons of Japanese ancestry living in the far western states. Approximately two-thirds of them, born in the United States, were American citizens. The aliens, *Issei,* are an older group who came to the United States as labourers and farm workers. Their average age is around 60. The citizens, *Nisei,* are largely a young group, most of them educated or being educated in American schools. Their average age is around 22. (E. G. H.)

The Jan. 29, 1942 order of Attorney-General Francis Biddle creating restricted zones along coastal areas and regulating the movement of enemy aliens therein, provoked a few days later a recommendation to the president by Pacific coast congressmen that all persons of Japanese ancestry be removed from these restricted areas. On Feb. 19 an executive order authorized the secretary of war to prescribe military areas within which civilian movement might be restricted and from which any or all persons might be excluded. Lieutenant General John Lessene DeWitt, commanding general of the western defense command, embracing the western states, shortly thereafter invited the voluntary migration of the approximately 110,000 persons of Japanese ancestry living in the three coastal states and Arizona, this despite the fact that approximately 75,000 of them were American citizens.

In the light of the unfavourable publicity attaching to the Japanese, the states in the mountain area and midwest to which they attempted to remove did not welcome the migrants and in some cases they were forcibly ejected. The voluntary evacuation was terminated on March 29 by an order providing for the systematic transfer of all persons of Japanese ancestry to selected assembly centres. The western defense command created the Wartime Civil Control administration under Colonel C. R. Bendetsen on March 14, to take charge of the removal. This was followed on March 18 by an executive order of the president establishing the civilian War Relocation authority to "formulate and carry out a program of a planned and orderly relocation of persons evacuated from military areas." This agency was to select permanent relocation centres where the army would erect temporary wooden barracks for the housing of the evacuated Japanese for the duration. Milton Stover Eisenhower was selected as first director of the War Relocation authority.

The movement of evacuees to the 13 selected reception centres in the four western states began almost immediately, many residents having but two to four days warning of their removal. As many of the Japanese were large property owners, the federal reserve bank, acting as agency for the treasury department, undertook to assist them in disposing of their property. The Farm Security administration and later the War Relocation authority were also vested with some responsibility in this matter but aside from assisting to place non-Japanese operators on vacated farms, delegated their authority to the federal reserve bank in order to avoid conflicting jurisdiction.

The first permanent relocation camp was started on the Colorado River Indian reservation early in April and by the end of the summer ten camps were either completed or nearing completion. These were located at Colorado River and Gila River Indian reservations in Arizona; Manzanar and Tulelake in California; Heart Mountain, Wyo.; Minidoka, Ida.; Granada, Colo.; Central Utah, Utah; and Rohwer and Jerome in Arkansas.

On May 8 the first contingent of evacuees was received at Poston, the new community on the Colorado River Indian reservation which within three months with its 18,000 population became the third largest community in Arizona. In practically every instance the land selected for the relocation centres was under the control of the federal government but was raw land awaiting clearing and irrigation or draining. In every instance communities of from 7,000 to 18,000 people were newly created with all of the problems of construction, sanitation, water supply, light, power, roads, heat, food supply and other community services to be built out of nothing. The initial construction was carried on by the army engineers. Homes were provided in rough wooden buildings 100 ft. long by 20 ft. wide subdivided into four apartments. From five to eight persons were assigned to each apartment. For every 12 such barracks buildings, community kitchens, dining halls, recreation space, toilets, shower baths and laundry were provided. A program of food cultivation first for subsistence and later for war use was announced and factories constructed for the production of camouflage nets and other war products. The organization of community co-operatives for the management of stores and personal services was permitted.

Evacuees were supplied food, housing, medical service and schools. In addition, a clothing allowance was made and a monthly compensation provided of $12, $16, or $19 based on unskilled, skilled or professional labour to those evacuees who engaged in the work program. On May 7 a National Student Relocation council was organized to arrange for as many as possible of the approximately 15,000 evacuees who had been attending colleges or universities to continue their education in colleges outside of the restricted zones. Several hundred students were permitted to continue their education under this plan. Fire protection and internal security are provided by evacuees under non-Japanese supervisors; community government is largely in the hands of Japanese officials elected by adults of the community. Elected positions, however, were limited to citizen Japanese who constituted approximately 35% of the adult group, despite the fact that they amounted to almost 66% of the total. The rest were children under 18. This disfranchisement of the older noncitizens created considerable dissatisfaction among the centre residents.

During the harvest season a number of Japanese labour groups were permitted to accept employment outside of the camps and, after the appointment of Dillon Myer on June 17 as director of the War Relocation authority, succeeding Milton Eisenhower, the announced objective of the War Relocation authority was to find permanent employment outside of the camps for as many of the evacuees as possible. It was pointed out by the agencies connected with the evacuation that there was not and never had been any charges of disloyalty of any kind against the group under the War Relocation authority, that at most they were under protective custody and that the vast majority were considered loyal to the United States.

The anti-Japanese agitation on the Pacific coast flared up on June 26 into a trial in the courts of San Francisco instituted by the Native Sons of the Golden West, a California organization, to bar Japanese-Americans from voting. At the instance of this organization and the western posts of the American Legion and the Veterans of Foreign Wars, legislation was introduced into the 77th congress calling for the revocation of citizenship of persons of Japanese ancestry born in the United States. No action was taken. Several Japanese instituted test suits challenging the right of the government to invade the civil rights of American citizens in the manner carried out by the army and the War Relocation authority.

Only one of these suits reached a tentative decision.

It was held that unusual curfew restrictions could not extend to citizen Japanese.

The Japanese-American Citizens league co-operated closely with the government in urging full conformity to the restrictions imposed and up to Jan. 1943 no suit had been filed challenging the legality of the removal of citizens of Japanese ancestry.

The American Civil Liberties union and other agencies concerned with the rights of citizens evidenced considerable concern for the protection of citizen Japanese in their civil rights.

(W. W. B.)

New Legislation.—During 1942 the following laws affecting aliens were passed by congress:

The act of March 27, 1942, known as the Second War Powers act, provided a simplified procedure for the naturalization of persons in the armed forces during World War II.

The act of April 2, 1942 extended to persons who entered the military or naval service of one of the allies the right of repatriation, the same privilege that persons had who were members of the military or naval services of allies of the U.S. during World War I.

The act of Oct. 9, 1942 amended Section 409 of the Nationality act of 1940. The new act extended to Oct. 14, 1944, the period during which a person would not lose citizenship by living outside the U.S., under the provisions of Sections 404 and 407 of the Nationality act of 1940. (*See* also CENSUS, 1940.) (E. G. H.)

Alimentary System, Disorders of.

The Oesophagus. — Dick and Hurst observed that chronic oesophageal peptic ulcer is a comparatively common disorder with characteristic symptoms and roentgenographic signs. It is generally associated with a congenitally short oesophagus and diaphragmatic hernia of a portion of the stomach, which allows the acid gastric secretion to regurgitate into the oesophagus. Anaemia with dysphagia (Plummer-Vinson syndrome) is the most frequent disorder of the oesophagus in the opinion of Waldenström and Kjellberg. They preferred the term sideropenic dysphagia, because anaemia and achlorhydria are lacking occasionally. These observers described typical roentgenologic changes in the upper part of the oesophagus, observed most clearly or solely on lateral view. A special roentgenologic technique is required.

The Stomach and Duodenum.—Studies by Hay, Varco, Code and Wangensteen showed that prolonged maximal secretion of acid gastric juice as a result of the intramuscular injection of histamine imbedded in beeswax produced gastric and duodenal ulcers with some regularity in a number of common laboratory and domestic animals. Observations by Wolf and Wolff on a patient who had a large gastric fistula led them to conclude that the natural history of peptic ulcer in human beings is directly concerned with emotional conflict involving anxiety, hostility and resentment. This gives rise to accelerated gastric secretion, hypermotility, and hyperaemia and engorgement of the gastric mucosa resembling hypertrophic gastritis. Under such circumstances mucosal erosions and haemorrhages were induced readily by even the most trifling traumas. Prolonged exposure of an erosion to acid gastric juice resulted in the formation of a chronic ulcer.

In a series of observations made on 128 patients who had hiatus oesophageal hernia Jones emphasized features that distinguish the symptoms engendered by such hernias from those due to cardiac disease. He also described the pain mechanism or pathway and expressed the conviction that hiatus hernias have a reasonably characteristic set of symptoms by means of which, under careful observation, the hernias can be diagnosed properly.

Gastroscopic studies of the gastric mucosa of chronic alcoholic addicts by Berry and by Gray and Schindler demonstrated independently the infrequency with which alcohol gives rise to unequivocal chronic gastritis. Benedict stressed the significance of haemorrhage in about a fifth of all cases and varieties of gastritis. Apart from ulcerative gastritis, Palmer minimized the clinical significance of nonspecific chronic superficial, atrophic and hypertrophic forms.

In Black's opinion, the pathogenesis of alimentary azotaemia is as follows: The usual moderate rise of blood urea is accounted for mainly by absorption of nitrogen in large amounts from the blood in the bowel at a time when the kidneys are hampered by a diminished flow of blood. If the haemorrhage is unusually severe, breakdown of tissue proteins becomes important as a source of nitrogen and renal function is further impaired, so that the azotaemia is more pronounced than when haemorrhage is not severe.

The Biliary Tract and Pancreas.—Diagnostic alertness and surgical conservatism continued to be the watchword in acute pancreatitis. Elman urged physicians always to consider the pancreas as a cause of severe pain in the upper part of the abdomen and to resort promptly to the test for serum amylase. Demel observed that even early operation for acute pancreatic necrosis does not arrest the necrotic process, so that many surgeons now adopt a conservative attitude in the presence of this condition. Surgical intervention, however, is warranted under two circumstances: namely, drainage of a pancreatic abscess which may eventually develop, or interval operation for associated demonstrable disease of the gall bladder or extrahepatic biliary ducts, or both.

Intestines.—The diagnostic indications for intubation according to Abbott are aimed at detection of disorders of absorption, minimal lesions ill defined by roentgenoscopy, advanced intestinal obstruction forbidding the use of opaque meals, and rare gastrointestinal disorders unidentifiable by standard methods of study. The intramuscular injection of a combination of gynergen (ergotamine tartrate, 0.25 mg.), prostigmin methylsulphate (0.25 mg.) and solution of posterior pituitary (1.25 units) was recommended by Adler, Atkinson and Ivy in the treatment of postoperative distention. This treatment should not be employed except under the direction of a physician.

(G. B. En.)

Allen, Glover Morrill

(1879–1942), U.S. naturalist, was born February 8 in Walpole, N.H. Dr. Allen was professor of zoology at Harvard and curator of mammals at the university's museum of comparative zoology. A naturalist of national renown, he was a member of many scientific expeditions and was an authority on birds and mammals. He died February 14 at Cambridge, Mass. (See *Encyclopædia Britannica.*)

Allergy.

The subject of air-borne moulds as causes for allergic symptoms was further clarified by two excellent atmospheric surveys. In the study by Morrow and associates of the mould distribution throughout the central and southern U.S.A., alternaria and hormodendrum were found to be the most common. In the south, these two moulds were present uniformly throughout the year, while in the north, high counts reaching numerous peaks were present during the summer and low counts during the winter. A similar but more intensive study over a five-year period of the mould distribution in the Chicago area by Bernstein and Feinberg confirmed the more general study by Morrow and co-workers. Pratt and Crossman investigated the antigenic properties of moulds and found the spores many times more potent than the mycelia.

DUMPING RAGWEED, chief source of hay fever, into incinerators in New York city in Aug. 1942

Two reports, one on the passage of ingested proteins into cow's milk (Rockwell), the other on its transmission through breast milk (Bruner and Baron), may help to explain puzzling instances of allergy in infants whose symptoms appear after the first ingestion of certain foods. In Rockwell's case, a farmer sensitive to alfalfa but not to milk developed asthma after drinking milk from cows fed on alfalfa. Immunization with alfalfa extract resulted in tolerance to such milk. This report suggested the possibility that cottonseed or flaxseed sensitivity may result from minute amounts of these materials passed into the milk. The report by Bruner and Baron that experimentally fed cottonseed meal will pass into human milk, substantiated this possibility.

Refinements in diagnostic measures were added by the following reports: that fruit juices, when freshly expressed, give positive skin reactions in sensitive patients, but lose this property within 24 hours (Tuft and Blumstein); that odours from flowers, plants, chemicals and foods can produce respiratory allergy (Urbach); that direct examination (gastroscopy) of the stomach lining during an attack of gastro-intestinal allergy shows swelling, redness and bumpiness of the mucosa (Pollock and Stuart); that under certain conditions the blood serum of patients with hives caused by sensitivity to light, is capable of transmitting this sensitivity to the skin of normal persons (Rajka). This would indicate the relationship of at least one of the physical allergies with the well recognized group of typical allergic conditions.

Aluminum.

World production of aluminum (or aluminium) was almost doubled by 1943 as a result of war demand, and was increasing heavily. The estimated total for 1941 was 1,045,000 metric tons, as compared with 785,000 tons in 1940, though many of the figures for both years are conjectural. The outputs contributed by the main producers are shown in the accompanying table.

World Production of Aluminum
(Metric tons)

	1937	1938	1939	1940	1941
Canada	42,500	66,000	75,000	95,000	200,000
France	34,500	45,300	50,000	50,000	60,000
Germany	127,500	161,100	200,000	240,000	270,000
Great Britain	19,400	23,300	25,000	32,000	35,000
Italy	22,000	25,800	32,400	36,000	40,000
Japan	10,500	17,000	23,000	32,000	40,000
Norway	23,000	29,000	31,100	20,000	35,000
Switzerland	24,000	27,000	28,000	29,000	28,000
U.S.S.R.	37,700	43,800	50,000	55,000	50,000
United States	133,000	130,400	148,700	187,600	280,000
Others	7,200	10,400	7,400	7,500	6,000
Total	482,300	581,600	672,400	785,000	1,045,000

United States production was advanced by nearly one-half in 1941, to 307,500 short tons, and even greater increases were in store; new plants were constructed, and others were under way, which, when completed, were expected to bring the production capacity up to something like 1,050,000 short tons before the end of 1943. This domestic supply was to be supplemented by imports, chiefly from Canada, to a point where the total supply by the end of 1943 would be approximately equal to world production in 1941.

Three successive drops, each of 1 cent, brought the price down from 20 cents to 17 cents in 1940, and this was reduced to 15 cents in Sept. 1941; no further changes were made in 1942.

Although the three axis countries themselves had 350,000 tons of the 1941 production capacity, controlled by occupation nearly 100,000 tons more in France, Norway and Yugoslavia, and dominated 30,000 tons in Switzerland and Sweden through control of sources of ore supply, the United Nations had a clear supremacy of a full 10%, even after deducting the losses of Russian capacity, and the new plant construction under way was expected to throw the balance heavily in favour of the United Nations. THE WORLD'S LARGEST ALUMINUM ROLLING MILL, at Alcoa, Tenn., went into operation months ahead of schedule in 1942. The photograph shows coils of aluminum after leaving the continuous mill, ready for heat processing

ALUMINUM PRODUCTION OF THE WORLD and the chief producing countries, as compiled by *The Mineral Industry*

Alvear, Marcelo Torcuato de

(1868–1942), Argentine politician and president of Argentina, 1922–28, was born Oct. 4 at Buenos Aires. Exiled in 1931 because of his opposition to government policies, he returned to Buenos Aires in 1933; on his arrival, he was arrested and interned in a concentration camp for alleged participation in a revolutionary plot. After his release, he re-entered the political arena, reorganized the Radical party after President Irigoyen's death and ran, unsuccessfully, for president in 1937. He died in Buenos Aires, March 23. (See *Encyclopædia Britannica.*)

Ambassadors and Envoys.

The following is a list of ambassadors and envoys to and from the United States and to and from Great Britain Jan. 1, 1943.

To and From the United States

(*=ambassadors; unstarred, envoys.)

To the United States	*Country*	*From the United States*
. . . .	Afghanistan	Engert, Cornelius Van H.
*Espil, Felipe A.	Argentina	*Armour, Norman
Dixon, Sir Owen	Australia	Johnson, Nelson T.
*Straten-Ponthoz, Count Robert van der	Belgium	*Biddle, Anthony J. D., Jr.[3]
*Guachalla, Dr. Luis F.	Bolivia	*Boal, Pierre de L.
*Martins, Carlos	Brazil	*Caffery, Jefferson
McCarthy, Leighton	Canada	Moffat, Jay Pierrepont[4]
*Michels, Rodolfo	Chile	*Bowers, Claude G.
*Wei Tao-ming, Dr.	China	*Gauss, Clarence E.
*Vargas Nariño, Alberto[1]	Colombia	*Lane, Arthur Bliss
Fernández, Dr. Luis	Costa Rica	Scotten, Robert M.
*Concheso, Dr. Aurelio F.	Cuba	*Braden, Spruille
Hurban, Vladimír	Czechoslovakia	Biddle, Anthony J. D., Jr.[3]
Kauffmann, Henrik de	Denmark	Atherton, Ray (absent)
Troncoso, Dr. J. M.	Dominican Rep.	Warren, Avra M.
*Alfaro, Capt. Colón E.	Ecuador	*Long, Boaz
Hassan Bey, Mahmoud	Egypt	Kirk, Alexander C.[5]
Brennan, Robert	Eire (Ireland)	Gray, David
Castro, Dr. Hector D.	El Salvador	Frazer, Robert
Kaiv, Johannes[2]	Estonia	. . . . . .
Procopé, Hjalmar J.	Finland	Schoenfeld, H. F. Arthur
*Halifax, Viscount	Great Britain	*Winant, John G.
*Diamantopoulos, Cimon P.	Greece	*Biddle, Anthony J. D., Jr.[3]
Recinos, Dr. Adrian	Guatemala	Des Portes, Fay A.
Liautaud, André	Haiti	White, John C.
Caceres, Dr. Julian R.	Honduras	Erwin, John D.
Thors, Thor	Iceland	Morris, Leland B.
Shayesteh, Mohammed	Iran	Dreyfus, L. G., Jr.
Jawdat, Ali	Iraq	Wilson, Thomas M.
Bilmanis, Dr. Alfred	Latvia	. . . . . .
. . . .	Liberia	Walton, Lester A.
Žadeikis, Povilas	Lithuania	. . . . . .
Le Gallais, Hugues	Luxembourg	Moffat, Jay Pierrepont[4,6]
*Castillo Nájera, Dr. Francisco	Mexico	*Messersmith, George S.
*Loudon, Dr. A.	Netherlands	*Biddle, Anthony J. D., Jr.[3]
Nash, Walter	New Zealand	Hurley, Patrick J.
DeBayle, Dr. León	Nicaragua	Stewart, James B.
*Munthe de Morgenstierne, Wilhelm	Norway	*Biddle, Anthony J. D., Jr.[3]
*Jaén Guardia, Ernesto	Panama	*Wilson, Edwin C.
*Velázquez, Dr. Celso R.	Paraguay	*Frost, Wesley
*Freyre y Santander, Manuel de	Peru	*Norweb, R. Henry
*Ciechanowski, Jan	Poland	*Biddle, Anthony J. D., Jr.[3]
Bianchi, João A. de	Portugal	Fish, Bert
*Cárdenas, Juan F. de	Spain	*Hayes, Carlton J. H.
Boström, W.	Sweden	Johnson, Herschel V.
Bruggmann, Charles	Switzerland	Harrison, Leland
Seni Pramoj, Rajawongse	Thailand	. . . . . .
*Ertegün, Mehmet M.	Turkey	*Steinhardt, Laurence A.
Close, Ralph W.	Union of South Africa	Mac Veagh, Lincoln
*Litvinov, Maxim	U.S.S.R.	Standley, William H.
*Blanco, Dr. Juan C.	Uruguay	*Dawson, William
*Escalante, Dr. Diógenes	Venezuela	*Corrigan, Frank P.
*Fotitch, Constantin	Yugoslavia	*Biddle, Anthony J. D., Jr.[3]

American Academy of Arts and Letters.

The American Academy of Arts and Letters was founded in 1904 by the National Institute of Arts and Letters, in order to make the institute more efficient in carrying out the purposes for which it was organized, namely the protection and furtherance of literature and the fine arts and to give greater definiteness to its work. The membership of the academy is limited to 50, chosen only from the members of the institute.

The 1942 annual meeting of the academy was held on May 8. For the first time the academy participated with the National Institute in a public ceremonial at which new members were inducted and ten $1,000 grants were given. This was followed by the opening of the first comprehensive exhibition of the works of members of both organizations from the departments of art, literature and music, in the art gallery and museum, closing on June 15. It was reopened in October and continued until the end of the year.

The officers of the academy for 1942–43 were: Walter Damrosch, president; James Truslow Adams, chancellor and treasurer; William Lyon Phelps, secretary. The other six directors were Stephen Vincent Benét, Van Wyck Brooks, William Adams Delano, Charles Dana Gibson, Deems Taylor and Chauncey B. Tinker. (F. GN.)

American Academy of Arts and Sciences.

The academy is limited to 800 fellows and 130 foreign honorary members, divided among four classes: mathematical and physical sciences, natural and physiological sciences, the social arts, the humanities. The officers for 1942 were: president, Harlow Shapley; corresponding secretary, Abbott P. Usher; recording secretary, Hudson Hoagland; treasurer, Horace S. Ford. The following papers were presented at the regular monthly meetings: Vladimir K. Zworykin, "The Electron Microscope"; Alfred North Whitehead, "Statesmanship and Specialized Learning"; Igor I. Sikorsky, "On the Air Transportation of the Future"; Walter S. Lemmon, "Radio as a New Force in the Post-War World"; Zechariah Chafee, Jr., "International Utopias"; Clarence F. Jones, "South America and the War"; Samuel Van Valkenberg, "The Importance of the Netherlands East Indies"; Carleton S. Coon, "Systems of Human Relations"; Conrad M. Arensberg, "Nature of World Equilibrium"; Eliot D. Chapple, "How a World Equilibrium Can Be Organized"; A. Warren Stearns, "Psychiatry and the Structure of Society"; Mark Granbard, "Morale for a Democratic Offensive."

The following papers were read by title: P. W. Bridgman, "Pressure-Volume Relations for 17 Elements to 100,000 kg. 1 cm.^{2}"; F. M. Carpenter, "The Lower Permian Insects of Kansas"; P. W. Bridgman, "Freezing Parameters and Compressions of 21 Substances to 50,000 kg. 1 cm.^{2}"; F. R. Hildebrand, "The Approximate Solution of Singular Integral Equations Arising in Engineering Practice"; T. L. Davis and Ch'en Kuo-fu, "The Inner Chapters of Pao-p'u-tzu."

Grants in aid of research were made from the Rumford fund, the C. M. Warren fund and from the Permanent Science fund.

(A. P. U.)

American Academy of Political and Social Science.

On April 10 and 11, 1942, there was held the 46th annual meeting of the academy with the general subject "Winning Both the War and the Peace." Other meetings of 1942 included a session on Feb. 26 addressed by Viscount Halifax, the British ambassador, on the subject "Anglo-American Relations"; a gathering on Nov. 16 on "The Future of Central and Eastern Europe" with addresses by Henryk Strasburger, minister of finance of Poland, Bogoljub Jevtitch, minister of state of Yugoslavia, and others; and a meeting on Nov. 30, addressed by Randolph E. Paul, general counsel of the treasury of the United States, Beardsley Ruml, chairman of the board of the Federal Reserve Bank of New York, and Professor Roswell F. Magill of Columbia university.

During 1942 the six bimonthly issues of *The Annals* had the following titles: "The Press in the Contemporary Scene" (January); "Organizing for Total War" (March); "Administrative Regulation of Private Enterprise" (May); "Winning Both the War and the Peace" (July); "Minority Peoples in a Nation at War" (September); and "Labor Relations and the War" (November). The academy also publishes a pamphlet series; during 1942 there appeared No. 11 entitled "Latin American Viewpoints," and No. 12 entitled "Topical Index to National Constitutions."

Student memberships, offered for the third year in 1942, totalled approximately 350. Under this arrangement students enrolled in educational institutions receive all of the privileges of regular membership at a cost of only $3 per year instead of the usual $5.

The officers for 1942 were: Ernest Minor Patterson, president; J. P. Lichtenberger, secretary; Charles J. Rhoads, treasurer; Thomas S. Hopkins, assistant treasurer; Herbert Hoover, Carl Kelsey and C. A. Dykstra, vice-presidents. Headquarters are at 3457 Walnut St., Philadelphia, Pa.

(E. M. P.)

American Association for the Advancement of Science.

The officers of the American Association for the Advancement of Science for 1942 were: Dr. Arthur H. Compton, Charles H. Swift Distinguished Service professor of physics of the University of Chicago, president; Forest Ray Moulton, permanent secretary; Otis W. Caldwell, general secretary; Charles Carroll Morgan, treasurer; and Sam Woodley, assistant secretary. The retiring president was Irving Langmuir.

The 1942 membership of the association passed 23,500. Its affiliated and associated societies, 186 in number, had a combined membership, including duplicates, of nearly 1,000,000. The association held a meeting in Dallas, Tex., which closed on Jan. 3, 1942, with an estimated attendance of about 4,000. At the Dallas meeting, Dr. A. F. Blakeslee gave his retiring address on the subject, "Individuality and Science." The annual association $1,000 prize was awarded to Drs. Dugald E. S. Brown and Douglas A. Marsland of New York university and Dr. Frank H. Johnson of Princeton university for two joint papers referring to two aspects of the same broad problem, the titles of which are as follows: (1) "The Reversible Denaturation of Enzymes as a Determining Factor in the Reaction of Biological Systems to Temperature and Pressure" and (2) "The Mechanism of Temperature and Hydrostatic Pressure Reversal of Narcosis in Luminous Bacteria." Nine grants-in-aid of research were given. During 1942 four books for the symposia series were published as follows: (1) *Liebig and After Liebig—A Century of Progress in Agricultural Chemistry;* (2) *Aerobiology;* (3) *Relapsing Fever;* and (4) *Fluorine and Dental Health.* One book—*Alcohol Explored*—was published for the non-technical series. In March the association inaugurated another journal, the *A.A.A.S. Bulletin.* This eight-page journal was intended to contain articles and items of timely interest to all members of the association. Subscriptions for it are included in the annual dues of $5. In addition, members receive either the weekly journal *Science* or *The Scientific Monthly* without extra cost.

(F. R. Mo.)

American Bankers Association.

Under the administration of Henry W. Koeneke, president of the Security Bank of Ponca City, Ponca City, Okla., the association devoted a major portion of its efforts towards aiding the government in raising the huge sums necessary to finance the U.S. treasury's war outlay and providing capital for the great expansion of industries as they converted plants and equipment from peace to wartime operation.

In response to the request of government transportation agencies, the association cancelled its annual convention which was to have been held in Detroit, Mich., in Sept. 1942, and substituted in its place a "Convention in Print" which was sent to the A.B.A.'s membership through the medium of *Banking,* official publication of the association, and through other publications. Reports of activities and speeches which would have been given at the convention were thus made available to banks throughout the country.

Officers for the association in 1942–43, inaugurated at a meeting of the association's executive council in New York in Sept. 1942, were: president, W. Linn Hemingway, St. Louis, Mo.; first vice-president, A. L. M. Wiggins, Hartsville, S.C.; treasurer, William F. Augustine, Boston, Mass.; executive manager, Dr. Harold Stonier, New York, N.Y.; secretary, Richard W. Hill, New York, N.Y.; national bank division, president, S. A. Phillips, Louisville, Ky.; savings division, president, W. W. Slocum, Detroit, Mich.; state bank division, president, Frank P. Powers, Mora, Minn.; trust division, president, Louis S. Headley, St. Paul, Minn.; state secretaries section, president, Fred M. Bowman, Topeka, Kan. (L. Gn.)

American Bar Association.

Assistance to U.S. war agencies in specific projects was reported by a special committee composed of Walter P. Armstrong, George Maurice Morris and Thomas B. Gay. This committee announced the co-ordination of committees on war work, civilian defense, bill of rights, international law, administration of justice, public information and U.S. citizenship in a comprehensive program which included continued assistance in the administration of the Selective Service act, issuance of a manual of law for civilian defense officials, maintenance of civil rights, preparing a roster of lawyers available for war service, and the study of postwar law problems. The demand for the "Manual of Law" for the use of Selective Service advisory boards, prepared by the war work committee, required the publication of a second edition. Elected at the 1942 meeting in Detroit were: George Maurice Morris, president; Guy R. Crump, chairman of the house of delegates; Harry S. Knight, secretary; John H. Voorhees, treasurer; Joseph D. Stecher, assistant secretary.

Awards.—The annual medal of the association was awarded to Charles Evans Hughes, retired chief justice of the U.S., for conspicuous service to the cause of American jurisprudence; the Ross prize of $3,000 went to Frank E. Cooper of Detroit, Mich., for an essay on "What Changes in Federal Legislation and Administration Are Desirable in the Field of Labor Relations Law"; awards of merit were given to the state bar of California, the District of Columbia Bar association, the Detroit Bar association, and the Lake County (Ill.) Bar association. (M. Dn.)

American Bible Society.

The 126th annual meeting of the American Bible society was held in May 1942. John T. Manson was president; Gilbert Darlington, treasurer. General secretaries were Rev. Dr. Eric M. North, Rev. Dr. Frederick W. Cropp (on leave), Frank H. Mann, M.A., and Rome A. Betts, M.A. Rev. Dr. Francis C. Stifler was editorial and recording secretary.

The society distributes about 4,000,000 volumes of Scripture annually in the United States. In co-operation with the British and Foreign Bible society, the Scottish Bible society and other missionary organizations, the Scriptures were translated into 1,055 languages up to the end of 1941 and about 21,000,000 volumes were distributed in 1941 throughout the world. (F. C. St.)

American Chemical Society.

The society operates under a national charter from the 75th congress. In 1942 the presidency passed from Dr. William Lloyd Evans of Ohio State university to Dr. Harry N. Holmes of Oberlin college, with Dr. Per K. Frolich of the Standard Oil Development Co. as president-elect. Frolich became president Jan. 1, 1943. National meetings in Memphis and Buffalo showed attendances of 2,324 and 4,288 with 331 and 425 papers, respectively. The 99 local sections were more active than ever. The awards of the society: John Lawrence Oncley, American Chemical society award in pure chemistry; Earl A. Evans, Jr., Eli Lilly and company award; George E. Holm, Borden award; Florence B. Seibert, A.C.S. Women's award (Garvan medal); Webster N. Jones, Pittsburgh award; M. X. Sullivan, Hillebrand award; Arthur B. Lamb, Nichols medal; Lawrence H. Flett, Schoellkopf medal; Thomas Midgley, Jr., Willard Gibbs medal; F. G. Keyes, Theodore William Richards medal. Membership passed 32,000. (C. L. Ps.)

American Citizens Abroad.

The annual statements heretofore released by the department of state showing the number of American citizens residing abroad and giving a summary of certain passport statistics are not available for the information of the general public. (R. B. S.)

American College of Surgeons.

The college was founded in 1913 by 500 surgeons of the United States and Canada, under the leadership of Dr. Franklin H. Martin, to elevate the standards of surgery and to stimulate high professional and ethical ideals. The fellowship for 1943 numbered 13,350; 792 were received into fellowship in 1942. Chairman, board of regents, Dr. Irvin Abell, Louisville, Ky.; president, 1941 until the succeeding presidential meeting (the 1942 clinical congress and inaugural ceremony was cancelled because of the war): Dr. W. Edward Gallie, Toronto, Ont.; president-elect, Dr. Irvin Abell, Louisville, Ky.; treasurer, Dr. Dallas B. Phemister, Chicago, Ill.; secretary, Dr. Frederic A. Besley, Waukegan, Ill.; associate director and chairman, administrative board, Dr. Malcolm T. MacEachern, Chicago, Ill.; associate director, Dr. Bowman C. Crowell, Chicago, Ill.; assistant director, Dr. E. W. Williamson, Chicago, Ill. The organization originated hospital standardization, 1918, formulating minimum standards for approval and starting periodic surveys; 2,989 hospitals in United States, Canada and other countries were on the 1942 approved list; 385 cancer clinics in hospitals and 1,053 medical services in industry were approved in 1942. Hospitals approved for graduate training in surgery and the surgical specialties in 1942 numbered 217. An approved list of medical motion picture films is issued yearly. The college maintains a medical library and literary research department. Committees on cancer, archives of cancer, fractures and other traumas, and the Hall of Art and Science of Surgery function through a department of clinical research. War sessions were held in 1942 in 27 cities throughout the United States, with a combined attendance of nearly 40,000 physicians and medical students, in addition to large numbers of hospital executives. (M. T. M.)

American Dental Association.

The American Dental association, founded in 1859 at Niagara Falls, N.Y., is the second national dental association to be formed in the United States, the first being the American Society of Dental Surgeons, established in 1840 and disbanded in 1856. The Civil War split the American Dental association's membership, and in 1869 the Southern Dental association was organized. In 1897 the two organizations merged to form the National Dental association, which in 1922 adopted the original title, The American Dental association.

The American Dental association is composed of 58 state and territorial societies which in turn are formed of approximately 440 component societies organized in cities, counties and districts. The 56,000 members, through their state and local societies, annually elect their delegates, about 280, who in turn elect the association's president, three vice-presidents, secretary, treasurer and 13 trustees. These officers conduct the business affairs of the association.

The association endeavours to cultivate and promote the art and science of dentistry, to direct and encourage dental research, to improve dental education, to disseminate knowledge of dentistry, and to enlighten and direct public opinion in relation to oral hygiene and the care of the oral cavity.

These duties are performed by the officers and trustees, assisted by standing and special committees, councils and bureaus, chief of which are: judicial council, council on dental therapeutics, council on dental education, research commission, council on dental health, committee on legislation, committee on economics, relief commission and relief fund committee, membership committee, library bureau, bureau of chemistry and bureau of public relations. (H. B. P.)

American Economic Association.

This nation-wide professional organization of economists was founded in 1885 to encourage economic research and stimulate thought and discussion of economic problems. It was composed in 1942 of 3,675 members and 1,220 library, corporate and other subscribers. Publications consisted of a quarterly journal, the *American Economic Review*, the *Proceedings and Papers* of the annual meetings, occasional monographs on special subjects, a *Directory* of its members including classification by fields of specialization and by residence, and an information booklet.

The association is affiliated with the American Council of Learned Societies and the Social Science Research council and has representatives on the National Bureau of Economic Research and certain public advisory bodies. The 55th annual meeting, scheduled to be held in Cleveland Dec. 29–31, 1942, was cancelled by government request but the papers prepared for the occasion were included in the regular volume of the proceedings. The program centred around the economic claims of government and of private enterprise, industrial adjustments at the end of the war, labour problems, price controls and international finance.

Officers for the year 1943: president, Albert Benedict Wolfe, Ohio State university; vice-presidents, William Morris Leiserson, National Labor Relations board; Myron Webster Watkins, United States department of justice; elected members of the executive committee, Corwin D. Edwards, United States department of justice; Carl Sumner Shoup, Columbia university. (J. W. Bl.)

American Federation of Labor.

The American Federation of Labor during 1942 devoted its activities to co-operating with the government in its war effort and extending organization to wage-earners under the American flag so that they might realize economic freedom.

Immediately following the attack on Pearl Harbor and the subsequent declaration of war by the United States, a conference of representative trade union officials met in Washington and pledged full co-operation and support to the government in its war work. Subsequently the federation pledged that its members would purchase at least a thousand million dollars' worth of war bonds and stamps during 1942.

Federation officials early recognized the fact that the workers of America would have a major responsibility in the prosecution of the war in that the material needs of the armed and civilian population of the United Nations would inevitably make unprecedented demands on those engaged in the production field. Every possible effort was made to meet this need. To obtain the highest production level, the wage-earners in many industries lengthened their established work day and work week for the duration of the emergency. As a result, all previous production records were exceeded during 1942 and strikes reduced to a minimum.

The federation anticipated post-war adjustments and urged advance planning so that the transition might take place with minimum hardship for the workers, industry and the public generally. The total dues-paid membership in the American Federation of Labor at the close of its fiscal year on Aug. 31, 1942, was 5,482,581, the highest figure in its history. (*See* also CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES: *Labour*.) (W. G.)

American Geographical Society.

Early in 1942 the American Geographical society published a new three-sheet map on the scale of 1:5,000,000 covering Mexico, Central and South America and the West Indies. This map—a topographical-political map with topography shown by contours and hypsometric tints—was chiefly a reduction of the 107-sheet map of Hispanic America on the scale of 1:1,000,000 which had been one of the society's major projects for 21 years. The map was produced at the request and with the support of the Office of the Coordinator of Inter-American affairs, and, in addition to the English edition, Spanish and Portuguese editions were produced for distribution in Latin America. The society had been long associated with the study of Latin American boundary disputes, and in continuation of that work its department of Hispanic American research, at the request of the department of state, prepared a report on the status of existing survey work along the route of the Ecuador-Peru boundary accompanied by a map compiled from the best available sources for use by the United States commission on the survey and demarcation of the boundary.

In Feb. 1942 a group of experts in various fields met at the society's building under the joint sponsorship of the society and the committee on Latin American studies of the American Council of Learned Societies to discuss plans for an "Atlas of the Americas" which the society contemplated undertaking as a long-range research project.

The society's regular annual book publication was an addition to the Special Publications series entitled *The Face of South America*—a volume of photographs taken from the air by the author, Professor John Lyon Rich of the University of Cincinnati, on a flight around South America by commercial airways, with explanatory text.

In its quarterly journal, *The Geographical Review*, special attention was given during 1942 to articles on the lesser known parts of the world of special interest as the result of World War II. Publication was continued of the *Current Geographical Publications*—a classified list of titles of books, articles, and maps selected monthly for inclusion in the society's research catalogue. (R. R. P.)

American Indians: *see* INDIANS, AMERICAN.

American Iron and Steel Institute.

Virtually all of the activities of the American Iron and Steel institute during 1942 had to do directly or indirectly with the steel industry's contributions to the war effort. Many long-established institute activities, such as the collection of statistical data and the work of technical committees, proved valuable to the various war agencies of the government.

Perhaps the most significant wartime contribution was the announcement of a new family of alloy steels developed at the request of the War Production board by metallurgists comprising the Alloy Steel committee of the institute. These new steels, known as the N.E. (National Emergency) series of steels, contain relatively small amounts of alloying elements yet are thoroughly comparable in performance and usefulness with alloy steels containing higher percentages of alloying elements.

During 1942, the American steel industry for the first time in history faced the threat of a basic raw material shortage. It found itself needing greater tonnages of scrap iron and steel in order to keep up its record-breaking volume of steel production. A nation-wide salvage campaign, supported by the steel industry's contribution of $1,500,000 toward a program of publicity, brought in a substantial quantity of scrap. (W. S. To.)

American Law Institute. Since its organization, the chief work of the American Law institute has been a *Restatement of the Law,* best described as an orderly statement of the common law. While the sections into which the restatement is divided are written in statutory form, they are not presented to legislatures for adoption. The object of the restatement is to clarify and simplify the common law, but not to prevent its continued development by judicial decision. Prior to 1942, 16 volumes of the restatement were published, including the law of contracts, conflict of laws, agency, trusts, restitution, torts and security, besides large portions of the law of property.

During 1942 work on the fourth and fifth volumes of the restatement of the law of property went forward, and the work on a model code of evidence was completed and published. The institute also began work on two matters of importance: (1) an international bill of rights to further education in post-war problems and for possible use in the post-war settlement; (2) a code of commercial law.

The American Law institute was organized in Feb. 1923. Its object is to carry on constructive scientific work for the improvement of the law. Aside from the official members, who are those holding the leading judicial, bar and law school faculty positions, there are 825 life members, membership being a distinct professional honour. The governing body is a council of 33. The members meet each year in Washington, D.C. All legal and other official publications of the institute must be first approved by the council and by a meeting of members. The president in 1942 was George Wharton Pepper; William Draper Lewis was director and chief of the editorial staff. The executive office was in 1942 at 3400 Chestnut Street, Philadelphia, Pa. (W. D. L.)

American Legion. An organization of American veterans of both World Wars I and II. It was originally chartered as a World War I veterans' organization by congress in 1919. It became a two-war organization Oct. 29, 1942, when President Roosevelt signed Public Act 767, making honorably discharged veterans of World War II eligible for membership. The congressional amending of the 1919 charter was authorized by the 24th national convention in Kansas City, Mo., Sept. 19–21, 1942.

The accomplishments of the American Legion in 1942 included: (1) producing 350,000 graduates from its air-raid warden schools for the civilian defense program; (2) selling more than $100,000,000 worth of war bonds and stamps in its nation-wide sales campaign; (3) training thousands of instructors in special legion schools for teaching military drill to students in secondary schools under the U.S. victory corps high school program; (4) obtaining 242,312 recruits for the navy, 93,208 for the army, 6,368 for the marine corps, 2,396 for the coast guard, 8,009 for the state guards, 568 for the merchant marine and 5,943 as air cadets; and (5) defining the nation's war aims to be, First, to win the war; Second, to win the peace; and Third, to preserve the U.S. form of government.

Other 1942 achievements were: (1) operations of 2,370 aircraft warning posts by 2,017 posts in the danger zones, at an annual cost to them of more than $112,000; (2) enrolment of approximately 100,000 legionaries in the aircraft warning systems, 337,941 legionaries as air-raid wardens, 272,306 as volunteer policemen, 34,132 as volunteer firemen, 330,456 as first-aid workers, 3,570 as members of ration boards, 9,671 as members of draft boards and 812 in the civil air patrol; (3) contributions of 63,493 pints of blood by 47,660 legionaries to blood banks; (4) participation of some 172,465 legionaries in nation-wide scrap metal and rubber collections, including collection of more than 10,000,000 old phonograph records which were sold to raise funds for new records that were sent to all U.S. units serving overseas; (5) collection through its fun and honour society, the Forty and Eight, of more than 200,000 decks of playing cards for fighting men in overseas service; (6) distribution of more than 1,500,000 copies of "Fall In," the American Legion's booklet of advice, to men going into the nation's war service; and (7) active co-operation of more than 75,000 key legionaries with the Federal Bureau of Investigation against all espionage, sabotage and fifth column activities.

While the American Legion during 1942 subordinated all its activities to the war effort, it also (1) sponsored more than 3,000 Boy Scout troops; (2) expended the known total of $2,769,440.33 in emergency financial aid to 550,668 needy children, mostly for food, clothing and medical treatment; (3) recovered through its national rehabilitation committee $2,760,862.87 in various contested government benefits for thousands of World Wars I and II veterans and their dependents, without any cost to these beneficiaries; (4) enrolled more than 500,000 boys under 17 years of age in its annual junior baseball program; (5) sponsored another national high school oratorical contest on the U.S. constitution and Bill of Rights, in which 120,000 students in 47 states participated; (6) conducted 29 Boys' States in which more than 12,000 boys selected for leadership qualities received training in civic government; (7) awarded more than 12,317 medals through its posts and auxiliary units to public school pupils outstanding in scholarship and leadership qualities; (8) held its second annual, nation-wide safe driving contest in which more than 9,000 drivers entered; and (9) distributed more than 60,000 copies of a new pamphlet entitled "Know Your America."

All membership records of the American Legion again were broken during 1942. On Dec. 31, 1942, a new all-time high enrolment record of 1,136,148 members was reached. At the same time the number of posts rose to a new high of 11,834. The American Legion auxiliary for the seventh consecutive year also set a new high for membership, reaching a peak of 537,421 divided among 9,382 units, also a new high. The Sons of the American Legion closed the year with an enrolment of 38,862 members in 3,468 squadrons. The Forty and Eight membership rolled to a new high of 46,146 in 714 voitures. The Eight and Forty also broke all former records with a membership of 8,118 in 289 salons.

At the annual national convention Roane Waring, Memphis, Tenn., attorney, was elected national commander. (R. Wg.)

American Library Association. The official organization in the United States and Canada of librarians and others interested in libraries. Founded in 1876, the American Library association is the oldest and largest organization of its kind in the world and during 1942 had about 16,000 members from all continents. Keyes D. Metcalf, Harvard university library, was president for 1942–43.

Work.—The work of the A.L.A. is carried on by its officers; by more than 80 committees and boards of volunteer workers, covering such fields as federal and international relations, war information and education, postwar planning, and general library activities; and by a staff of 84 members. The address of A.L.A. headquarters is 520 North Michigan avenue, Chicago.

Objectives.—Complete and adequate library coverage for the

United States and Canada is one of the chief objectives. During 1942 a recount based on the 1940 census showed that 27% of the population of the United States (35,000,000 persons) is without library service as compared with 34% in 1938. Other objectives are to raise standards of library service and training, to improve the status of the profession, and to integrate its interests with those of the federal and local governments.

Income.—The association's income in 1941–42 (excluding cash balances on Sept. 1, 1941) was $554,800. Income from membership dues, conference, sale of publications, advertising, subscriptions, etc. was about $193,800; $278,000 came from outside sources in the form of grants for special purposes, and $83,000 was endowment income. The association's endowment is approximately $2,137,000.

Annual Conference.—"Winning the War and the Peace: How Libraries Can Help" was the theme of the 64th annual A.L.A. conference held June 22–27, 1942 in Milwaukee, Wis., and attended by more than 2,300 persons from every state in the union, six Canadian provinces, seven Latin-American republics and England. The annual Newbery medal was presented to Walter Dumaux Edmonds for his children's book, *The Matchlock Gun,* and the annual Caldecott medal to Robert McCloskey for his picture book, *Make Way for Ducklings.* James Oliver Modisette of Baton Rouge, La., was cited posthumously for his service to libraries, both as a library trustee and chairman of the Louisiana state library commission. Honorary A.L.A. membership was conferred on Frederick P. Keppel and Theodore S. Chapman for outstanding services to libraries. Officers of the newly formed Canadian Library council and the Council of National Library Associations of the United States and Canada, reported on progress in organization and planning.

War Activities.—An A.L.A. war policy statement urged "that every library give the greatest possible emphasis for the duration of the war to those materials and services which will give people the facts and ideas that will enable them to make intelligent decisions" on the issues involved in winning the war, planning for postwar America, and planning for the postwar world. A series of reports were made on a survey of war activities in public libraries and similar surveys were being considered for school, college and university libraries. Instead of the annual Midwinter conference a National Library institute on war and postwar problems was conducted in Chicago, Jan. 30–31, 1943, followed by similar regional and local institutes. At the suggestion of A.L.A., a librarian was appointed to the staff of the Office of War Information, as chief of the Library Liaison section. During the year 1942, more than 12,000,000 volumes were collected through the Victory Book campaign, which was expected to be augmented by a second campaign opening early in 1943. Close co-operation between the A.L.A. and various governmental departments and bureaus was maintained and some 4,000 libraries were receiving government publications on war-related subjects. A report on postwar planning covering standards for public libraries was made at the request of the National Resources Planning board. As a member of the U.S. office of education wartime commission, the executive secretary of A.L.A. participated in its activities, including studies of the probable shortage of school, college and library personnel. A shortage in professional librarians was expected to total about 1,200 by 1943. Many changes were being made in the programs and schedules of library school curricula to accelerate the preparation of new librarians under emergency conditions without lowering standards. The A.L.A. also issued numerous booklists, pamphlets and bulletins on war-related subjects in addition to publishing similar material in its six periodicals—*A.L.A. Bulletin, Booklist, College and Research Libraries, Journal of Documentary Reproduction, Hospital Book Guide* and *Subscription Books Bulletin.* Libraries were maintaining war information centres; supplying vocational and technical materials to war industries and workers; disseminating authentic information in the fields of history, economics, government and international relations; making available valid interpretations of the war's causes and aims; helping people to participate in postwar planning; and supplying recreational reading to relieve the strains of war.

International activities.—Projects in which the A.L.A. assisted were: the establishment of the Benjamin Franklin library at Mexico City; the conduct of a short library school in Bogotá, Colombia; the inauguration of a Books for Latin America project for supplying books by United States authors to Latin-American libraries; and the collection of scholarly journals for postwar shipment to libraries outside the U.S. During 1942 all international activities of the A.L.A. were co-ordinated under the newly created Board on International Cultural Relations. (M. O. P.)

American Literature.

Beyond the expected increase in war books of different varieties, 1942 did not differ to any noticeable degree from 1941 so far as tendencies in American literature were concerned. Of 100 novels worthy of consideration, more than a third dealt with historical subjects, and this was the only noticeable drift in fiction. Fewer and better books on South America made their appearance, the average output of poetry was below that of 1941 in quality, history and biography more or less held to the average, and aside from another expected increase in scientific books more or less relating to the war effort, the year was not unusual. Interest was strongly maintained in regions, rivers, ports and cities of the U.S.

Among the most noteworthy publications in a variety of fields may be mentioned Esther Forbes's *Paul Revere and the World He Lived In,* in which a distinguished novelist turned to the recreation of revolutionary Boston and vicinity with conspicuous success; Karl Schriftgiesser's *The Amazing Roosevelt Family, 1613–1942,* the whole history of the Roosevelts in the United States; Robert D. Feild's *The Art of Walt Disney,* which was more important for its significance than for its intrinsic quality, but which at least gave Mr. Disney the respect his great art deserved; Charles Morrow Wilson's *Ambassadors in White,* the story of tropical medicine, with strong bearing on Pan-American relations and a stirring account of scientific heroism. The most notable book of verse of the year was Robert Frost's *A Witness Tree,* in which Mr. Frost, passing 65, showed himself still master of his individual idiom.

Herbert Agar sounded a clarion call to his country in *A Time for Greatness,* an appeal for moral as well as physical heroism in this time of crisis and in the postwar period, and H. L. Mencken gave us a magnificent contribution to the art of quotation in *A New Dictionary of Quotations,* containing 1,000,000 words and 33,000 quotations. Marjorie Rawlings' *Cross Creek,* a collection of factual tales about her Florida friends, anecdotal and amusing, almost matched *The Yearling* in popularity, and among other miscellaneous books of lasting value was Lucy Salamanca's *Fortress of Freedom,* the story of the Library of Congress, with a foreword by Archibald MacLeish, librarian of Congress. Major Alexander P. de Seversky's *Victory Through Air Power* maintained categorically that with enough airplanes and men to fly them, the United Nations could win the war.

One of the most widely read books of the year was Joseph E. Davies' *Mission to Moscow,* a readable and valuable report on Russian affairs by the former ambassador. Willard Kiplinger's candid camera portrait, *Washington Is Like That,* the capital as it was in the midst of another war, was widely read and liked.

The War.—There were also many books on how to be a soldier, an art which some 5,000,000 young men were learning. There were a number of books on airplanes and their importance, in addition to the de Seversky volume already mentioned, among them *Parachutes* by Herbert S. Zim, which explained that America's own Billy Mitchell trained parachute troops in 1928, long before Russia or Germany had ever thought of such a thing. A biography of General Mitchell, *Billy Mitchell,* by Lester Cohen and Emile Gauvreau, reviewed the whole sad story of a man ahead of his times. Russell Whelan told the story of U.S. fighters against the Japanese in aid of China in *The Flying Tigers.* Naval strategy was discussed in *Admiral Sims and the Modern American Navy* by Elting E. Morison, a good biography, among its other merits, and naval action in *North Atlantic Patrol* by Lieutenant Commander Griffith Baily Coale, a seagoing artist who came home with many good paintings; while modern conceptions of ocean fighting were considered in Bernard Brodie's excellent *Sea-Power in the Machine Age.*

In war books, the Pacific area, where until the beginning of the campaign in North Africa U.S. efforts were concentrated, came in for the larger share of attention. There were such general books as *How War Came: An American White Paper; from the Fall of France to Pearl Harbor* by Forrest Davis and Ernest K. Lindley, a complete record of world-shaking events; *December 7, The First 30 Hours,* by the correspondents of *Life, Time* and *Fortune* and *The Face of the War, 1931–1942,* by Samuel H. Cuff, which with many maps gave a rounded story of the whole matter and proved to be an invaluable reference book. There were many excellent books on Japan by informed observers, such as Willard Price's *Japan Rides the Tiger,* Helen Mears's *The Year of the Wild Boar;* and *The Setting Sun of Japan* by Carl Randau and Leane Zugsmith, all balanced and fair accounts of the Japanese and their great adventure. Another valuable book of this kind was Frederick Moore's *With Japan's Leaders,* studies of outstanding Nipponese by the former adviser to the Japanese embassy in Washington. There were other excellent books covering larger aspects of affairs in the Pacific, such as Nathaniel Peffer's *What We Fight for in the Pacific,* the book of an "old China hand," and exceptionally valuable; *America in the New Pacific* by George E. Taylor, which looks into the future as well as the immediate past; *Ramparts of the Pacific* by Hallett Abend, a veteran correspondent in the East; and *The Ageless Indies* by Raymond Kennedy, which praised the Dutch as colonists and supplied a wealth of facts.

Clinton Hartley Grattan, who for years had been writing about Australia, presented the island continent anew in *Introducing Australia,* while Jean Potter performed a similar service in *Alaska under Arms.* There were several good books about the Philippines, and some other excellent ones about the heroism of U.S. soldiers who defended the islands. *Crisis in the Philippines* by Catherine Porter, revised and amplified in view of recent events and published by the Institute of Pacific Relations, was one of the best of these, and others of value included Joseph Ralston Hayden's *The Philippines,* written by one of the great living experts on the subject. Books dealing with the war in the island area numbered William Lindsay White's *They Were Expendable,* the thrilling story of the famous PT boats and their remarkable work, and John Hersey's *Men on Bataan,* a heroic chapter of U.S. national history that deserves to live. *Queen of the Flat Tops: U.S.S. "Lexington" and the Coral Sea Battle* by Stanley Johnston, was a saga of modern sea fighting told by an eye-witness, and Cecil Brown's *Suez to Singapore* was another first-hand account of such matters as the sinking of the "Prince of Wales" and the "Repulse." *The Raft* by Robert Trumbull, as told by Harold Dixon, told the curious tale of how three aviators lived for more than a month on a rubber boat in the Pacific.

Escaped correspondents like Wallace Deuel told of life in Germany in such books as *People under Hitler,* and Howard K. Smith described similar scenes in *Last Train from Berlin.* Ben Lucien Burman wrote of the thrilling deeds of the Fighting French in *Miracle on the Congo;* Wallace Carroll argued for Russia in *We're in This with Russia;* Robert L. Baker described the near eastern scene in *Oil, Blood and Sand;* and Elliot Paul, who wrote a classic in *The Life and Death of a Spanish Town,* produced a reminiscent book called

ALEXANDER DE SEVERSKY'S best-selling *Victory Through Air Power* was made the basis for a full-length film in 1942 by Walt Disney, shown (right) conferring with Seversky (left)

The Last Time I Saw Paris, which was interesting enough but not up to the earlier story of the island of Ibiza and the Spanish revolution. Russell Hill's *Desert War* was a vivid account of the fighting in and around Libya by one who was there.

Fiction.—Of novels by established authors the year produced only a moderate quantity. One of the best of these was James Gould Cozzens' *The Just and the Unjust,* in which a distinguished writer of a many-faceted talent examined the workings of the U.S. legal system in a small town with care and interest, producing one of his finest works. Louis Bromfield's *Until the Day Break,* a story of occupied Paris, was widely popular and one of the better of the later Bromfield books, although not within range, for merit, of his early American novels. John Steinbeck's best-seller, *The Moon Is Down,* a story of moral resistance to invading Germany, showed Mr. Steinbeck's cleverness and versatility but was a minor effort. Nancy Hale's *The Prodigal Women* was a sharp analysis of the feminine soul by one of the most noted short story writers of the day, and Eudora Welty produced a medium-length fantasy of merit in *The Robber Bridegroom,* her first venture into longer fiction. In 1942, Miss Welty, who in 1941 won second prize in the O. Henry Memorial prize short story contest, came first with *The Wide Net,* and the other prizes went to Wallace Stegner, Wilbur Schramm and Jeanne Eaton, Miss Eaton winning the special prize for a first published story. The 1942 O. Henry volume, edited by Herschel Brickell, contained 21 stories, one of the best of them being Miss Hale's *Summer—1913.* The 1942 edition of Edward J. O'Brien's *Best Short Stories,* edited by Martha Foley, also was excellent.

Of the usual flood of historical novels, many about the Revolutionary and Civil wars, one of the best was Howard Fast's *The Unvanquished,* which had George Washington for its central figure. Elizabeth Pickett Chevalier's *Drivin' Woman,* a southern story with an appealing heroine, was popular, although not of any special literary merit, and LeGrand Cannon, Jr.'s *Look to the Mountain,* a story of New Hampshire in the early days of the nation, was one of the surprise novels of the season, well conceived and strikingly well written. Other novels of past times included Philip Van Doren Stern's *The Drums of Morning,* a Civil War story from the abolitionist angle by a sound historian of the period; Oscar Lewis' *I Remember Christine,* a story of California in an earlier day; Laura Benét's *Come Slowly, Eden,* a story centring about Emily Dickinson, delicately and freshly told; James Street's *Tap Roots,* a novel of a county in Mississippi, Jones, which refused to secede during the Civil War, full of colour and vigorous action; and Vivien R. Bretherton's *The Rock and the Wind,* a well done story of the Pacific northwest.

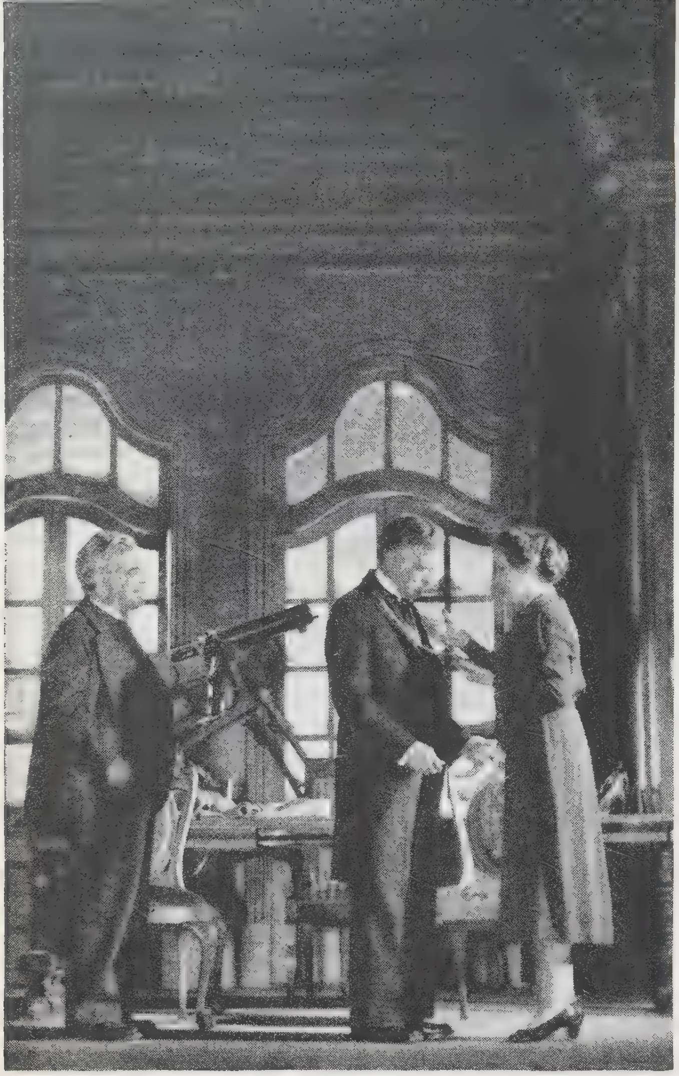
The war invaded the fiction field in unmistakable fashion, one of the most popular books of the year being a piece of humour by a soldier, *See Here, Private Hargrove.* The author's name is Marion Hargrove, and the book may be taken for autobiography. Other books on the subject were more serious and included two about Norway, the scene of Mr. Steinbeck's *The Moon Is Down.* One of these was Elliott Arnold's *The Commandos,* the description of a raid, and the other *The Edge of Darkness* by William Woods, which many reviewers considered superior to the Steinbeck book, on more or less the same subject. James Aldridge's *Signed With Their Honour* was filled with vivid descriptions of air battles, and Howard Hunt's *East of Farewell,* one of the notable first novels of the year, told of the North Atlantic patrol.

Other novels of the year that were outstanding included Austin Tappan Wright's fantasy, *Islandia,* which created a land and peopled it; Rachel Field's *And Now Tomorrow,* a curiously significant title for this author's last book before her death, and an excellent story of logging on Georgia's rivers; Brainard Cheney's *River Rogue,* an account of life in a little known region; William Bradford Huie's *Mud on the Stars,* the autobiographical story of a southern boy which was topical, since it dealt with the war, and was one of the striking first novels of the year; Alice Tisdale Hobart's *The Cup and the Sword,* a story of vintners in the American west, and worth reading; and Dawn Powell's *A Time to be Born,* a savage satire on writers and their world. Granville Hicks wandered back from communism to democracy in *Only One Storm,* and Marcia Davenport, who wrote *Of Lena Geyer* and an excellent life of Mozart, produced *The Valley of Decision,* a long novel of seven decades of American life, centring around one woman. Upton Sinclair completed his trilogy, of which *World's End* and *Between Worlds* had already appeared, with *Dragon's Teeth,* no less readable than its predecessors. The publication of a collection of short stories of South American tales called *Fiesta in November,* edited by Dudley Poore and Angel Flores, with an introduction by Katherine Anne Porter, was a genuine gesture of Pan-American amity.

The American Scene.—The year saw many interesting additions to series dealing with rivers, regions, ports and inland cities. A new series of informal biographies of the states was started with studies of *Georgia: The Unfinished State* by Hal Steed and *Desert Challenge; an interpretation of Nevada* by Richard G. Lillard. Other states which received attention were California in *Thirty-First Star,* by James A. B. Scherer, a story told in terms of leading figures; Washington in *The Roaring Land* by Archie Binns; *Texas; A World in Itself* by George Sessions Perry; and *Virginia Is a State of Mind* by Virginia Moore. The whole country was covered in beautiful photographs chosen by Samuel Chamberlain, the title of the collection being *Fair Is Our Land* (*The Portrait of America*), with an introduction by Donald Moffat. The excellent *Rivers of America* series, started by the late Constance Lindsay Skinner and carried on by Stephen Vincent Benét and Carl Carmer, added *The Sangamon* by Edgar Lee Masters, *The Allegheny* by Frederick Way, and *The Kentucky* by Thomas D. Clark. Walter Havighurst told the story of shipping on the Great Lakes in *The Long Ships Passing,* Karl Bickel explored west Florida in *The Mangrove Coast,* Hulbert Footner wrote lovingly of Maryland in *Maryland Main and the Eastern Shore;* Harold Sinclair did one of the outstanding jobs of the year in *The Port of New Orleans,* another book in a series already well established, and Provincetown found an affectionate chronicler in Mary Heaton Vorse, the book being called *Time and the Town.*

Other books of this variety ranged from a six-volume encyclopaedic study of one town, called *Yankee City,* edited by W. Lloyd Warner and Paul S. Lunt, done with a microscope, to Eric Thane's *High Border Country,* about the wide open spaces of Montana, the Dakotas, Wyoming and Idaho and filled with tall tales. The Folkway series edited by Erskine Caldwell, which got under way in 1941, added *Mormon Country* by Wallace Stegner, *Blue Ridge Country* by Jean Thomas and *Ozark Country* by Otto Ernest Rayburn, all excellent studies. Philip Ainsworth Means examined a famous monument in *Newport Tower.* Ben Robertson wrote eloquently and affectionately of western South Carolina in *Red Hills and Cotton;* Marion Nicholl Rawson added another volume of Americana in *New Hampshire Borns a Town, 1753–1853;* and Herbert Asbury wrote about oil in *The Golden Flood,* the story of the early days of black gold in western Pennsylvania.

South America.—Interest in the United States's southerly neighbours did not slacken in 1942, but there was a refreshing change in the general quality of the books on the subject. There were far fewer volumes by fast-flying journalists, otherwise known as parachutists, and far more by informed students of the subject. Brazil received most attention, with two studies centring about the nation's ruler: Karl Loewenstein's *Brazil under Vargas*



THE MOON IS DOWN, by John Steinbeck, was released simultaneously as a novel and as a play in 1942. In his story about the invasion of a small country (the resemblance to Norway is unmistakable), Steinbeck attempted to prove that it is impossible "to break a man's spirit . . . permanently." This scene from the play shows the heroic mayor (centre) of a town in the invaded country, with his wife and a friend

and Paul Frischauer's *A Biography of President Vargas,* both well done; Vera Kelsey's *Brazil in Capitals,* the account of 28 provincial capitals, carefully and accurately written; *Frontier by Air* (*Brazil Takes the Sky Road*) by Alice Rogers Hager, an account of the wonderful development of aviation in a country where the aeroplane is of supreme usefulness; and Donald Pierson's *Negroes in Brazil,* an absorbing study of the race situation in a country where prejudice is unknown and people of mixed blood are often preferred.

Of books on individual countries, John W. White's *Argentina* was the most important because of the great strategic importance of the largest of the Spanish-speaking countries in South America. Mr. White lived in the country as a newspaper correspondent for many years and is a careful, conscientious student of history and current affairs. Of general books, Preston James's *Latin America,* written from the point of view of the economic geographer, but readable as well as strikingly complete and accurate, was one of the best, and with it went Dana Gardner Munro's *The Latin American Republics,* perhaps the best one-volume history available in 1942. Paul Radin's *Indians of South America* covered a highly important subject creditably, and the veteran traveler Harry A. Franck, with the aid of Herbert C. Lanks, turned in an up-to-date account of a significant development in *By Pan-American Highway through South America,* 13,000 miles by what will be one of the most vital highways in the world. There are many good photographs in this timely volume. Thomas Harper Goodspeed's *Plant Hunters in the Andes* was a popular account of a notable botanical expedition, and the West Indies came in for their share of attention in Walter Adolphe Roberts' *The French in the West Indies* and Amy Oakley's *Behold the West Indies,* with illustrations by Thornton Oakley, both books of merit. Hoffman Birney retold the stirring story of the four Pizarro brothers, those most extraordinary of conquistadores, in a sound historical novel, *Brothers of Doom,* and in *The Days of Ofelia* Gertrude Diamant captured much of the irresistible charm of Mexico and the Mexicans. *The Panama Canal in Peace and War* by Norman J. Padelford was particularly timely.

Biography and Autobiography.—The momentary importance of Alaska in allied strategy gave special interest to Hector Chevigny's *Lord of Alaska,* the story of Baranov, that remarkable Russian who may rightly be called the father of the great land which was once known as "Seward's folly." The Civil War period engaged the attention of biographers as much as it did of historians, and Douglas Southall Freeman produced the first of three large volumes on *Lee's Lieutenants.* Vol. 1 covered the period from Manassas to Malvern Hill and touched on Beauregard, Johnston, Magruder, Garnett, Ewell, Stuart and Jackson, making the beginning of a set to go on the shelf with Dr. Freeman's definitive *Robert E. Lee.* John C. Pemberton, with the help of Dr. Freeman's introduction, tried to present a fair picture of the Philadelphia Quaker who commanded the southern troops at Vicksburg in a book called simply *Pemberton;* and William E. Brooks, author of *Lee of Virginia,* produced a good biography on the other side, with *Grant of Appomattox.*

Samuel Eliot Morison wrote a sailor's book about a sailor in *Admiral of the Ocean Sea: A Life of Christopher Columbus,* also published in a one-volume edition for popular consumption, which was a real contribution to a baffling subject, while there were two notable additions to recent studies of the men who built America's great fortunes, Wheaton J. Lane's *Commodore Vanderbilt; An Epic of the Steam Age,* and John K. Winkler's *Tobacco Tycoon,* the story of James B. Duke. Twenty-eight noted contemporary writers produced *There Were Giants in the Land,* 28 studies of great men, introduced by Henry Morgenthau, Jr.; Hendrik Van Loon filled a fat volume with short biographies of striking figures from the ages, called simply *Lives;* Saul K. Padover was the author of *Jefferson,* one of the finest of all the biographies of the noble Virginian; Harold B. Hinton did a portrait of a distinguished living statesman in *Cordell Hull,* with a foreword by Sumner Welles; and J. Brett Langstaff brought to life a famous doctor in *Doctor Bard of Hyde Park,* a study of revolutionary times in New York state and of an extraordinary individual.

Literary life stories included Sherwood Anderson's *Memoirs,* the final autobiography of a man who wrote many autobiographies; *Whittier: Bard of Freedom* by Whitman Bennet; and *The Life of Margaret Fuller* by Madeleine B. Stern. Matthew Josephson's *Victor Hugo* was a fine contribution of American scholarship to the study of an international figure.

History.—The Civil War and Abraham Lincoln were the two subjects that received the largest share of attention from the historians, and on the first subject the important books were Avery Craven's *The Coming of the Civil War,* a southern historian's documented arguments against the irrepressibility of the conflict; Wood Gray's *The Hidden Civil War: The Story of the Copperheads,* a striking illustration of the lack of national unity in the fatal sixties; and *Storm over the Land: A Profile of the Civil War,* made up of selections from Carl Sandburg's monumental life of Lincoln which relate directly to the war. The Lincoln books included *Lincoln and His Party in the Secession Crisis* by David M. Potter, a study of the Republican party between the election in 1860 and the outbreak of armed conflict in April 1861;

Abraham Lincoln and the Fifth Column by George Fort Milton, an account of plots all over the union to destroy it with uprisings; and *Lincoln among His Friends,* assembled by Rufus Rockwell Wilson—51 first-hand accounts of the liberator by people who actually knew him. The outstanding work of American history, however, was Thomas Jefferson Wertenbaker's *The Old South; The Founding of American Civilization,* a realistic and well done volume in a series which began with an admirable study of the middle colonies. Charles A. and Mary Beard tried to explain the nation with *The American Spirit,* made up of quotations from the leaders of the past and present, which showed that the United States had proceeded from the certainty of the earlier period to a time of doubt, hesitation and uncertainty in the later.

Belles Lettres.—Ferner Nuhn and Maxwell Geismar made important contributions to certain aspects of national culture, the first with *The Wind Blew from the East,* subtitled "A Study in the Orientation of American Culture," and mostly concerned with writers strongly under European influences, which will eventually be a trilogy on this subject, and the second with *Writers in Crisis,* an attempt to show the return to faith of Hemingway, Dos Passos and Steinbeck after a period of pessimism and doubt. The thesis itself was laboured and not proved, but there were highly stimulating studies of the writers mentioned, as well as Faulkner, Lardner, Wolfe, MacLeish and others.

Allen Tate and John Peale Bishop edited a large anthology called *American Harvest: Twenty Years of Creative Writing in the United States* and did not give their own group, especially in the south, the worst of it from the point of view of selection, while Bernard DeVoto continued to explore Twainiana, with *Mark Twain at Work,* notebooks on Tom Sawyer and Huckleberry Finn. E. B. White's collection of essays, *One Man's Meat,* proved again that White is one of the most original thinkers of the day.

Poetry.—The year produced only a handful of volumes of poetry of enduring importance, in addition to Robert Frost's contribution. Carl Sandburg's *Smoke and Steel, Slabs of the Sunburnt West* and *Good Morning, America* were collected into a single volume; Lew Sarett's *Collected Poems* also appeared; Genevieve Taggard proved a somewhat difficult singer in *Long View,* although still of obvious talent; and Hans Zinsser, author of *Rats, Lice and Men* and *As I Remember Him* revealed another side of a gifted man of science and writer in a fine volume of poems, *Spring, Summer and Autumn.* Arthur Davison Ficke's sonnets in *Tumultuous Shore and Other Poems* were of high quality, while Rolfe Humphries' *Out of the Jewel* spoke in original tones and manifested a striking mastery of technique. The war provoked Muriel Rukeyser's *Wake Island* and Mark Van Doren's *Our Lady Peace,* while Stephen Vincent Benét's radio play, *They Burned the Books,* was another powerful piece of propaganda against the dictators. (H. BL.)

American Medical Association.

In 1942 the American Medical association had more than 121,000 members out of about 152,000 doctors practicing medicine in the United States, and 180,000 licensed to practice. The annual meeting of the house of delegates in 1942 was in Atlantic City. The 1943 meeting, scheduled for San Francisco, was cancelled, but the house of delegates was to meet in Chicago in June 1943. The association had a gross income of approximately $2,000,000 annually. It is incorporated not for profit.

The association actively participated in the war effort in 1942 through its committee on war participation and through the publication of a periodical called *War Medicine.* In the headquarters office of the association a suboffice of the War Manpower commission was established, charged with aiding in the procurement and assignment of physicians for the army and navy, and the public health service, industrial medicine and the civilian population.

The headquarters office is located at 535 North Dearborn st., Chicago, Ill. The association publishes the *Journal of the American Medical Association,* with a circulation of 105,000 weekly; *Hygeia,* with a circulation of more than 125,000 monthly, and other medical journals in each of the medical specialties. The association also publishes the *Quarterly Cumulative Index Medicus,* which indexes regularly the contents of 1,400 medical periodicals, and a directory of all U.S. physicians. At the end of 1942 the association began distribution of a fortnightly letter to the army and navy, the public health service and all medical officers, to keep them abreast of progress in medical science.

The library of the American Medical association conducts a package library service, sending packages of articles and reprints to physicians throughout the nation to aid them in keeping themselves up-to-date on subjects of interest and importance in medical advancement. Particularly requested during 1942 were articles on the sulphonamide drugs, industrial diseases, anaesthesia, vitamins, tuberculosis, the war, national defense problems and aviation medicine.

The council on pharmacy and chemistry of the American Medical association standardizes drugs sold only on prescription, and reports on all new advances in the field of drugs. Reports in 1942 included bacteriophage therapy, human blood plasma and serum, glandular products and vitamins.

The council on physical therapy gave special attention in 1942 to apparatus for artificial respiration, audiometers and hearing aids. The council on foods and nutrition was exceedingly active in the improvement of foods by restoration of important vitamins and minerals and in the consideration of vitamin products.

The council on industrial health investigates industrial health services, standardizes industrial health organizations, and advises on all health problems in industry. The bureau on health education conducts radio programs and circulates thousands of pamphlets on health subjects. The bureau of legal medicine and legislation is concerned with standards of proposed federal and state legislation in the field of health. The bureau on medical economics makes available complete data on the economics in medical practice, carrying on constantly studies of the distribution of physicians, prepayment medical service plans, and similar projects. The bureau of investigation is charged with studies of quackery and nostrums. The bureau of exhibits provides exhibits for state and county medical societies, national medical associations, and many public agencies.

Amulree, William Warrender Mackenzie,

1ST BARON (1860–1942), British lawyer and labour mediator, was born August 19 near Perth, Scotland. He attended Edinburgh university and University college, London, and was called to the bar in 1886. He became a King's counsel in 1914 and privy councillor in 1930, maintaining both positions until his death. Lord Amulree, who was raised to the peerage in 1929, joined the MacDonald cabinet as secretary of state for air, and was president of the air council, 1930–31. He was also air minister in MacDonald's second cabinet and was active as arbitrator in labour disputes. He was chairman of the royal commission on licensing laws, 1929–31, and president of the industrial court of Great Britain, 1919–26. Lord Amulree died at Winterbourne, Wilts., May 5.

Anaemia. After three years of war no significant change in the level of haemoglobin was noted in infants in England, but there was a decrease in that of school children. A moderate decrease in the percentage of haemoglobin in women and children living in London was attributed to wartime diets. Pregnant British women of the artisan class were more anaemic than before the war. Iron medication is prophylactic.

Following haemorrhage there is a significant increase in the volume of water in cardiac muscle, the pancreas, pylorus, duodenum, colon, skin and liver, but not in skeletal muscle. After haemorrhage, hemodilution is complete in 24 hr. in normal individuals and in 3 to 4 days in patients who have undergone operations. After chronic haemorrhage in dogs, more haemoglobin than plasma protein is produced, regardless of the kind of protein used in the diet. The average time required to regenerate haemoglobin after donation of 555 cc. of blood is 49.6 days. The period is shortened to 35.2 days when 1 g. of iron and ammonium citrate is given daily. Liver and liver extract have value as accessories in haemoglobin regeneration after venesection in dogs. The iron of white bread is available for haemoglobin regeneration, but not that of brown (wheatmeal) bread. In anaemic rats, antiacids (calcium carbonate, aluminum hydroxide) reduce iron retention. In the absence of bile, anaemic dogs absorb iron normally when the diet is low in neutral fats but not when the fat content is high. Radioactive iron, liberated from dissolved "tagged" erythrocytes in acetylphenylhydrazine anaemia, is promptly reutilized, nearly quantitatively, in the regeneration of new red blood cells. In experimental anaemia in dogs, copper therapy is followed by an irregular, moderate increase in haemoglobin. Radioactive copper appears rapidly in the circulating red blood cells of anaemic dogs, after ingestion. Reserve iron stores, rather than the degree of anaemia, control the absorption of radioactive iron in anaemic dogs. The controlling mechanism is in the mucosa of the gastro-intestinal tract. In the treatment of dogs with anaemia of chronic haemorrhage, human liver is 20% to 60% more effective than animal liver.

Transfusion of blood, fluids and marrow cells via the sternal marrow cavity came into more general use. Transfusions were given successfully via the corpus cavernosum of the penis. The Rh factor received additional attention as an element in the etiology of erythroblastosis foetalis and as a source of transfusion reactions. The Rh antibody may be excreted in the milk of mothers of babies with erythroblastosis. Multiple transfusions to Rh negative recipients from Rh positive donors are potentially dangerous. There is a transitory increase in serum bilirubin after the transfusion of "stored" blood which is not present when fresh blood is used. Group O blood, in which the isoagglutinins have been neutralized by purified A and B substances, may be used safely in exsanguinating haemorrhages. Transfusion of plasma is effective in restoring the blood volume after small haemorrhages. "Conditioned" or "safe" universal blood was used more extensively in transfusion. A "fourth type" of erythroblastosis foetalis, showing hepatic cirrhosis, was described.

Serial bone marrow studies in patients with pernicious anaemia showed an increase in the degree of maturation of red blood cells, six hours after liver extract therapy. In three to four days the marrow is converted to the "normoblastic" type. In "pernicious" (megaloblastic) anaemia of pregnancy, the bone marrow is identical with that true (Addisonian) pernicious anaemia caused by arrested maturation of the megaloblasts. Hypoprothrombinaemia in pernicious anaemia (40% to 60% of the normal) is corrected by liver therapy but not by vitamin K. Additional cases of acute hemolytic anaemia after phenothiazine, sulphathiazole and sulphanilamide were reported. The primary pathogenesis of Cooley's anaemia is a disturbance of porphyrin metabolism. In acetylphenylhydrazine anaemia, the mechanism of erythrocyte destruction lies in the damaging of the red blood cells so that they are phagocytized by cells of the reticuloendothelial system. The blood plasma iron is abnormally high in dogs with anaemia from pyridoxin deficiency. With recovery, on pyridoxin therapy, the level is restored to low normal.

The fundamental pathologic physiology of sickle cell anaemia is thrombosis. This may result in cerebral thrombosis. Painful abdominal crises in sickle cell anaemia may be due to splenic infarcts with stretching of the capsule. Additional cases in white (Italian) families have been discovered. The bleeding in haemophilia may be controlled by the intravenous injection of lyophile human plasma. Infection, ileus, phlebitis and pulmonary complications are more frequent after hysterectomy in patients with anaemia than in those with normal haemoglobin content. The porphyrinuria of lead poisoning is not the result of haemolysis, but of dyshaemopoiesis. "Target" red blood cells are hyper-resistant cells produced by the bone marrow in response to blood loss. They are not the fundamental pathological cell of Cooley's anaemia but are temporarily present during the regenerative phase of any acute anaemia and for longer periods during chronic anaemia.

Anaesthesia. In Jan. 1942 the use of continuous caudal anaesthesia for labour and delivery was developed by Waldo B. Edwards and Robert A. Hingson, passed assistant surgeons, United States public health service, United States Marine hospital, Staten Island, N.Y. This was the most unique and outstanding contribution of the year in anaesthesia. Technical difficulties, such as breakage of needles, caused trouble at first. The suggestion of Dr. R. C. Adams of using an in-dwelling ureteral catheter was an ingenious alternate method of producing continuous caudal anaesthesia. This procedure reopened the question of anaesthesia in obstetrics. Much good was expected to come of the revival of interest. Among the most outstanding advantages are: little or no moulding of the head of the new-born with a minimal amount of respiratory difficulty for the baby, little or no pain for the mother, and a practical demonstration of the innervation of the uterus. The results obtained with this method depend on the skill and care in carrying out the procedure in order to avoid trauma and infection, and to avoid its use in cases in which patients do not tolerate local anaesthetics. Lemon's continuous spinal anaesthesia, the method which suggested continuous caudal anaesthesia, continued to be more and more widely used.

The year 1942 saw the army and navy of the United States giving equal consideration to medical officers in anaesthesia. This encouragement to the specialty gave added impetus to its advancement. This was reflected in increased activity and effectiveness of organizations of anaesthetists; that is, the American Board of Anesthesiology, Inc., the American Society of Anesthetists, the section on anaesthesiology of the American Medical association, the International Anesthesia Research society, the National Research council, and many sections on anaesthesiology of state medical societies.

Pender, Ashburn and Essex, acting on the suggestion of Captain F. R. Hook, (M.C.) U.S.N., investigated the question of the use of sulphonamide drugs in the presence of shock in anaesthetized animals. They found that sulphanilamide did not increase the risk to the animal and in some instances seemed to be beneficial. That is, some animals which had received sulphanilamide and which had suffered from shock lived longer while anaesthetized than did those which had not received sulphanilamide.

The teaching of anaesthesiology in medical school was assisted materially by the splendid discussion of anaesthetics in *The Pharmacological Basis of Therapeutics*. The plan of the National Research council for the training of medical officers, which included those engaged in anaesthesiology, increased considerably the number of physician anaesthetists. The experience derived from the courses of instruction developed intensified methods of teaching, stressed certain techniques and resulted in many successful teaching programs. (*See* also SURGERY.) (J. S. L.)

Anderson, Kenneth Arthur Noel (1891–), British army officer, was born Dec. 25 and was educated at the Royal Military college, Sandhurst. Starting in the army as a 2nd lieutenant in the Seaforth Highlanders, 1911, he was wounded in World War I and was awarded the military cross. After the war, he advanced through the grades and was made major general in 1940. Gen. Dwight Eisenhower, U.S. commander of Allied forces in Africa, selected Gen. Anderson as one of his three task force commanders in French North Africa. Appointed acting lieutenant general, Gen. Anderson led the British 1st army, supported by U.S. auxiliary and assault units, that advanced on Tunisia shortly after the initial Allied landings on Africa, Nov. 8, 1942. Anderson's forces made rapid progress in the early stages of the campaign and closed in on the axis strongholds of Tunis and Bizerte. Hitler, however, rushed reinforcements in planes and men to his Tunisian beachheads and brought Anderson's forces to a temporary halt by Dec. 5, at the villages of Tebourba and Mateur.

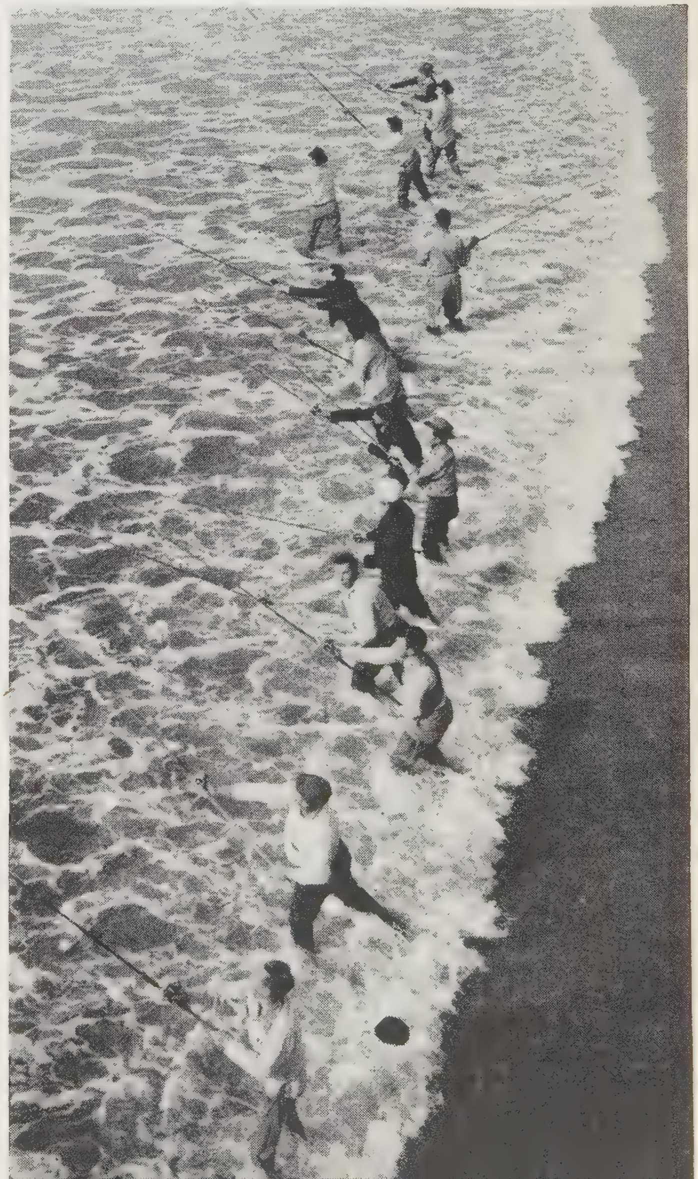
Andrews, Frank Maxwell (1884–), U.S. army officer, was born Feb. 3 in Nashville, Tenn. He was graduated from West Point, 1906, became a cavalry lieutenant and was promoted through the grades to colonel in 1935. Gen. Andrews saw service in the Philippines, 1906–07, and in Hawaii, 1911–13. He was a major with the signal corps during World War I and served with the U.S. army of occupation in Germany, 1920–23. He was appointed temporary major general of the air corps in 1935 and major general commanding G.H.Q. air force, 1936–39. While in the latter post, Andrews piloted an army air corps amphibian bomber 1,425 mi. from San Juan, Puerto Rico, to Langley field, Va., setting a new world's distance and straight-line record for amphibian planes. In Sept. 1941 he was promoted to the rank of lieutenant general and head of the Caribbean defense command and the Panama canal department. On Nov. 4, 1942, Gen. Andrews was given command of U.S. forces operating with the British in the middle east zone, and was awarded the D.S.M. on Dec. 19 for his role in the defeat of Rommel.

Angling. Coast guard regulations kept fishing boats away from most of the marine big-game fish grounds; many small craft were requisitioned for government use; tire and gasoline rationing affected both salt- and fresh-water anglers.

Added to this, priorities stopped the manufacture of fishing tackle early in the spring, for the duration of the war. Stocks on hand, at the end of the year, were estimated to last but a few months. Many items were unobtainable, notably rods and reels.

Tournament activities were greatly reduced, but interest remained keen in the events which were held. Among them was the

ANGLING EXPERTS practising for the U.S. All-Western Surf Casting tournament held at Long Beach, Calif., March 7, 1942



All-Western Surf Casting tournament at Long Beach, Calif., March 7.

No world's records were broken in salt water. The largest tuna taken by angling, according to available records, was a fish of 816 lb., caught by Frank Sawyer off Bailey's island, Me., in the late summer.

Striped bass runs were plentiful, and many fish weighing over 40 lb. were taken. The largest caught with rod and reel weighed 58 lb.—a fine specimen, but 15 lb. lighter than the world's record fish. Few broadbill swordfish were taken by angling, as most of the fishing waters lie within restricted zones.

A new world's record was established by a woman angler in a popular branch of the sport—wall-eyed pike fishing. Hazel Griffin of Akron, Ohio, captured a walleye weighing 19 lb. 12 oz., thereby bettering the existing rod-and-reel record of 18 lb. by 1 lb. 12 oz. This, incidentally, is the largest wall-eyed pike ever recorded captured by any method. The fish was taken at Deep Bay, Ont., Can., on June 16. (W. J. Sh.)

Anglo-Egyptian Sudan. A territory under the joint sovereignty of Great Britain and Egypt in northeastern Africa, south of Egypt (*q.v.*). Area 967,500 sq.mi.; pop. (est. Jan. 1, 1941) 6,362,852. Chief towns (pop. Jan. 1, 1941): Khartoum, inc. Khartoum North (61,641), Omdurman (117,041), Port Sudan (26,255), Atbara (19,757), El Obeid (33,328). Governor general: Lt. Gen. Sir Hubert Huddleston; languages: English and Arabic; religion: Mohammedan.

History.—With the fall of Gondar toward the end of 1941 the Sudan became remote from the active operations of the war; its effects on the ordinary inhabitant were reflected only in the increased cost of living and in the scarcity of such few luxuries as were in common demand, particularly sugar. As a result of the military operations based upon the Sudan the material condition of the people had been good, and since the Sudan was still playing its part in furnishing supplies, particularly sheep, cattle and camels, the prosperity in 1942 seemed likely to continue. There was much money in the country and little upon which to spend it. The cattle owner and the cultivator benefited, but the control of exports and of prices of essential foodstuffs protected the town dweller. The cost of living increased slowly, but the position generally was regarded with satisfaction. The decrease in the import of cotton piece goods, always an important factor in Sudan life, led to the revival of local spinning and weaving. This was formerly a widespread industry; Sudan cotton cloth, if not of the finest texture, was noted for durability. The Gezira cotton crop for 1941-42, averaging some 4 kantars to the feddan, was all shipped before the end of August. A noteworthy event of 1942 was the opening of the broadcasting station in Omdurman in February, when opportunity was taken to broadcast messages to some of the tribal gatherings. The events in India and the failure of the Cripps mission aroused great interest among the educated and politically-minded classes. A record number of pilgrims, including many from Eritrea and Ethiopia, were carried from Port Sudan and Suakin to Jidda for the pilgrimage. (B. H. B.)

Education.—(Jan. 1, 1941) Government schools: elementary schools 137, scholars 17,184; intermediate schools 11, scholars 357; Gordon Memorial college: scholars 1,308; state-aided Koranic schools 501, scholars 23,000; scholars at nongovernment (mission) schools 12,925.

Banking and Finance.—In 1940: revenue £E7,143,731; expenditure £E7,052,899; public debt (Dec. 31, 1940) £E10,023,570; exchange rate £E1 = £1 0*s.* 6*d.* = approx. $4.14 (U.S.) in 1942.

Trade and Communication.—In 1941, imports were valued at £E5,466,901; the value of exported merchandise amounted to £E8,547,327; re-exports £E337,718. Communication: roads, suitable for motor traffic, all weather, *c.* 1,000 mi.; railways 1,991 route miles; river service 2,325 mi.; motor vehicles licensed (1937) 4,354 cars, commercial vehicles and cycles; telephone subscribers (1938) 2,383.

Agriculture and Mineral Production.—(1938–39) Production (in metric tons): cotton seed (1940–41) 89,300, ginned cotton (1940-41) 49,600, millet (1937–38) 315,000, sesamum 33,200, maize 10,300, wheat 8,200, ground-nuts 8,600, barley 1,600, gold (1938) 252 kg.

Annenberg, Moses Louis (1878–1942), U.S. publisher, was born Feb. 11 in Insterburg, East Prussia. His father, a small shopkeeper, emigrated in 1885 with his eight sons to Chicago, where Moe shifted from job to job until he joined the subscription department of the *Chicago Tribune*. He then became circulation manager of the *Chicago Examiner*, 1904, and three years later went to Milwaukee as distributing agent there for all Chicago papers. In 1917 he became publisher of Arthur Brisbane's *Wisconsin News*, and was circulation manager of the Hearst newspaper chain, 1919–26. In 1922 he bought the *Daily Racing Form*, which became the foundation-stone of the "Annenberg empire." He introduced the relaying, by phone and wire, of race results to "bookies" throughout the country on such a scale that he was the fifth largest customer of the American Telephone and Telegraph company. Expanding his interests, he acquired radio, screen and pulp magazines and newspapers; in 1936 he bought the *Philadelphia Inquirer*. In 1939 he pleaded guilty to a federal charge of income tax evasion and although he agreed to pay $9,500,000 in settlement of all the government claims, he was nevertheless sentenced to a three-year term in a federal prison. He was released in June 1942 and died in Rochester, Minn., July 20.

Anthropology. Anthropology in 1942, was facing a paradoxical crisis: the increasing employment of anthropologists in the war effort as administrators and consultants and the growing recognition of the value of anthropology in dealing with the many problems of human organization arising out of the emergency was accompanied by a marked decrease in the production of trained anthropologists. This crisis was the result of the marked difference which had grown up in recent years between the teaching of anthropology and its practice, a difference accentuated by the fact that almost all of those responsible for the modern trend were in government service and no longer free to influence teaching. Lacking this influence, little was done to reorganize curricula so that students could be fitted to the need of government agencies and the armed services, and no emphasis was placed, in the colleges, on the contributions anthropology could make and had already made.

The extension of U.S. activities over the face of the globe created a basic need for people who were able to appraise the way in which widely differing groups of people could be fitted most effectively into the war effort and brought to co-operate fully with U.S. representatives. This seemed particularly important if the groundwork was to be laid for the rehabilitation of these areas and their eventual participation in a world-wide system. A similar lack of trained investigators was being faced in the U.S. where the dislocations in community functioning due to the radically changing industrial structure, the many organizational difficulties in industry and government resulting from the process of applying controls over the habitual routines of every citizen, whether as producer or consumer, and the concomitant maladjustments in individual lives were all problems for whose diagnosis and solution anthropology is of great value.

The year 1942 brought forth a number of important advances in knowledge, although the amount published was sharply reduced. C. M. Arensberg and D. Macgregor demonstrated the steps by which the increase in size and volume of business of an industrial company brought about marked changes in its organizational structure. In this company, the engineering department, which had been an important staff unit, moved gradually into a line position several steps lower in the hierarchy without management being aware of what was happening until the resulting increase in generalized dissatisfaction among the engineers made them realize that something was wrong. From this study, it is clear that similar changes with consequent loss of efficiency and lowering of morale must be looked for in almost every organization, such as the several agencies of the federal government and the war industries which underwent a tremendous expansion in number of employees and in volume of business handled ("Determination of Morale in an Industrial Company," *Applied Anthropology,* vol. 1, no. 2).

F. L. W. Richardson, Jr. published the second part of his analysis of a resettlement project in which he showed that the influence of regional forces upon small resettlement projects was so great as to make it extremely unlikely that they would be able to achieve a stable community existence if the region itself was in an unstable state. He emphasized that the solution of the unemployment problem could only be achieved in terms of regional planning based upon the utilization and modification of existing systems of relations ("Community Resettlement in a Depressed Coal Region II," *Applied Anthropology,* vol. 1, no. 3).

J. Gillin in a study of the Flambeau Chippewa showed how the effects of continual changes in the administrative policies of the agency system quite unwittingly were to condition the Indians to a habitual state of uncertainty and apathy which resulted in extremely poor assimilation during the period 1885–1934 ("Acquired Drives in Culture Contact," *American Anthropologist,* vol. 44, no. 4).

The publication of *Principles of Anthropology* by E. D. Chapple and C. S. Coon (Holt, New York) marked the appearance of the first textbook in the field in which the analysis was based upon the properties of human interaction. It provides a systematic account of the physiological basis of human behaviour and the ways in which environment and technology acting on human relations combine to build up human institutions. Together with C. M. Arensberg, Chapple and Coon presented before the American Academy of Arts and Sciences a symposium, "Anthropology and World Equilibrium," in which they outlined the principles which they considered to be basic in organizing and administering a world system. They discussed the reasons for setting up political units (which would form the component elements of a world organization) which represent natural geographic-technological regions within which trade and the exploitation of natural resources occur within the bounds set by natural barriers, climate and the common highways of travel. They emphasized the necessity for a world police force, the inclusion of all peoples in the system, and the fundamental significance of democratic systems of government in maintaining stability and promoting administrative efficiency. They warned against the failure to plan such a system long in advance, working out the specific steps to be taken and the timing required to put them into operation. They also stressed the importance of using the task of feeding the starving populations and returning the economy to a peacetime basis as mechanisms by which populations could begin to be educated to use the new machinery (*Proceedings of the American Academy of Arts and Sciences,* vol. 75, no. 1).

Also concerned with the utilization of full human resources in the war effort was M. Mead's popular book, *And Keep Your Powder Dry* (Morrow, New York), which gives her conception of the basic behavioural characteristics of the people of the United States which have to be taken into account if full efficiency is to be obtained. Basing her analysis on the way in which children are brought up and the conduct patterns which result, she points out how these differ from those found in other countries. She then goes on to suggest ways in which the administrator should handle people on the home front to secure full and wholehearted co-operation.

Another active field for anthropology in 1942 was the work of the Committee on Food Habits of the Division of Anthropology and Psychology of the National Research council. This committee fostered a large number of studies intended to help determine how food habits can be changed in order to raise the nutritional status of the people of the United States and ultimately of other peoples of the world. The research had two major aspects, determining existing patterns of food habits and testing out methods of changing them. M. Cussler and M. deGive of the Office of Defense Health and Welfare Services, Office for Emergency Management, published one such study which indicated the importance of working out the regional network of relations in order to determine what persons were in a strategic position to institute changes and how these changes had to be introduced so as not to destroy habitual routines which played an important role in the existing system of relations ("The Effect of Human Relations on Food Habits in the Rural Southeast," *Applied Anthropology,* vol. 1, no. 3).

Facing the need for a stocktaking in the methods of investigation actually being employed to solve problems of human relations, the Society for Applied Anthropology devoted its annual meeting, held in Washington, D.C. in Oct. 1942, to a critical evaluation of methods used to deal with specific problems and the results obtained by their use. Four major topics were discussed: the mapping of spacial relations with the emphasis on means of defining environmental influences; methods of making observations on the relations of individuals with much attention being paid to new methods of measurement which have recently been introduced; techniques of interviewing; and the relative value of the different methods in dealing with specific problems. The results of the discussion were to be summarized and issued as a handbook in 1943. Dr. John Provinse of the War Relocation authority was elected president of the society for the term 1942–43.

Because of the war, the annual meeting of the American Anthropological association which was to be held in Toronto in December was abandoned. (E. D. C.)

Antimony.

There was little information available on world production of antimony, or on the supply in the United States. Efforts were being made to expand ore production in the United States in several different localities, particularly in Alaska, Arizona, California, Montana, Nevada, Oregon and Washington, but nothing was made public on the results. Imports were being maintained; the metal in ore imported in the first nine months of 1941 being only slightly less than the total for 1940, while metal receipts were several times the usual amount; receipts from China were of course cut off completely, but South American and Mexican ores were arriving in good volume.

Bolivian exports of antimony increased from 11,753 metric tons in 1940 to 14,870 tons in 1941. Peruvian exports were 1,463 tons in 1941, and were expected to double in 1942. The Mexican output, which had formerly furnished the largest share of the United States imports, declined from 12,267 tons in 1940 to 11,132 tons in 1941. (G. A. Ro.)

Anti-Saloon League of America, Inc. The Anti-Saloon League of America is a non-partisan, interdenominational, federated temperance organization formed in 1895. During 1942 its state activities consisted of temperance education, efforts to secure reduction in the number of liquor licences and limitations upon hours of sale, and local option elections on sale of liquor in local communities. In the units voting, non-sale prevailed by 8 to 6.

In Arkansas the voters approved by a vote of 52,830 to 41,040 an initiated law providing that on petition of 15 per cent of the qualified electors (instead of the former 35 per cent), special local option elections may be called in counties, townships, municipalities, wards or precincts on the question of the manufacture or sale of intoxicating liquors, *i.e.,* any beverage containing more than one-half of 1% of alcohol by weight.

Nationally, the league centred upon petitions and appeals to the administrative and legislative branches of the government to minimize the evils of liquor during the war. Many restrictions were imposed on the manufacture and sale of alcoholic beverages, such as the conversion of the distilleries to the production of industrial alcohol, limitations on materials used in processing liquors, curtailing hours of sale and, to some extent, rationing.

The subject of liquor in relation to the armed forces came before congress when Senator Josh Lee, on Oct. 22, offered in the senate an amendment to the Gurney Teen Age Draft bill to incorporate therein the text of a bill introduced by the late Senator Morris Sheppard to prohibit the sale or possession of alcoholic beverages within military or naval establishments, and to authorize the secretaries of war and the navy to establish reasonable zones around such establishments within which the sale or possession of alcoholic beverages would not be permitted. This was opposed by the war and navy departments, and on motion of the majority floor leader the amendment was committed to the Senate Military Affairs committee for hearings by a vote of 49 to 25, 22 not voting.

Subsequently, on Nov. 16, the senate, by a vote of 44 to 19, 33 not voting, refused to consider the Sheppard bill itself, which had been reported by the Military Affairs committee without recommendation. National headquarters are at 131 B st. S.E., Washington, D.C. (*See* also LIQUOR CONTROL.) (E. B. DU.)

Anti-Semitism. Hitler reiterated, on Jan. 31, 1942, the ninth anniversary of the establishment of his régime, that he aimed at the physical extermination of the Jews in Europe, of whom by then about 7,000,000 were under his rule or influence. After the R.A.F. raids on Cologne the German propaganda minister, Josef Goebbels, declared that Germany proposed to carry out in reprisal a mass extermination of the Jews throughout Europe, and "perhaps even beyond Europe." This extermination proceeded during 1942 in almost continuous pogroms of the Jewish population of eastern Europe.

In German controlled countries Jews were denied ration cards, given to the rest of the population, for clothing and for many essential articles of food, with the exception of bread and potatoes. For their purchases only one hour in the late afternoon was allotted, and this only in a few stores. More than 2,000,000 Jews were confined to newly created ghettos, where living conditions, especially the lack of sanitation, were responsible for an unprecedented death rate among the inhabitants. Especially dreadful were the conditions in the conquered Russian territories and in the parts of the Ukraine occupied by the Rumanians.

Most of the Jews of central and western European countries which came under national socialist domination were transported to eastern Europe, where they were either shut up in overcrowded ghettos or, irrespective of age or training, put to heaviest menial work. All their property was confiscated; they did not enjoy any protection of law or any security whatsoever. The yellow badge had to be worn by Jews in all countries occupied by Germany. This badge excluded them not only from the use of any cultural or social institution and from the enjoyment of any recreation, but also from every contact with non-Jews. All Jewish social, cultural and religious institutions were destroyed or forbidden, and Jews were not allowed to use any public means of transportation, to own radios or to visit parks.

The situation of the Jews in Italy, Hungary and non-occupied France was slightly better than in Germany. Yet even in those countries Jews were deprived of all political and social rights and were excluded from all professions and all gainful occupations, with the exception of a few kinds of menial labor. The official propaganda singled out the Jews as responsible for the war. This propaganda campaign against the Jews was conducted with especial violence in Italy, where the American war effort was identified with Judaism.

The greatest deterioration in the Jewish position happened in 1942 in France. In the occupied zone, measures were introduced on July 14 which excluded them entirely from any contact with the French people and reduced their status to that of the German Jews. In the early fall, thousands of Jews born outside of France, but having found a refuge in that country, were deported to eastern Europe. Families were separated, small children left behind. Soon these measures were extended to the nonoccupied zone, where the accession of Pierre Laval to power marked a very far-reaching degeneration of the status of all Jews. On May 8, 1942, Marshal Pétain named Darquier de Pellepoix the new general commissioner of Jewish affairs in France to replace Xavier Vallat, an anti-Semitic leader in France before World War II, who was much more moderate than his successor. De Pellepoix was one of the most militant of anti-Semites.

The extreme anti-Semitic measures of the German administration and the Laval government aroused in France bitter criticism and open opposition on the part of the non-Jewish population. Some of the leading Catholic prelates of France protested against the inhumanities perpetrated upon the helpless Jews. The new violent forms of anti-Semitism were recognized as the most ingenious single device of German propaganda in its efforts to weaken Germany's adversaries by disseminating racial and religious strife and by undermining the foundations of democracy and Christianity.

Of the countries under German influence yet not occupied directly by Germany, it was only in Bulgaria that the anti-Semitic measures of national socialism were applied with full ferocity, a ferocity only equalled by the persecutions and wholesale massacres in Rumania. On the other hand there was much less open anti-Semitism in the western hemisphere, where, with the exception of Argentina, propaganda of a pro-fascist nature and appeasement policies toward fascist ideology and war policy were condemned and driven into hiding. Several notable anti-Semitic publications, which had generally followed the line of national socialist propaganda, were suspended, and some of the more militant organizations were disbanded.

Towards the end of 1942 substantiated reports emanating from all German-occupied countries in Europe on the accelerated and premeditated extermination of the Jewish people aroused widespread indignation. Eleven of the United Nations, Belgium, Czechoslovakia, Greece, Luxembourg, Netherlands, Norway, Poland, soviet union, Great Britain, the United States, Yugoslavia, and the French national committee of the Free French released an official statement that their intention "has been drawn to numerous reports from Europe that the German authorities, not content with denying to persons of Jewish race in all the territories over which their barbarous rule has been extended the most elementary human rights, are now carrying into effect Hitler's oft-repeated intention to exterminate the Jewish people in Europe." Then followed what may be regarded as an official summary of the extent of anti-Semitism in Germany and countries under its influence. From all occupied countries Jews were being transported "in conditions of appalling horror and brutality" to eastern Europe, especially to Poland, which became the "principal nazi slaughterhouse." The ghettos established there were being systematically emptied of the Jews who were slowly worked to death in labour camps or left to die of exposure and starvation or deliberately massacred in mass executions. The governments "condemn in the strongest possible terms this bestial policy of cold-blooded extermination. They reaffirm their solemn resolution to insure that those responsible for the crime shall not escape retribution and to press on with the necessary practical measures to this end." (*See* also FASCISM; JEWISH RELIGIOUS LIFE; REFUGEES.)

Anti-Tank Guns: *see* MUNITIONS OF WAR.

Antonescu, Ion (1882–), Rumanian soldier and statesman, was born in Transylvania June 2 and fought with the Rumanian armies during World War I, after which he was promoted to the rank of colonel. He later became military attaché of Rumania in London and Rome, chief of the army's general staff and war minister. He was named prime minister by King Carol Sept. 5, 1940, in the midst of the disorders that followed the partition of Rumania. Antonescu's first act was to demand the abdication of Carol. The prime minister then assumed dictatorial powers and on Sept. 14, 1940, formally promulgated a totalitarian rule.

He established working relationships with the axis by signing the German-dictated pact of Nov. 23, 1940.

After subduing the Iron Guardist anti-Semitic riots of late Jan. 1941, Antonescu tightened his grip on the government, with German backing, and decreed the death penalty for acts of terrorism and disorder. In a controlled plebiscite of early March 1941, Rumanians approved his regime by a vote of 2,490,944 to 2,816. Antonescu marched against the U.S.S.R. on the same day (June 22, 1941) that Hitler's troops crossed the Russian border. He then assumed the title of generalissimo and commander of the Rumanian armies in Bessarabia.

In Feb. 1942, Antonescu conferred with Hitler, Goering and Field Marshal Keitel. The nazi trio were reported to have demanded additional Rumanian troops for their summer offensive. Antonescu responded by decreeing "pre-military" training for boys between 17 and 21. The new demand for levies was not popular and in March 1942, Antonescu ordered drastic measures to curb anti-fascist unrest. The morale of his countrymen weakened because of heavy Rumanian casualties on the Russian front, especially around Odessa, Sevastopol and Stalingrad. In Sept. 1942 a government decree centralized all legal power in Antonescu's hands. (*See* also RUMANIA.)

Aosta, Amedeo, DUKE OF (1898–1942), Italian general and former viceroy of Italian-occupied Ethiopia, was born Oct. 21 in Turin, Italy. He was the son of Prince Emanuele Filiberto, duke of Aosta, and of Princess Helen of France. The duke was thus a cousin of King Victor Emmanuel of Italy, and was head of the house of Savoy-Aosta, second branch of the ruling family of Italy. At 17 he entered the army as a private in the artillery and saw active service at the front during World War I. He rose rapidly through the ranks, was decorated many times for valour, and enjoyed wide popularity among all classes of Italians. A thorough-going fascist, he was an admirer and close friend of Mussolini. In 1937 he was named viceroy of Ethiopia, succeeding Marshal Graziani, a move calculated to link far-flung Ethiopia with the European prestige of the house of Savoy. During the period of British attacks on Ethiopia, 1940–41, he directed the Italian forces and won promotion to general of the Italian air force. In May 1941, the duke of Aosta, with a force of 7,000, surrendered to British troops at Amba Alagi after a long siege. He died of tuberculosis while still a prisoner at Nairobi, Kenya, East Africa, March 3.

Apples. Production of commercial apples in the United States in 1942 was 127,655,000 bu. In 1941 it was 122,256,000 bu.; the ten-year (1930–39) average was 123,823,000 bu. The commercial crop includes apples for processing as well as those sold for fresh consumption. Growers in eastern and northwestern states experienced considerable difficulty in harvesting the 1942 crop because of scarcity of farm labour. The Canadian government in 1942 authorized an appropriation of $1,265,000 to be used in an agreement with the British Columbia Fruit board in guaranteeing the price of apples at $1 to $1.25 per box. All sales of apples in Canada had to be at prices authorized by the minister of agriculture.

(S. O. R.)

U.S. Apple Production in Leading States, 1942 and 1941

State	1942 bu.	1941 bu.	State	1942 bu.	1941 bu.
Washington	27,552,000	27,000,000	Maryland	2,211,000	1,905,000
New York	17,500,000	16,302,000	Idaho	2,139,000	2,442,000
Virginia	13,908,000	11,800,000	Connecticut	1,922,000	1,412,000
Pennsylvania	10,031,000	8,643,000	Colorado	1,595,000	1,510,000
Michigan	9,234,000	8,000,000	Indiana	1,392,000	2,230,000
Ohio	6,384,000	6,000,000	North Carolina	1,086,000	1,505,000
California	6,090,000	7,706,000	Missouri	1,075,000	1,504,000
West Virginia	4,686,000	4,288,000	Delaware	940,000	913,000
Massachusetts	3,400,000	2,488,000	New Hampshire	961,000	659,000
New Jersey	3,239,000	2,632,000	Kansas	754,000	406,000
Illinois	2,970,000	3,410,000	Vermont	731,000	664,000
Oregon	2,660,000	2,471,000	Maine	730,000	581,000

Aquariums. Because of gasoline rationing the Marineland aquarium, near St. Augustine, Florida, was forced to close its doors until the time when such restrictions on travel might be lifted. This was the first closure of a public aquarium in the United States directly attributable to war conditions.

After the closure of the New York aquarium, an interim small collection was established in the New York Zoological park which had its public opening on Feb. 12, 1942. Research activities of the New York aquarium were continued, in part in this place and in part at the American Museum of Natural History.

Little could be learned of aquariums in other countries, but other similar institutions in the United States progressed. All were handicapped by the virtual impossibility of obtaining specimens from distant points. (C. M. Br.)

Aqueducts.

The Colorado river aqueduct, constructed by the Metropolitan Water District of Southern California at a cost of approximately $200,000,000 extends 241 mi. from Parker dam on the Colorado river to Cajalco reservoir, 12 mi. south of Riverside, Calif. This aqueduct is capable of delivering 1,000,000,000 gal. daily to Los Angeles and 12 neighbouring coastal cities. With the last of the tunnels on the distribution system completed in 1941, the entire system totalling 392 mi. was in complete operation on Aug. 18, 1941. The Delaware river aqueduct, an 85-mi. pressure tunnel, being built by the board of water supply of New York, is an important feature of the $298,000,000 Delaware project which will add 540,000,000 gal. daily to New York city's water supply, thus increasing the supply 50%. The last of the major tunnelling jobs was holed through Sept. 17, 1941, completing 83.8 mi. of the aqueduct which will carry water 300 to 1,000 ft. underground from the watersheds of the Catskill mountains to Hillview reservoir on the northern boundary of New York city. Final holing through of the entire tunnel was expected in the spring of 1943.

The All-American canal, biggest irrigation ditch in the United States, began operation of its full length during 1941. It carries water diverted from the Colorado river by Imperial dam a distance of 80 mi. into Imperial valley. With its 130-mi. Coachella branch canal, excavation for about two-thirds of which was completed in 1942, water will be supplied for 1,000,000 ac. in southern California. As a part of the Boulder canyon project, the All-American canal system was being built by the bureau of reclamation at an estimated cost of $38,500,000. The boring of a 13.1-mi. tunnel, which will carry water from the western slope through the Continental Divide to irrigate agricultural lands in northeastern Colorado was proceeding from both ends and was approximately two-thirds completed in 1942. A 9-mile section of a 40-mile aqueduct to convey water from Deer Creek reservoir in Provo Canyon to Salt Lake City was completed in 1942. On the Central Valley project in California the first 38 miles of the 46-mile Contra Costa canal were in use serving fresh water to industries, cities and farms; and the first 8 miles of the 40-mile Madera canal to carry water from Friant reservoir to thirsty lands in the San Joaquin Valley were completed. Construction of these facilities by the U. S. Bureau of Reclamation was advanced or retarded in 1942 in line with their respective importance to the war program.

A pipe line aqueduct project was put in service in 1941 bringing to Toledo, O., a supply of good water from Lake Erie to replace the old and unsatisfactory supply from the Maumee river. Construction of the Key West aqueduct, to extend from the mainland near Miami, Fla., to the tip of the Key West peninsula, a distance of 134 mi., was planned for immediate construction in Dec. 1941 to supply fresh water for the navy and the Key West civilian population. (*See* also Canals and Inland Waterways; Dams; Tunnels.) (J. C. Pa.)

Arabia.

Total area (est.) 1,000,000 sq.mi. Total pop. (est. 1937) 9,300,000; Saudi Arabia 4,500,000; Yemen 3,500,000; Oman and Muscat 500,000; Kuwait 80,000; Trucial Sheikhs 80,000. Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Abd-ul-Aziz ibn Sa'ud; Yemen, Imam Yahya ibn Muhammad ibn Hamid ad-din; Oman and Muscat, Sultan Sayyid Sa'id ibn Taimur; Kuwait, Sheikh Ahmad ibn Jabir as-Subah.

THE EMIR MANSUR, sixth son of King Ibn Sa'ud of Saudi Arabia, inspecting a British guard of honour at Suez, Egypt, in 1942

History.—King Abd-ul-Aziz ibn Sa'ud continued to show an unswerving friendliness toward the United Nations. In February he broke off diplomatic relations with Italy, thus removing the last accredited representatives of the axis from his dominions Judge Bert Fish, the first United States minister to Saudi Arabia presented his letters of credence to King Abd-ul-Aziz on Feb. 4 In the course of the year a United States agricultural mission was sent, at the request of the Saudi government, to advise on the possibilities of developing water resources and agriculture; it was headed by K. S. Twitchell. In anticipation of mining or industrial developments, an elaborate decree for the protection of workers was issued in May.

Approximately 80,000 pilgrims went to Mecca in Dec. 1941, including 10,000 who travelled by sea from India and the East Indies. The government of India announced with regret, in the autumn of 1942, that owing to the presence of Japanese submarines in the Indian ocean it would not be possible to organize the sea-borne pilgrimage in that year.

Agreements were concluded in April between the government of Saudi Arabia and the British government, acting on behalf of the Sheikhdom of Kuwait; they provided for more effective checks on smuggling, and for the appointment of frontier officers to prevent raiding.

The sheikh of Bahrein, Sir Hamad ibn Isa al-khalifah, died in Feb. 1942; he was succeeded by his eldest son, Sheikh Salman. (H. By.)

Finance.—Monetary unit, Indian rupee, and in Saudi Arabia the rial. Exchange rate in 1942: 1 rial = Rs. 1 (Indian) = U.S. cents 30.12.

Trade.—With India (1939–40): Oman and Muscat, imports Rs.24,55,362; exports Rs.35,71,387; other states of Arabia, imports Rs.9,89,030; exports Rs.73,18,701. With the United Kingdom (1938): Saudi Arabia and Yemen, imports £94,960; exports £28,871; Oman and Muscat, Trucial Sheikhs and Kuwait, imports £40,262; exports £18,354. Total trade of Oman and Muscat (1938–39): imports Rs.48,76,193; exports Rs.33,31,939; Kuwait (1937–38): imports £410,812; exports £174,006. (*See* also Islam.)

Archaeology.

Western Hemisphere.—After 1930, archaeological exploration and research within the United States attained an unprecedented level. This was due to several factors. Two of the most important reasons for such a nationwide impetus given to the solution of archaeological problems were: (1) the financing of extensive state-wide archaeological programs by the federal government through such agencies as the Civil Works administration, the Work Projects administration, and Civilian Conservation corps; (2) the establishment of a diagnostic type of projectile point in direct association with extinct animal forms, namely, the Folsom horizon.

In 1942 these numerous archaeological programs were terminated as rapidly as conditions would warrant. By the end of the year all explorations within the United States ceased, while some of the laboratories and museums continued the classification, restorations and preservation of the cultural material obtained in previous years.

As a part of the government's program for the promotion of goodwill with the scientific institutions in the other American republics, archaeological explorations were sponsored under the auspices of the Office of the Co-ordinator of Inter-American Affairs and other scientific institutions from the United States.

In many of the Latin-American countries a very justifiable pride exists in their prehistoric Indian cultures. The Institute of Andean Research in co-operation with the co-ordinator of inter-American affairs directed a program consisting of 10 distinct field parties, ranging from northern Mexico to Chile. As a result of these intensive stratigraphic excavations a temporal framework was outlined which would clarify the relationship between the centres of prehistoric civilizations in Middle and South America and their possible relationship with the aboriginal cultures in North America.

In the Arica region of Chile several stratified sites revealed the development from a simple hunting peoples with a lithic culture to more sedentary agricultural groups producing pottery, woven garments and the manufacture of metal implements. Some work was in progress farther south in the vicinity of Taltal. In coastal Chile the excavations verified a preceramic culture advanced many years ago by South American archaeologists.

In the Peruvian highlands, near Lake Titicaca and Bolivia, many late and early sites were discovered, including burial towers, houses and forts. One fortress described in some of the Inca chronicles was definitely located near the temple of Pucara. Future excavations at these sites might solve temporal relationship of the two important highland cultures. Excavations were made near Cuzco which might clarify the problem of the Inca culture with the earlier highland cultures. Along the central southern coast of Peru excavations were made in the large refuse heaps accumulated by the early Inca inhabitants. The Pachacamac deposit, over 40 ft. in height, revealed an abundance of pottery types which, because of their stratigraphic position, were expected to provide an unprecedented sequence of cultural developments. In the north central highlands of Peru excavations were made at the famous Marca Huamachuco site which revealed a considerable variety of structures, carved stones and pottery types. All of these Peruvian excavations were co-ordinated with the work of the leading archaeologists in the museums and universities of Peru.

Archaeological surveys and excavations were made along the coast and the highland region of Ecuador. In Colombia a general survey was accomplished and intensive excavations were made in the Cali region on the middle Cauca river between Quimbaya and the Tierradentro regions. Several interesting burial tombs were discovered on the outside slopes of prehistoric house platforms. These tombs consist of shafts averaging about 5 ft. in diameter reaching a depth of 6–8 ft. In one tomb more than 200 pottery vessels had been placed with the deceased. No large ceremonial structures such as occur in Peru were discovered. Some of the excavations in eastern Colombia might produce the desired evidence to show a connection between the highly developed cultures to the north in Central America and those in Ecuador and Peru.

In El Salvador excavations were conducted at San Andres in the western part of this Central American country. Deep human deposits separated by a volcanic stratum, near the Quelepa site, might upon final analysis reveal an interesting sequence of prehistoric cultures.

In connection with problems relating to the influence of cultures from South America upon the West Indies, several explorations were made in middens and caves in Cuba. On the island of Trinidad evidence was found to prove the long-assumed connections between South America and the West Indies. Surveys were made and some sites were excavated along the northern coast of Venezuela up the Orinoco river and on the north shore of the Gulf of Paria.

In Mexico the work of the Institute of Andean Research was fitted into the national program of archaeological research in Mexico. Surveys and excavations were carried on in the states of Jalisco and Michoacan. Here three major ceramic complexes were revealed, two of which date from the time of the European conquest and one preceding this period. In northeastern Mexico within the state of San Luis Potosí and around Tampico, excavations revealed plaster-covered conical burial mounds with stairways, and in one instance six superimposed plastered layers. One refuse deposit 20 ft. in depth produced ceramic evidence of at least six different periods. The earliest period pottery was comparable to that at Monte Alban and the early periods found in the Maya area. At Tancol near Tampico a distinct pottery complex was discovered which is comparable to certain types in the lower Mississippi river region.

The Smithsonian Institution-National Geographic society expedition resumed its excavations at the La Venta site in northern Tabasco. Here, for the first time, a stone sarcophagus in the form of a crouching jaguar was uncovered. Some of the finest pieces of carved jade—surpassing even the specimens previously reported from Cerro de las Mesas—had been buried with the individual. Another tomb was discovered consisting of basalt columns over a burial platform which had been covered with a thick layer of cinnabar. The Direccion de Monumentos Prehispanicos of the Mexican government co-operated and assisted in most of the above projects. At the same time they continued their own program of archaeological research in various parts of Mexico. Other scientific and governmental organizations in Guatemala and the various countries in South America carried forward their programs of archaeological research.

Through the efforts of the National Research council an archaeologist was assigned to the staff in charge of building the Alaska-Canadian highway. Even though this road covered an area which could have served as a corridor for the southern migration of Folsom man, no campsites were discovered. Near the town of Ojai, Ventura county, in southern California, two superimposed burial grounds were excavated. The lower graves, of a hunting group, were dug in the reddish hard soil, while the more recent Canalinas Indians were placed in the upper black soil. The earlier hunting groups used abalone shells and bone for ornaments. A cave site in southern Nevada was excavated by the Southwest museum. This cave contained a hafted stone projectile point, dice made from split and flattened corncobs and bone, stone and bone implements, as well as Pueblo pottery and basket fragments. The National Park service conducted an archaeological survey along the Yampa and Green rivers in northwestern Colorado and eastern Utah to determine the number of caves and rock shelters that would be inundated in the event that certain proposed power dams were to be erected in the Green river. The University of Denver continued its survey and mapping of aboriginal stone enclosures in the San

Luis and Upper Rio Grande valleys in southern Colorado and northern New Mexico. In northern Illinois a prehistoric woodland site near Dixon was selected by the University of Chicago for the training of archaeological students. This consists of a group of linear and conical mounds which were to be levelled by suburban development.

Bibliography.—Several archaeological reports were published during 1942 (vol. 44, *American Anthropologist*, and vol. 8, *American Antiquity*). The two most outstanding publications for 1942 were: *Anasazi Basketry*, Basket Maker II through Pueblo III, based on specimens from cave explorations from the San Juan river country in the American southwest, by Earl H. Morris and Robert F. Burgh, pub. 533, Carnegie Institution of Washington; *An Archeological Survey of Pickwick Basin in the Adjacent Portions of the States of Alabama, Mississippi and Tennessee*, by William S. Webb and David L. DeJarnette, Bull. 129, Bureau of American Ethnology, Smithsonian Institution, Washington, 1942. (F. M. Se.)

Eastern Hemisphere.—In spite of wartime conditions, there is new archaeological material to report for the year 1942, from the eastern hemisphere. The following list cannot be assumed to be complete, since information on possible finds in the axis-occupied territories was practically non-existent in 1942, and news of archaeological activity in other parts of the old world was generally brief and tardy. Purposeful excavation was very restricted, but a good deal of information seemed to derive from finds made accidentally, often in conjunction with some wartime activity such as road building. Preliminary reports on two small but very important excavations were available, however. The publication of materials found after 1930 proceeded, and several very important volumes appeared during 1942.

What seemed to be the most important reports on excavations carried on up to the close of 1942 were two from the near east. Both operations were actually carried on during 1941, but the reports were only available in 1942. The first was that done by the Directorate of Antiquities of the Iraq government under Seton Lloyd, Sayed Fuad Sofar and Sayed Mohammad Ali Mustafa, at Tell ʻUqair, some 50 mi. south of Baghdad and about equidistant between the Tigris and the Euphrates. A temple of the Uruk period (the second of the three predynastic sequences in south Mesopotamia; *i.e.*, the el-Obeid, Uruk and Jemdet Nasr periods) was exposed in some area, and smaller soundings yielded material of all three of the predynastic sequences as well as some materials referring to historic times. The indicated stratification is, in brief, as follows: (1) the earliest or el-Obeid material, from a small sounding which reached virgin soil after proceeding through seven layers of occupation; (2) the earliest traces of a platform prepared for a temple, but for which only architectural evidence was available; (3) the Uruk period temple, on its platform, and with interior walls decorated with frescoes; (4 and 5) two successive "fillings" of the platform, from which potsherds of the nonpainted but burnished Uruk variety appeared, as they had in the painted temple; (6) a layer with no surviving buildings but with painted pottery of the Jemdet Nasr type; (7 and 8) two successive occupations of a "chapel," first with Jemdet Nasr painted ware alone, and then with a mixture of Jemdet Nasr painted ware and "scarlet ware" and with a new type of brickwork; and (9) traces of later Akkadian and Babylonian occupations on a small scale and without massive architecture.

The earliest, el-Obeid, assemblage is important in that a considerable variety of the characteristic painted pottery was recovered (actually more common in buff ware than in the supposedly most characteristic "greenish" ware) with painted motifs including representational drawings of birds and animals as well as the usual geometric repertoire. The el-Obeid assemblage also included a considerable number of baked clay tools: sickles, long "nails" with hooked points, and some very remarkable shaft-hole axes of which one type definitely recalls the "battle-axe" of Troy II type. Bone tools in bitumen hafts also appeared, as well as flint hoes and fragmentary clay figurines of the Ur el-Obeid type. Some architectural information was also available.

The painted temple of the Uruk period was found on top of an irregular platform, approached by means of three staircases asymmetrically arranged but unmistakably representing a very early form of the Mesopotamian ziggurat. The temple plan itself recalls those of Warka and Khafajah. The complex was built of *riemchen* bricks, and had the niched wall effect and cone-mosaic wall decoration known on other contemporary buildings. The inner walls of the temple were covered with frescoes, this being the earliest example of this type of architectural decoration yet recovered anywhere. The range of colours was of considerable variety save for the absence of blues and greens. Both geometric and representational motifs were executed, the latter including a scene of the "temple herd," and of men wearing the knee-length skirt of early Mesopotamian type. The frescoes were all, unfortunately, fragmentary; one of the best preserved was that of the temple altar, which seemed to have been painted in front to imitate a miniature temple and was guarded on either side by representations of leonine beasts. The ceramic of this Uruk period temple complex included "votive bowls," crooked spouts and a few burnished sherds said to be of Uruk type.

It was to be hoped that work would proceed at Tell ʻUqair, where there was every indication for the recovery of a bulk of material from an apparently uninterrupted predynastic Mesopotamian sequence. (*c.f. Illus. London News*, June 27, 1942; *J. N. E. S.*, April 1943).

The second of the two outstanding reports on excavation to appear in 1942 was that published by M. Stekelis and Dr. William F. Albright (*B.A.S.O.R.*, No. 86, April 1942) on work in caves on Mt. Carmel, in Palestine. The really interesting material comes from a cave called Mughâret Abū Uṣbaʻ, where Stekelis made some small soundings in 1941, which yielded a sequence of Levalloiso-Mousterian, Upper Natufian-like and Recent materials. The total depth of deposit in the main sounding was only 0.70 mi.; but Stekelis was able to subdivide the middle layer (that with Upper Natufian material), and it was from these middle horizons that potsherds appeared in association with flints said to be of Upper Natufian type. Such an association would mean that the Upper Natufian would have to be reclassified as Neolithic rather than Mesolithic. Dr. Albright, on the other hand, was not satisfied with such an interpretation and suggested a date between that of Jericho IX (Late Neolithic) and the Ghassulian for the published flints, and an even later date for the potsherds. In actual fact, the potsherds (of which only a few were shown) are very enigmatic and present problems involving a possibly different stem from that of Jericho IX (*i.e.*, possibly the Byblos "sea cliff" material, also enigmatic). The flint industry, as described and incompletely pictured, would seem to correspond most closely to reports of certain inadequately published material from the cave site of el-Khiam, in Palestine. The whole Abū Uṣbaʻ assemblage (when fully described) may be found to refer to a coastwise culture of somewhat different aspect from that of Jericho and Ghassul in the Jordan valley. It seemed also quite possible that this material may be at least as early as that of Jericho IX. Such material was of extreme importance, since the real beginnings of the Neolithic economy in the near east were almost entirely unaccounted for in the available excavated materials.

The Palaeolithic-Mesolithic Periods.—The Abbé Breuil wrote a short note (*Nature*, 149, p. 77; Jan. 17, '42) on his impression of the new Sidi Abderrahman terrace sequence, from the Atlantic coast of Morocco. In this area, there is a clear succession of

Pleistocene terraces with associated fauna and human artifacts. Breuil correlated the highest (90 mi.) beach with pre-Günz times, the second (60 mi.) beach with the Günz-Mindel interglacial, the third (30 mi.) beach with the Mindel-Riss interglacial, and the lowest (15 mi.) beach with the Riss-Würm interglacial. Immediately overlaying the highest beach was an extensive workshop of large, heavy quartzite and sandstone flakes of Clactonian type, "roughly worked into bifaces." An Abbevillian (Chellean) industry of bifacially worked pebbles had previously been found on the 30 mi. beach; Breuil described these as heavily rolled, and believed that they were presumably derived from an older deposit. His brief correlation table listed both Abbevillian and Clactonian types as "pre-Günz," although the evidence for the placing of the Abbevillian here was not entirely clear from the note. To date, the earliest Abbevillian and Clactonian occurrences had been those of the 40 mi. Somme terrace in France, for which Breuil postulated a Günz context. Among other things, this new Moroccan material suggested that a detailed examination of the higher Nile terraces should be made, since little work had been done above the 30 mi. terrace in that area, and the contained implements were of Abbevillian type, but mainly rolled. Following the Clactonian at Sidi Abderrahman, Breuil listed some untypical flakes, and then a sequence of two stages of Acheulean, a Micoquean, a Mousterian and an Aterian industry.

In a report on the Pleistocene of Kenya Colony, Africa, P. E. Kent described the Kanam and Kanjera beds in some detail. This would not greatly affect the matter of the human remains found by Dr. Leakey, as their exact position was not established with certainty, but the geological deposits themselves were of considerable interest. Kent classified the Kanam beds as Lower Pleistocene, the Rawe beds as Lower-Middle Pleistocene and the Kanjera beds as Later Middle Pleistocene.

D. F. W. Baden-Powell and Reid-Moir suggested a new Palaeolithic industry, the Runtonian, from materials found mainly on the Norfolk coast of England. So far, the industry was said to have been found in the Croton Sands, the Chalky Boulder Clay (Riss ?), and the Briton's Lane Gravel. The flints consist mainly of small scrapers, points and racloirs. "Resolved" flaking was prevalent, and the flints were said "in some dim way" to foreshadow the High Lodge (Clactonian III) industry.

Various other Palaeolithic finds were briefly reported from England; from the foreshore and from plowed fields in the Worthing area by Frederick W. H. Migeod, and from Yorkshire, where they were evidently deposited immediately after the retreat of the last glacier, by Gibson. New Mesolithic materials were reported by Frere and Mrs. Piggott. A urus bone, inscribed with human figures, was said to have been found in a Danish peat bog, and was dated by pollen-analysis to about 6000 B.C. (Mesolithic).

Neolithic and Later.—Urns and cremation burials from Fife, in Scotland, which refer to the Bronze Age, were published in a note by V. Gordon Childe. Ritchie reported a lake dwelling or crannog in Loch Treig in Scotland; it was of rectangular plan and had been constructed of timber, earth and stones. It was suggested that the level of the lake must have been artificially reduced, in order to build it. A complete set of Iron Age arms was reported from Shövde, in western Sweden, and closer examination of the site revealed a cemetery with 22 tombs. A grave find of Roman glass and bronzes was said to have been made by workmen in Denmark.

The Near East.—In Egypt, three shaft tombs of the IV–V dynasties were reported by their Swedish excavators; all had been plundered in antiquity, but a valuable collection of the less spectacular types of objects was recovered. Troops near Cairo were said to have uncovered a mosaic floor. In Palestine and Trans-Jordan, the archaeological survey under Dr. Nelson Glueck, sponsored by the American school in Jerusalem and the Smithsonian institution, was being continued. In Jerusalem itself, city wall foundations of 4.0 mi. thickness, and two tower foundations, were excavated by the American school in collaboration with the Hebrew university. The complex was assigned to the Third Wall, built by Agrippa, and went a long way toward solving the question of the topographical position of the Third Wall. Workmen repairing a sidewalk in the old city of Jerusalem came upon the remains of a Roman aqueduct, the flagstones of a road 9.0 mi. wide, and house walls of massive stone units. The Hebrew University museum investigated a number of ancient Jewish burial caves in and about Jerusalem, and continued (under Prof. Sukenik) its work on the Bronze Age site of Tell Jerisheh, near Tel-Aviv. In the Lebanon, ruins of buildings, Phoenician glass, and some marble coffins were encountered by workmen in the Byblos district, during the preparation of the rail-line from Haifa to Tripoli. Australian sappers recovered a massive stone statue of a wolf, traditionally supposed to have guarded the pass, from the bed of the Nahr el-Kelb (Dog river). In Syria proper, an archaeological survey of the mounds in the Jabbul plain (east of Aleppo) was published in the *Palestine Exploration Quarterly* (April 1942); evidence to tie the plain into the relative chronologies of the surrounding areas in early times was recovered.

In Iraq, as well as the brilliant results from Tell ‘Uqair described above, a Directorate of Antiquities excavation under Sayed Fuad Sofar succeeded in tracing almost the entire plan of one of the earliest existing mosques and also found traces of the palace of Hajjaj, near Hai, in south Mesopotamia. In a higher stratum, some 400 little clay figurines of men, animals and birds were said to come from a toyshop of the time of the Mongols in Iraq. For Anatolia, Hamit Koşay reported on the continuation of the Turkish republic's excavations at Alaça Hüyük. Work was concentrated mainly on the Hittite levels, and it was shown that the gate of the sphinxes belonged to the late Hittite period. The Metropolitan Museum of Art (*Bull.* 37) presented an account of the results of its last two seasons at Nishapur, in Iran. The architectural evidence resulting from the clearance of a mosque, a palace and a bath was given, as well as a description of the antiquities these contained. The site was evidently occupied from the early 9th to the early 12th centuries A.D., and the material aided in elucidating the history of Persian painting and of Seljuk architecture.

Certain important books and articles concerned with the near eastern field appeared. Dr. D. E. McCown's *Comparative Stratigraphy of Early Iran* and his article in *J.N.E.S.*, "The Material Culture of Early Iran," went far toward bringing much needed order to the excavated materials available from various early Persian sites. McCown examined the antiquities from the earliest village horizons in great detail, and offered a scheme of correlation for this material with that of Mesopotamia. McCown was also to append a note on a forthcoming article by Brigadier E. J. Ross in *J.N.E.S.*, on the site of Rhana Ghundai in Baluchistan. The Brigadier's excavations at that site yielded material which since reached Chicago, Ill., and which was unique. The most recent publication of the Oriental institute's Iraq expedition appeared during 1942, *Pre-Sargonid Temples in the Diyala Region,* by P. Delougaz and Seton Lloyd. A stratigraphic scale for late prehistoric and early historic Mesopotamia is set by these public buildings and their interlocking sequences, the architectural details and the more important objects which the buildings yielded are presented, and the religious implications are drawn. An ingenious method of checking the dates of the buildings with the historical time scale is offered. In *Belleten* V (Türk Tarih Kurumu), Dr. Senyürek re-examined the available physical anthropological material for Anatolia, giving further substantiation to Dr. Krogman's view that the place of origin of the Armenoid physical type must be sought outside of the plateau, since early Anatolian skulls are mainly dolicho- or mesocephalic.

Greece and Italy.—The *A.J.A.* for 1942 contained notes on the principal finds and publications made within the field of classical studies during the year. Mrs. Blegen reported on discoveries made by the Germans at Olympia just before the war, which included the terra-cotta body of a Zeus figure, the head of which had been recovered in 1878. The god is represented as striding forward, carrying a boy (recognized as Ganymede), and was dated by Künze to about 490 B.C. Mrs. Van Buren's note from Rome told of a variety of recent finds in the Roman area, at Ostia and Paestum, and of Prof. Amedeo Maiuri's new volume on Pompei from the period of the earthquake to the final catastrophe.

U.S.S.R.—A considerable variety of very brief notes on recent finds in European and Asiatic Russia became available during 1942; they consisted of short statements such as that the palace of Ulugh Beg, grandson of Tamerlane, was found near Samarkand, that some 400 Mongolian and Tibetan manuscripts on wood appeared in the Buryat soviet, etc. Certain of these brief notices appeared in the "Archaeological news and discussions" in the *A.J.A.* Prof. Ellis Hovell Minns had a brief note on the report of Kuftin's work in Transcaucasia, in *Nature*. A variety of painted pottery, evidently of uncertain date, was found, and some was said to be strikingly like Hallstatt pottery in form and decoration. Perhaps the most useful item concerning Russia to appear during the year was the set of three articles (*Man,* 1942, 59–60, 74) by Childe which synthesizes the Palaeolithic and Mesolithic materials of the Caucasus and of the Russian plain, and which also brings the Copper Age materials of South Russia into somewhat clearer focus. Although none of the material covered in the articles was actually excavated in 1942, many relatively unavailable sources were drawn upon.

Far East.—The Archaeological department of the Indian government reported quartzite implements and microliths from the conglomerate in a river bed in the Sabarmati valley, Baroda. A note on two caves in Ceylon was available, where P. Deraniyagala found pygmy implements for the first time in association with a larger ground stone assemblage and a variety of bone tools. He suggested that the assemblage belongs to the upper level of the Balangoda phase.

Sources used in the preparation of this article, other than those specifically mentioned: *American Journal of Archaeology* (*A.J.A.*), *Antiquaries' Journal, Antiquity, Bulletin of the American Schools of Oriental Research* (*B.A.S.O.R.*), *Geological Magazine, Geographical Journal, Illustrated London News, Journal of Near Eastern Studies* (*J.N.E.S.*), *Man, Museum News, Nature,* the *New York Times.* (R. J. B.)

Archery.

Because of travel restrictions and other conditions, due to the war, The National Archery association (N.A.A.) did not hold its championship tournament in 1942.

In January, February and March, the N.A.A. sponsored the 15th annual series of ten indoor mail matches of the Olympic Bowmen league in which nearly 400 archers took part. The Cleveland Archery club of Cleveland, Ohio won first place in this event in both the men's and women's divisions.

In May the N.A.A. sponsored the 13th annual Women's Intercollegiate Archery contest in which 104 teams (8 archers to a team) representing 70 colleges participated. The total number of individuals shooting in this event was 834. First place was won by Team 1 from University of Connecticut, Storrs, Conn., second place going to Team 1 from Los Angeles City college, Los Angeles, Calif.

In August the N.A.A. conducted a Nation-Wide Mail match in which over 1,000 archers took part. In this event tournaments were held by the various archery clubs throughout the country within a specified time period, at which the prescribed rounds were shot. The results were sent to N.A.A. headquarters for tabulation. This event was won by Carl J. Weese, Newark, N.J in the men's division, by Mrs. S. Robert Leaman, Bird-in-Hand, Pa. in the women's division, by John Mahoney of San Diego, Calif. in the boys' division and by Maryellen Bramlet, Peoria, Ill. in the girls' division. Mr. Weese turned in a score of 140–930 for the single York round and a score of 90–710 for the single American round. Mrs. Leaman's score was 72–508 for the single National round and 72–588 for the single Columbia round. John Mahoney made a double Jr. American of 179–1463 and Maryellen Bramlet turned in a score of 144–1064 for the double Columbia round.

In October the N.A.A. sponsored a Nation-Wide Flight shoot by mail which was won by Charles A. Pierson, Cincinnati, Ohio in the regular style event with a shot of 489 yds., 5 in., and by Mike Humbert, Springboro, Ohio in the Free Style event with a shot of 524 yds., 2 ft., 8 in.

The National Field Archers association conducted a series of Field Archery events by mail. (L. C. S.)

Architecture.

Architecture reflects the social conditions of an age. During the year 1942 civil building was completely halted and all building activities were devoted to the needs of the armed forces, the production of war materials, the housing of war workers and the most urgent requirements for the safety, health and welfare of the civilian population. Architecture became utilitarian in character. Its visual form grew out of the temporary nature of buildings designed for the duration of the war, out of shortages in materials and manpower and out of the speed and efficiency demanded by the war effort. Air-raid protections, such as camouflage and blackouts, also had their influence on architectural design. Prefabrication progressed as a means toward speedy construction and the conservation of materials. The many large projects built demanded the architectural services of large organizations or government bureaus. The work of architects with a small practice, catering to individual needs, was greatly curtailed.

Interesting developments grew out of material shortages; the rigorous conservation enforced by governmental control changed construction methods and demanded the development of substitutes. Many projects, including housing schemes, had to be held in abeyance.

Postwar planning received ever-increasing attention. The social changes, accentuated by the war, combined with the inventions which an intense period of research stored up for peacetime usage, foreshadowed the architectural developments of the future.

Censorship and the absence of a free international exchange of literature made a complete evaluation of architectural progress during the fourth year of World War II impossible.

Planning and Design.—Architectural design of buildings designated to the war effort demanded expediency in the co-ordination of diverse technical problems encountered in modern planning procedure. Plans for the execution of industrial buildings had to grow out of the flawless team work of many specialists so that projects of large size could be carried out in an unusually short time. The accomplishments of large organizations in this direction, combined with the difficulties of the small practitioner to remain employed, foreshadowed changes in the profession. A questionnaire prepared by the *Architectural Record* showed that a large number of architects anticipated that additional services, such as full responsibility for structural and mechanical engineering, furnishings and landscaping, etc., would be demanded of

INTERIOR of the Tabernacle Church of Christ, Columbus, Indiana. The architects, Eliel and Eero Saarinen, purposely avoided symmetry in the design

architects in the future.

Many architects were engaged in civilian defense, dealing with blackout provisions, camouflage, building protection against air attack and planning for evacuation in case of air raids.

In *Factory Design,* windowless, as well as daylight plants, were built, with the former gaining in favour. Enemy attack by air constituted an important factor affecting the design. Conservation of materials became a necessity. The trends established in previous years toward greater speed of construction and increasing plant efficiency, productivity and working comfort were carried forward vigorously. In column spacing, the most notable accomplishment was an increase in the span of girders. One of the aircraft plants of the United States attained an unbroken floor area of five acres, 300 ft. in width.

In *Housing,* it also became mandatory to stretch materials and manpower to the utmost. Again, all buildings had to be designed for rapid construction. In the United States, foot travel had to be considered in the site location due to the shortage of gasoline and tires. There was a shift from individual houses for married workers to dormitories for men and women.

Some 16 housing agencies of the United States government were brought together under the newly established National Housing agency. (*See* HOUSING; NATIONAL HOUSING AGENCY.)

The design for houses of the postwar period was considered in a special number of the *Architectural Forum.* It was recognized that the end of the war would bring about vast changes in daily living and would affect the habits of consumption and the methods of production, which would result in new designs. Proposals for the latter centred about systems for complete prefabricated houses or parts thereof, labour-saving devices for the home and utilization of new materials.

Postwar planning received particular attention in Great Britain where the bombings of previous years made the adoption of plans for reconstruction more urgent. The need for a centralized planning authority was understood and accepted; a ministry of reconstruction and a ministry of works and planning were set up. The vital questions of the decentralization of industry, the future of the great towns and the amount of national financial assistance toward replanning received attention. Plans for the reconstruction of bombed cities, such as London and Coventry, were made.

In the United States, the recommendations of the national committee on the housing emergency called attention to the coming era of building, which governmental and private groups, engaged in postwar economic planning studies, looked forward to as the most important source of postwar employment. New York city authorized a planning fund to launch studies and surveys for its postwar construction program. (See TOWN AND CITY PLANNING.)

Materials and Methods.—The shortages in metals caused far-reaching changes in structural design. Wood and reinforced concrete were used in place of steel; later in 1942 it became apparent in the United States that even timber had to be conserved with utmost caution. For the construction of wooden girders, plywood, laminated beams and arches or I-beams built up of timber were used. Timber frames were often pressure-treated for fire resistance. Wood also replaced steel in factory windows and miscellaneous equipment (lockers, storage bins, etc.). Many patented structural systems were brought from Europe to America because these conserved materials in a way that had hitherto been unnecessary in the United States. Asbestos and plastics were used as substitutes for metal pipes, and plywood and wallboards served in place of sheet metal. Steel replaced the scarcer brass in hardware and, also, thermoplastic materials were moulded with steel inserts for this purpose. A plastic wire-mesh window pane for steel or wood sash was advocated for greater durability. Foamglas, a newly invented type of cellular glass, came into use as an insulant in low temperature work, an insulating medium for roof construction, and for various insulating and flotation purposes by the United States navy. In place of metal flashings, saturated felt or cloth was used.

All critical materials were controlled by the governments. The War Production board of the United States issued preference ratings for the purpose of facilitating the acquisition of certain material which had to be used in the public interest and to promote the national defense. Practically no construction could be undertaken without a governmental priority rating on the critical materials involved.

Fluorescent lighting continued to be a vital factor in design. In some instances cold cathode (high tension fluorescent) lighting was used in preference to hot cathode because of the smaller amount of critical materials involved in the equipment and installation. (*See* ELECTRICAL INDUSTRIES.) The windowless plants used prefabricated and completely insulated wall panels for the exterior walls and partitions and thereby speeded construction. A trend toward wider application of air conditioning continued. White cement floors with light panels were introduced into plants where work under the wings of aeroplanes had to be performed. Recent progress in acoustical treatment demanded the development of a revised set of standards for the design of the new studios for the National Broadcasting company in New York. In prefabricated house construction in the United States 42,000 units were completed by the early summer of 1942, in contrast to 10,000 units produced between 1931 and 1940.

Examples.—In the *United States,* the volume of all construction soared to record heights due to large governmental financing of public construction; however, private building became greatly reduced over the preceding year. (*See* BUILDING INDUSTRY.) Much of the planning and design was undertaken in the offices of the armed services and the various governmental agencies. The army engineers completed in Washington, D.C., the Pentagon building with five stories connected by ramps, providing offices totalling 4,000,000 sq.ft. of floor area; it was planned and built of reinforced concrete and stone veneer in 15 months. The army engineers also completed in 60 days a total of 191 recreational buildings for the United Service organizations, which were for the most part based upon seven standard plans. The Willow Run bomber plant of the Ford Motor company in Michigan became one of the largest industrial projects hitherto undertaken. The firm of Albert Kahn, associated architects and engineers, planned this semi-blackout factory. In the southwestern part of the

United States, the Austin company built a four-motor bomber plant of gigantic dimensions. The wall and roof surfaces of this windowless factory were lined with a material which accomplished both thermal insulation and sound absorption.

Housing for war workers consisted not only of dwellings but also of community buildings for administration and recreation, stores, schools, etc. The housing project at Center Line, Mich., Eliel and Eero Saarinen, architects, Robert F. Swanson, associated architect, showed a skilful architectural expression of the rigid economies mandatory for wartime construction. An excellent school is the feature of this project. "Duration dormitories" later became the more common type of housing. The two-story plywood structures of the Farm Security administration at Vallejo, Calif., Vernon De Mars, architect, are examples. Less of the influence of war economies and expedients could be detected in the designs for the Thomas A. Larken school at Monterey, Calif., R. B. Stanton and T. B. Mulvin, architects; and the Sears, Roebuck stores in Washington, D.C., J. S. Redden, architect. Both expressed the more popular style of civilian building carried over from the end of peacetime. A noteworthy monument of modern architecture was the Tabernacle Church of Christ, at Columbus, Ind., Eliel and Eero Saarinen, architects, E. D. Piere and G. Wright, associated architects. Greatest economy in schoolhouse design was accomplished in the prefabricated schools built by the Federal Works administration at Carquinez Heights, Vallejo, Calif., and Pacific Beach, San Diego, Calif., Franklin & Kump, architects. The imaginative and ingenious system of prefabrication and construction created the aesthetic appeal of these rambling structures, consisting of one-story classrooms connected by open porches and timber arch-rib roofed auditoriums.

In *Great Britain,* plans for the reconstruction of bombed towns were made. In the case of London, attention was drawn to a master plan prepared for the rebuilding of the city by the Modern Architectural Research (M.A.R.S.) group, and, later, to pictorial illustrations accompanying the designs for the future capital of the empire by Sir Edwin Lutyens, architect, and Sir Charles Bressey, planner, prepared under the sponsorship of the Royal academy. Examples for housing schemes can be seen in the estates by G. A. Jellicoe, executed in collaboration with D. W. Plumstead and Anthony Pott. These architects were commissioned by the ministry of supply to plan seven groups of homes for factory workers in different parts of the country.

In *Canada,* the largest expenditure and the greatest activity were in industrial expansion. One of the largest aluminum plants in the world was constructed at Arvida and a large automatic gun plant was built in Toronto. With the limitations imposed on the use of metals, the aircraft plant by Carter-Halls-Aldinger Co., Ltd., D. Colville, architect, resorted to all wood construction with timber trusses and plywood walls.

In *South America,* the problem of dealing with the intense rays of the sun gave unusual design characteristics to many new buildings. In Rio de Janeiro, Brazil, office buildings had exteriors consisting of a grid of vertical and horizontal fins which shaded the windows from the east and west, as well as the north sun. A similar motive constituted the façade of a large building at the Santos Dumont airport, Rio de Janeiro; this served as a frontispiece to an unusual cantilever roofed hangar with trusses exposed on the outside. (*See* also BUILDING INDUSTRY.)

Archives, National.

The National Archives was established by an act of Congress approved June 19, 1934. Its primary objective is to make the experience of the American government and the American people as it is embodied in noncurrent records of the federal government available to guide and assist the government and the people in planning and conducting their activities. This is accomplished by selecting, assembling, preserving, organizing, and making available for use the noncurrent records of the United States government that have permanent value.

There were in 1942 about 500,000 cu.ft. of records in the custody of the archivist of the United States. These included approximately 80% of all federal records in the District of Columbia that are more than 50 years old, exclusive of those of the General Accounting Office. The total quantity of records accessioned during the fiscal year ending June 30, 1942, amounted to 159,774 cu.ft.

A special function of The National Archives is the daily publication of the *Federal Register,* which contains all current administrative orders, rules and regulations issued by federal agencies that have general applicability and legal effect, including many documents on priorities, the selective service, export control, and other phases of the war effort.

The Franklin D. Roosevelt Library at Hyde Park, which is administered by the archivist of the United States, was dedicated to the service of the nation by the president of the United States on June 30, 1941. The museum portions of the building were open to the public and the library continued to assemble and arrange the papers of the president and his associates. (S. J. BU.)

Argentina. A republic on the Atlantic coast of southern South America and second largest country of the continent; language, Spanish; capital, Buenos Aires; president in 1942: Dr. Ramón Castillo. Area, 1,079,965 sq.mi. The religion is Roman Catholic.

No official census had been taken since 1914, but official estimates placed the population at 13,518,239 as of Dec. 31, 1941. According to an estimate of 1940, native-born persons of European stock aggregated 76.9%, mixed bloods 3.2% and foreign born (almost entirely European) 19.9%. A majority of the population is of pure Spanish stock, nearly one-third is Italian or part Italian, and an estimated 250,000 are German or part German. Buenos Aires had a population of 2,515,729 (1941 municipal census), or 3,700,000 with its suburbs. Other cities (with est. pop.) include: Rosario (540,000); Avellaneda (suburb of Buenos Aires) (386,000); La Plata (248,000); Córdoba (273,852); Santa Fé (150,000); Tucumán (149,214); Bahía Blanca (115,000); Mendoza (111,279); Paraná (80,000).

History.—Argentine history in 1942 was marked by sharp controversy in domestic politics, mainly over foreign policy and the continuation of the state of siege which, with its suspension of constitutional guarantees, had allegedly curbed activities of anti-administration groups since Dec. 16, 1941. In foreign affairs, Argentina maintained a cautious neutrality, but declared adhesion to principles of American solidarity.

The confused political situation resulting from President Roberto M. Ortiz's surrender, in July 1940, of actual executive power to Vice-President Ramón Castillo, was clarified by Ortiz's resignation on June 27, 1942. Some three weeks after his official retirement Ortiz died. Meanwhile, the Conservative group supporting Acting President Castillo gained a plurality in the chamber of deputies in the elections held March 1. The Radical (*i.e.,* Liberal) party, the major opposition group, although thus deprived of the majority which it had enjoyed in 1941, could still, by combining with the other important opposition party, the Socialists, control the chamber. The strongly Conservative senate, however, could block any opposition measure.

Attacks on two Argentine ships by German submarines gave force to the opposition's bitter criticism of Castillo's neutrality. On April 17 the S.S. "Victoria" was damaged off the North American coast. After secret investigations by the foreign office, it was announced that the damage was accidental and was due to an "internal explosion of undetermined origin," but on June 17 the foreign office reported the receipt of a nazi apology for the attack upon the vessel. Five days later came notification of the sinking of the "Río Tercero," 120 mi. from New York city, and on June 26 a vigorous protest was made to Germany, calling for payment of damages, a salute to the Argentine flag and a guarantee that Argentine neutral rights would be thenceforth respected. Nevertheless, upon delivery of Germany's reply, announced July 6, the government accepted the German excuse of mistaken identity, agreed to waive the salute to the flag, and undertook to provide Germany with information on Argentine ships and sailing dates to prevent further incidents. Upon the announcement of the German blockade of eastern North America, Argentine ships were rerouted to gulf and Pacific coast ports. In the chamber of deputies, these developments brought vigorous criticism, and, before adjourning on Sept. 30, the chamber voted, although by a narrow margin, to sever relations with the axis powers. In view of the senate's Conservative composition, this action was but a gesture.

Meanwhile, within the limits of Argentine neutrality, the Castillo administration took various steps toward closer co-operation with western hemisphere nations and toward improvement of its own national security. In June the government issued various decrees to enforce economic and financial control measures recommended by the Río Conference of Foreign Ministers. With Brazil's declaration of war on Germany in August, Argentina proclaimed Brazil a nonbelligerent and stated that she would grant all facilities necessary to the defense of Brazilian interests. Throughout 1942, closer relations with other Latin-American states were encouraged.

In Oct. 1942 government action against axis agents and for hemisphere defense were accelerated by the Boston speech of United States Assistant Secretary of State Sumner Welles, who declared that the two Latin-American countries (Chile and Argentina) which had not broken relations with the axis were centres of espionage against the United Nations. Argentina protested on the grounds that she should first have been shown the evidence supporting his allegations, but when that evidence was presented, the government instituted an immediate investigation. As a result, 38 persons were arrested on charges of espionage and 6 of them jailed. Following the Anglo-U.S. invasion of North Africa in November, Foreign Minister Enrique Ruiz Guiñazú expressed, in a cable to United States Secretary of State Cordell Hull, Argentina's "solidarity" with the United States.

Meanwhile the impact of war on Argentine economy forced the adoption of measures to conserve domestic supplies of essential materials, including the rationing of automobiles, rubber products, newsprint and fuels. The continued rise in the cost of living also drew the attention of the government.

In Sept. 1942 the political tension was increased when Pres. Castillo, on his return from the Bolivian border, announced "enormous popular enthusiasm" for his policy of neutrality, while ex-

President Justo made a dramatic flight to Brazil to place himself at that country's service in its war against the axis. On Oct. 5 Pres. Castillo intervened in Corrientes province, and, on grounds of maladministration, removed the pro-Justo government. Shortly thereafter, confirming persistent rumours of an impending cabinet shakeup, Minister of War Juan N. Tonazzi, reputedly sympathetic with Justo, submitted his resignation.

Education.—Education is free and compulsory. In 1941 there were 14,059 elementary schools, with 2,005,462 enrolment; approximately 48% of these were under complete federal control, the remainder under provincial, with federal support, however. An additional 1,167 private schools (as of 1939) had an enrolment of 139,917. Secondary schools of all types numbered (as of 1940) 445, and had 75,903 pupils. One private and six national universities had enrolments totalling nearly 30,000.

Defense.—Military or naval service is compulsory. The standing army in 1941 was estimated at 45,000, with potential reserves of 281,000. The navy comprised 2 battleships, 3 cruisers, 16 destroyers and 3 submarines. Air strength was around 300 planes. Modern equipment was, however, almost entirely lacking in 1942.

Finance.—The monetary unit, the peso, had an official exchange value of 26.8 cents U.S. and an unofficial rate of approximately 23.75 cents U.S. in 1942. Budget estimates submitted to congress in Sept. called for expenditures of 1,217,000,000 pesos in 1942 and 1,204,000,000 pesos in 1943, of which about 23% was to go to education and 20% to national defense and police. Revenues (largely from customs) totalled 958,446,000 pesos in 1941 and were estimated at 988,000,000 for 1942 and 1,040,000,000 for 1943.

The public debt on June 30, 1940, totalled 7,724,535,000 pesos (national, 5,291,382,000; provincial, 1,584,408,000; municipal 848,745,000), of which 1,952,998,000 pesos, including $190,500,000 in U.S. dollar bonds, were internal. The national treasury, as of Dec. 31, 1940, had assets of 228,808,000, liabilities of 916,038,000, and a floating debt of 687,230,000 pesos.

Trade and Communication.—Argentine imports in 1941 (provisional figures) totalled 1,276,654,533 pesos, a 14.8% decline from 1940; exports were 1,464,621,550, a 2.6% gain. Principal imports in 1941 were: fuels and lubricants 17.4% (1940: 17.5%), textiles 15.8% (17.4%), chemicals and pharmaceutical products 10.9% (8.5%), foodstuffs 7.7% (7.2%), iron and iron goods 7.3% (9.2%), machinery and vehicles 6.9% (9.9%), metal goods except iron 6.7% (6%), paper goods 5.9% (5.8%). Meat and livestock products contributed 62.1% of the value of exports (1940: 49.1%). Chief export items were, in value: meats 26.4% (1940: 21.5%), wool 16.3% (13.7%), hides 10.1% (8%), wheat 10.7% (19.9%), linseed 4.5% (8.4%), quebracho extract 1.9% (2.1%), oils (except linseed) 2.8% (1.2%), mineral products 2.2% (1.5%), textiles 1.7% (0.6%).

In the first eight months of 1942, imports increased 22.1% in value; in the first seven months, exports increased 12% over the total for the same period of 1941.

In 1942, 45,780 km. of railroads (12,702 km. state-owned in 1941) were in operation. An Argentine government-financed rail line into the Bolivian oil fields (begun in 1941) was in process of construction in 1942.

Air transport by Pan American Airways, providing extensive service to all parts of America, was greatly expanded in 1942. In September, a new daily service was instituted from Buenos Aires to the United States by way of Salta and the west coast of South America. The Argentine merchant marine aggregated some 300,000 gross tons in 1941, most of it state-owned.

THE TANKER "VICTORIA" was the first Argentine ship to suffer damage in World War II. An explosion, presumably caused by a torpedo, stove in its side plates off Cape Hatteras April 17, 1942

In 1942 there were 21,456 km. of national roads, 29,143 km. of provincial roads built with national assistance, and 9,857 km. of roads leading to railway stations.

Agriculture.—Argentina's resources are principally agricultural and pastoral, with 10.8% (74,130,000 ac.) and 44.4% (306,404,000 ac.), respectively, of the country's area devoted to them in 1941. In 1942–43 the area devoted to principal crops (in hectares; 1 hectare = 2.471 ac.) was wheat 6,400,000; maize 5,000,000; linseed 2,465,000; oats 1,343,000; rye 975,000; barley 747,000; birdseed 50,000; rice 33,400 (1941–42); sugar cane 188,714 (1939–40); vineyards 137,934 (1939–40); cotton 336,600 (1940–41); sunflower seed 750,000; alfalfa 5,402,400 (1939–40); potatoes 241,800 (1940–41). Cereal and linseed acreage, which decreased in all cases, totalled 16,981,000, 12% less than in 1941–42. Tonnage produced (official estimate) was: wheat 6,200,000; linseed 1,670,000; maize 9,500,000; oats 470,000; barley 383,000; rye 160,000; birdseed 27,000; sugar cane 5,835,075 (1939–40); cotton 76,500; sunflower seed 670,000; rice 57,000 (1940–41); potatoes 1,400,000; grapes 953,866 (1939–40).

While the vast majority of animals of the pastoral industry were intended for slaughter, the Argentine dairy industry grew more important in 1941 and 1942, and in 1941, 67,428,000 pesos worth of dairy produce was exported, chiefly in the form of butter and casein.

Manufacturing.—Manufacturing underwent extensive development after 1935. Comparative figures from the 1939 and 1935 industrial censuses showed a 32.7% increase in the number of establishments (to 53,866) and 31.1% in number of workers (to 618,792). Subsequently, a probably much greater increase took place.

The chief production is in foodstuffs, textiles, forest products, paper, printing, chemicals and pharmaceuticals. Practically all manufacturing was for domestic consumption.

Mineral Production.—Argentina ranked 11th in the world production of petroleum in 1941, with a production for that year of 3,499,757 metric tons, 63% of which came from state-owned wells. Approximately 75% came from the Comodoro Rivadavia fields in Chubut territory (in southern Patagonia), the rest from Neuquén territory and Salta and Mendoza provinces, along the Andean foothills.

In 1942 a new field was discovered in Calluco.

(R. H. Sh.; C. N. G.)

Arizona. The "Apache state" lies in the southwestern part of the United States of America. It borders Mexico on the south; the Colorado river forms most of the western boundary. By federal census of 1940, the area is 113,580 sq.mi.; pop. 499,261, 65.2% rural and 34.8% urban. Native and foreign-born whites (including Mexicans) numbered 389,955 and 36,837 respectively; Negroes, 14,993; other races (mostly Indians), 57,476. The capital is Phoenix, with a population of 65,414. Chief cities are Tucson (36,818); Douglas (8,623); Mesa (7,224); Globe (6,141); Prescott (6,018); Bisbee (5,853); Yuma (5,325) and Flagstaff (5,080).

History.—The state officials in 1942 were: chief justice, Alfred C. Lockwood; governor, Sidney P. Osborn; secretary of state, Harry M. Moore; attorney-general, Joe Conway; treasurer, Joe Hunt. All were re-elected at the Nov. 1942 election except Joe Hunt, who was elected state tax commissioner; J. D. Brush was elected treasurer. Secretary of state Harry M. Moore died after the November election and was succeeded by Dan E. Garvey, appointed by the governor. A special war session of the 15th state legislature was called for April 6. Several measures were passed, including a bill providing for a civilian defense board and a defense council.

Education.—According to the report of 1940–41, the average daily attendance and the number of teachers in the public schools stood, respectively, as follows: elementary schools, 70,751 and 2,500; high schools, 18,394 and 815. In addition there were 58 private and parochial schools.

Public Welfare, Charities, Correction.—In Nov. 1942, there were 36,091 persons receiving assistance from the state department of social security and welfare, with a total state expenditure for the month of $288,899. State appropriations for 1942 were as follows: industrial school $53,920; juvenile girl offenders $50,000; pioneer home $74,830; prison $181,540; state hospital for insane $292,625 (to this was added $67,789 at the special session); school for deaf and blind $81,970.

Communication.—There were 3,473 mi. of improved state highway and 202 mi. unimproved as of Dec. 31, 1941. The total railroad mileage in the state on the same date was 2,180 mi.

Banking and Finance.—National banks in 1942 had deposits of $87,864,000; loans and discounts of $29,678,000; investments of $24,999,000. State banks had deposits of $34,665,000; loans and discounts of $11,649,000; investments of $12,229,000.

Agriculture.—To meet the labour shortage in 1942, school children, college students, women and professional men went out from town to pick cotton whenever possible.

Leading Agricultural Products of Arizona, 1942 and 1941

Crop	1942 (est.)	1941
Wheat, bu.	462,000	392,000
Oats, bu.	270,000	256,000
Sorghum grain, bu.	1,440,000	1,829,000
Corn, bu.	410,000	451,000
Cotton lint, bales	194,000	181,000
Grapefruit, boxes	2,835,000	3,450,000
Oranges, boxes	700,000	660,000
Horses, head	74,000	74,000
Cattle and calves, head	950,000	916,000
Sheep and lambs, head	767,000	763,000

Manufacturing.—Less than 10% of the population was engaged in manufacturing in 1942. The most important industries were food, textile, metal and lumber products.

Mineral Production.—The mine production of copper for 1941 was 665,500,000 lb. Production for 1942 was estimated to be higher than that of any previous year. (H. A. H.)

Arkansas. In the south-central U.S., Arkansas was the 25th state admitted to the union (1836). Its older popular name is "Bear state," the newer (by resolution of the legislature), "Wonder state." Area, 55,336 sq.mi.; pop. (1940) 1,949,387. The population is predominantly rural, although the 1940 census showed a slight movement to the cities, the urban population having increased from 20.6% in 1930 to 22.2% in 1940. The white population was 1,466,084; Negro, 482,578; other races, 725; foreign born, 7,692. Only 3,210 aliens registered in 1941 under the federal law. The capital is Little Rock (88,034). Other cities are Fort Smith (36,584); Hot Springs (21,370); Pine Bluff (21,290); North Little Rock (21,137); El Dorado (15,858); Texarkana (11,821).

History.—Homer M. Adkins, Democrat, was re-elected governor in the election of Nov. 3, 1942. The following other state officials, all Democrats, were elected to take office in Jan. 1943: J. L. Shaver, lieutenant governor; C. G. Hall, secretary of state; Guy E. Williams, attorney general; J. O. Humphrey, auditor; Earl Page, treasurer; Claude E. Rankin, land commissioner. Three new members were elected to the supreme court, Ben E. Carter, Edward F. McFaddin, R. W. Robbins. Two new members were sent to the house of representatives, J. W. Fulbright from the third district and Brooks Hays from the fifth. John L. McClellan was sent to the senate. Although about 300,000 had paid the poll tax, fewer than 100,000 went to the polls. The main reason was that the Republicans did not put out an opposition ticket. The vote was heavier in the August primaries. In the first primary there were four candidates for the senate. In the run-off J. L. McClellan defeated Jack Holt by a large majority, partly, it was believed, because the governor announced his support of the latter. Four amendments to the constitution, one referred act and one initiated act were submitted to the electors. Two amendments were adopted, one to allow counties to support hospitals by taxation and the other to "freeze" boards of state institutions and to "stagger" terms so as to make it impossible for the governor to get control. The initiated act reducing the number of signatures required to submit a local option measure was adopted. The referred "lawyers bill" to require the employment of lawyers in certain cases was defeated.

The public utilities commission ordered the Arkansas Power and Light company to refund $625,000 to its patrons in 1942. The company contested the order in the circuit court, lost, and did not appeal. The $35,000,000 24-inch oil pipe line, crossing Arkansas from the southwest to the northeast, lacked only a few miles of being completed at the close of 1942. The aluminum plant situated near Lake Catherine went into operation in 1942, making aluminum out of ore mined a few miles away. Arkansas could now produce 180,000,000 pounds a year. Sour gas from south Arkansas was being used for fuel in the aluminum plant. Arkansas secured several war industries, army camps and flying fields at a cost, according to Governor Adkins, of $350,000,000. Two colonies of Japanese who had been evacuated from the west coast, were established in Arkansas. A Negro who had been indicted by an all white grand jury secured a reversal from the state supreme court. He was then indicted by an all Negro grand jury and was convicted. The state supreme court sustained the conviction and the United States supreme court refused to review the case.

Education.—The enrolment of the public schools for 1941–42 was: grades one to eight, 329,123; grades nine to twelve, 67,777; a total of 397,369; teachers numbered 13,066; expenditures, $16,062,023. The impact of the war was felt on the teaching force, leaving 895 positions unfilled and 275 discontinued. Approximately 300 emergency permits were issued.

Public Welfare and Charities.—The total federal expenditures for relief in Arkansas from 1935 to the close of 1941 amounted to $197,600,000, of which $21,724,209.21 was spent during the fiscal year of 1941. Relief expenditures by the State Welfare department for the fiscal year ended June 30, 1942, were $4,080,095.76. The largest item was for old age assistance, $2,402,348 equally divided between state and federal funds. In addition some 60,000 persons received food stamps.

Communications.—The state had 9,289.3 mi. of highways in 1942, of which 1,242.7 were concrete, 486.8 asphalt, 1,357.1 bituminous, and 5,575.8 gravel. New construction was practically stopped by the war. The railway mileage was 4,538.

Banking and Finance.—State banks and trust companies numbered 166 in 1942; building and loan associations, 8. The resources of the former amounted to $142,710,657 as of June 30; deposits as of Dec. 31, 1942, $174,060,395; loans, $32,000,000; U.S. bonds, $47,258,578. Total resources of the latter, $3,098,005. The national banks numbered 50 with assets of $188,576,000; deposits, $175,424,000.

The state debt was reduced only $1,000,750 in 1942, bringing it down to $145,925,524. The state income tax increased 146% in 1942, the highest increase of any state in the union. The income tax paid to the nation was $8,476,000.

Agriculture.—The total farm value of 34 important Arkansas crops in 1941 was $235,192,000, compared with $169,000,000 in 1940. A preliminary survey gave a valuation of $282,423,000 for the crop of 1942.

A cattle show at Little Rock revealed great strides in that industry.

Table I.—*Leading Agricultural Products of Arkansas, 1942 and 1941*

Crop	Production	
	1942 (est.)	1941
Cotton, bales	1,600,000	1,450,000
Corn, bu.	35,785,000	46,032,000
Rice, bu.	14,204,000	10,918,000
Soybeans, bu.	3,336,000	2,854,000
Peaches, bu.	2,337,000	3,042,000

Manufacturing.—In 1939, the industries of Arkansas turned out products valued at $160,166,984 and employed 39,438 persons to whom they paid wages of $30,787,479.

Table II.—*Principal Industries of Arkansas, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Sawmills and kindred works	$35,222,273	$35,963,098
Cottonseed oil, etc.	17,340,538	14,383,526
Petroleum refining	14,327,824	21,320,560
Nonalcoholic beverages	5,632,283	878,381
Household and office furniture	5,441,196	6,627,435
Bread and bakery products	4,910,418	5,384,284
Newspaper publishing and printing	3,848,381	3,661,977

Mineral Production.—In 1942 a new deposit of bauxite was discovered, estimated to be 4,000,000 to 5,000,000 tons. The war stimulated mineral production considerably. In 1940 the value was $33,705,929.

Table III.—*Principal Mineral Products of Arkansas, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Petroleum	$21,239,515	$16,931,240
Coal	4,480,713	4,103,020
Bauxite	2,804,144	2,293,455
Manganese	126,299	89,178
Natural gas	578,808	545,936
Natural gasoline	520,669	754,709

(D. Y. T.)

Armies of the World. Because of the military need for censorship, no current data, official or otherwise, is available covering the statistics of this subject. The usual article is therefore omitted for the duration of the war. (For related topics *see* AIR FORCES OF THE WORLD; MUNITIONS OF WAR; SELECTIVE SERVICE; WORLD WAR II.)

Arnold, Bion Joseph (1861–1942), U.S. electrical engineer, was born Aug. 14 at Casnovia, Mich. He received his E.E. degree from the University of Nebraska in 1897. Arnold built the "intramural railroad" at the Chicago World's fair in 1893, the first commercial application of the electric third rail to railroading in the United States. He later devised the plan to electrify all railroads running into the Grand Central station in New York City, thus eliminating much of the city's smoke nuisance. Arnold was chief consulting engineer of Chicago, 1902–07, and was in charge of construction of the city's street railways after 1907. He was president of the American Institute of Electrical Engineers, 1903–04. He died in Chicago, Ill., Jan. 29.

Arnold, Henry H. (1886–), U.S. army officer, was born June 25 in Gladwyn, Pa. He was graduated from West Point in 1907 and served in the Philippines until 1909. He set an altitude record in 1912, and was the first aviator to use radio in reporting artillery fire observed from a plane. During World War I he headed the information service of the signal corps's aviation division. Gen. Arnold led a round-trip flight of army bombers to Alaska in 1934. He was named major general, chief of the air corps, 1938. In Oct. 1940, he became the nation's first acting deputy chief of staff in charge of co-ordinating all matters pertaining to the air corps. In May 1941 Pres. Roosevelt made him a full-fledged deputy chief of staff, and on Dec. 15, 1941, the president named him for temporary promotion to the rank of lieutenant general.

In March 1942 Arnold was made commander of the air force, which was put on an equal footing with the ground forces. In July 1942 he announced the existence of a "troop carrier command," equipped to transport air-borne soldiers for offensive operations, and on Dec. 13 he asserted that the U.S. had a "secret weapon or two," which would deal paralyzing blows to the axis.

Arsenic. Production of white arsenic in the United States in 1941, including 6,123 short tons of crude and 28,661 tons of refined, totalled 34,784 tons, an increase of 49% over 1940 and a new record high. Consumption increased 28% to 40,442 tons. Increased demands indicated a shortage in 1943 unless production facilities were increased. Mexican production was reported at 9,628 metric tons in 1940 and 12,844 tons in 1941, most of which went to the United States, which would indicate an increase in the United States imports over the 9,929 tons received in 1940, although this was not shown in the 7,578 tons received in the first nine months of 1941, the agreement for the increase in Mexican deliveries not having gone into effect until September.

Art: *see* AMERICAN LITERATURE; ARCHITECTURE; PAINTING; SCULPTURE; etc.

Art Exhibitions. War themes were prominent. Outstanding examples were two poster exhibits and the stirring Road to Victory (with Sandburg's text and photographs chosen by Lieutenant Commander Edward Steichen) at the Museum of Modern Art. The most significant contemporary art event of the year was the Metropolitan museum's Artists for Victory, with awards of $52,000 in purchase prizes. A number of benefit exhibitions were held for worthy causes: most important, Great Dutch Masters for the benefit of the Queen Wilhelmina fund and the American Women's Voluntary Services, seen first at Duveen's and then, with omissions and additions, at the Art Institute of Chicago. The Downtown gallery featured the work of Kuniyoshi for the benefit of United China Relief. Knoedler's showed early Flemish painting for the benefit of the Society for Aid to Belgian Seamen; Parke-Bernet's delightful display of French and English 18th century art was held for the benefit of the American Women's Voluntary Services. Particular stress was laid on the art of the Americas in several noteworthy events such as the comprehensive showing of pre-Columbian sculpture at the Santa Barbara Museum of Art and Chilean Art Today, brought to the United States by the Co-ordinator of Inter-American Affairs and seen at the Toledo Museum of Art. Folk art of the Americas was on view at New York's Downtown gallery.

Exhibitions centring around special themes included 20th Century Portraits, at the Museum of Modern Art; Renaissance in Fashion, an attempt to connect art and life, at the sedate Metropolitan; a national exhibit of Negro artists at Atlanta university, Atlanta, Ga. Harvard's Fogg Art museum put on the amusing Arts of the Theatre since 1900 and the Baltimore Museum of Art elected to introduce us to the Golden Age of the Russian Icon. Certain milestones in the development of American painting from 1930 to 1940 were marked by Worcester's Art museum. The Detroit Institute of Arts provided the opportunity to study Five Centuries of Marine Painting. In New York the Whitney Museum of Art showed the History of American Water Color Painting; the Pierre Matisse gallery showed Artists in Exile, and Peggy Guggenheim created a stir by the novel installation of her new gallery, Art of This Century.

Among the year's outstanding one-man shows, two were held at the Art Institute of Chicago: Henri Rousseau and Grant Wood, both exhibitions being highly controversial. Charles Dana Gibson staged a comeback at the Cincinnati museum. Corot was on view at Wildenstein's (for the benefit of the Salvation Army) and Cézanne at Paul Rosenberg's (for the benefit of the Fighting French and France Forever). John Flanagan's sculpture and Tchelitchew's painting were shown at the Museum of Modern Art. Bonington was given a big exhibition at the Lyman Allyn museum in New London, Conn. Rembrandt attracted crowds to the Metropolitan (all works selected from its own collection), and Paul Revere starred at the Boston Museum of Fine Arts.

Annuals were held as usual, among the best being the 3rd All-American Biennial at the Virginia Museum of Fine Arts, Richmond; the Whitney's well-chosen Annual; the Art Institute of Chicago's 53rd Annual (also hand-picked); the St. Louis City Art museum's Trends in American Painting of Today (staff-selected); the 137th Annual of the Pennsylvania Academy of the Fine Arts, half the exhibitors chosen by jury, half by invitation. In the decorative arts, the Brooklyn museum showed textiles by Dorothy Liebes, and Cooper Union, Spanish and Hispano-American fabrics. (D. O.)

Art Galleries and Art Museums. Museum officials during the year 1942 directed their activities into entirely different channels. Due to the urgent demands of war, the progressive era of intensive collecting was over because a definite proportion of the money available had to be spent for means of preserving the collections from air attacks, and in making plans for evacuating the finest objects

WAR PAINTINGS of Thomas Hart Benton on exhibit in New York city in April 1942. The picture at the left is "Exterminate"

from the seaboard to places of safety inland. Likewise buildings —many of which were old—had to be modified, as far as money would allow, to protect visitors in case of raids. Staffs had to be trained in first-aid practice and in air-raid drills. Such restrictions of usual activity did not imply a curtailment of service, for new techniques and ideas for collecting and displaying material were devised for wartime needs. Significant collections of world famous and priceless works were given to the people of the United States in 1942.

The most important gift in many a decade was that of the superb collection of Joseph E. Widener of Philadelphia given to the National gallery in Washington in memory of his father, the late Peter A. B. Widener, a selection of which was put on view in Washington on Dec. 20, 1942. Congress authorized the nation to pay the $195,000 (5%) tax of the state of Pennsylvania to secure these famous works consisting of: 100 paintings of several schools; many pieces of sculpture; fine tapestries, including those owned by Cardinal Mazarin; furniture and other works of first importance. The paintings, to mention but a few, include: The superb "Feast of the Gods" by Giovanni Bellini, the "Cowper Madonna" by Raphael, 14 paintings of the highest quality by Rembrandt, works by Titian, El Greco, Vermeer, and portraits by Van Dyck, also those of the Dutch and Flemish schools and other Italian schools. Gertrude Vanderbilt Whitney died in 1942 and left $2,500,000 to the Whitney Museum of American Art to be used without restriction. Herbert Greer French gave 800 of his finest prints from the 15th century to the present day to the Cincinnati Museum of Art. Thirty new American Rooms in Miniature by Mrs. James Ward Thorne of Chicago were presented to the Art Institute of Chicago.

Museums assumed their responsibilities for service during wartime. The Metropolitan Museum of Art, in New York, before evacuating its finest objects to places of safety, arranged several new types of displays: by gathering together in one place all of Rembrandt's works in the museum (which were usually difficult to see due to wide separation by collections) they succeeded in attracting the public in large crowds. Later a display of Renaissance in Fashion, contrasting the costumes in the paintings with present-day costume design, met with popular success. In December (in the evacuated galleries on the second floor) the largest exhibition of contemporary American art in all its phases was held with $52,000 in prize awards, called Artists for Victory. Native material in design was made available to everyone at the Metropolitan through the Index of American Design department which was to publish, exhibit and offer this rich material to the public in the study collection. These 20,000 superb plates of American design motifs were made during the six years of the WPA Federal Art Project. The Museum of Modern Art in New York contributed progressively toward aiding art in wartime by varied types of special exhibits: poster contests in the United States and in the South American republics to improve war designs; exchange exhibits with South and Central America; with a magnificent photograph display called Road to Victory—propaganda for freedom; also travelling exhibits on war themes as Camouflage and other vital subjects. The Art Institute of Chicago set aside one gallery for the duration as War Art Gallery and assisted Chicago artists during wartime by showing their work in the Room of Chicago Art.

Many benefit exhibitions were held in New York to raise money for United Nations war causes: the Great Dutch Masters Exhibit shown in New York and at the Art Institute of Chicago; an exhibit of El Greco's works for Greek Relief and several showings of the work of Cézanne for the Fighting French, and others. An exhibit of Chilean art was shown at the Toledo Museum of Art; and 218,089 persons viewed the travelling exhibitions of North American paintings which went to the South and Central American countries. Prominent museum and art school officials from South America visited U.S. museums as guests of the state department and other agencies.

The Frick Collection in New York is an example of a museum which built its own bombproof shelter on the premises (at a great cost) to house its priceless paintings in case of air raids; 64 paintings were stored there.

In England the relief from intensive bomb raids made it possible to evaluate the wisdom of the first plans made at the start of the war and to estimate the actual damage done by the enemy. It was proved that the most important initial step is to evacuate the most valuable objects at once to a place of safety. The art galleries of Glasgow, Plymouth, Southampton, Birmingham, Coventry and Hull were severely damaged, but their collections, having been evacuated, were unharmed. (L. B. Br.)

Arthritis.

According to a Swedish study, about half of the members of a group of patients with chronic arthritis had at least one near relative with arthritis. In the same group, the greatest frequency of onset was in winter and spring and the least frequent in summer and fall.

Investigations on possible cause have been devoted principally to the pleuropneumonia-like group of organisms which were found responsible for a spontaneous polyarthritis in rats in Java. Animals infected with organisms of this group frequently showed arthritis as a complication in a form which resembles suppurative arthritis rather than rheumatoid arthritis in man. Previously most investigators had emphasized its similarity to rheumatoid arthritis in man. In one series of patients, cultures were made from the genital tract, and pleuropneumonia-like organisms were found fairly frequently. The evidence suggests that they are capable of causing disease, either alone or in combination with other bacteria, and they may produce a condition similar to gonococcic infection of the joints. So far, pleuropneumonia-like organisms could not be isolated from the joints of patients with arthritis.

One study of the agglutination titer of sera of patients with rheumatoid arthritis led to the apparent conclusion that the relation of this disease to streptococci is nothing more than suggestive. In another study involving the attempted production of arthritis in animals by means of cultures of streptococci prepared in various ways and given by various routes, it was indicated that the hemolytic streptococci reached the joint membrane and presumably sensitized it. Small amounts of the same culture injected intravenously later were capable of eliciting inflammatory reaction in the joints and this was of a more chronic nature than that usually observed in control animals.

A new type of disease, involving the joints predominantly, was described. It was called palindromic rheumatism to indicate its recurring nature. It is characterized by oft-recurring multiple attacks of acute arthritis without fever, but with pain, swelling, redness and disability. The attacks appear suddenly, develop rapidly, generally last a few hours or days and then disappear completely but recur at irregularly spaced intervals. The cause was not identified and the treatment was inconclusive. The disease is a nuisance, but permanent crippling of any single joint was not recorded.

The majority of studies on treatment during 1942 were devoted to the use of gold-containing compounds. All reports continued to emphasize the hazards associated with this form of treatment, although there was considerable agreement as to the effectiveness of this form of therapy. Efforts were being made to find a form of gold salt which would not be so toxic to the patient and which would be as effective or more effective in combating the disease. Other forms of treatment which were studied included vitamin D and other vitamin and endocrine preparations, iontophoresis, using different vasodilating drugs, and fever therapy. The treatment of arthritic joints, once the disease has become established, is of great importance, and additional contributions to this subject continued to appear.

One section of a report on the psychologic approach to rheumatoid arthritis is subtitled "The Rheumatoid Personality." Here it is stated that there is a psychologic characteristic common to all persons in the group studied, involving marked emotional self-restriction and obsessional trends. The writer of that report did not, however, express any conclusions as to how far natural recovery from rheumatoid arthritis may be influenced by improvement in the life situation or in providing the patient with a new end in view.

Arthur, Joseph Charles

(1850–1942), U.S. botanist, was born Jan. 11 at Lowville, N.Y. He discovered a remedy for pear blight and the formaldehyde treatment for the control of potato scab and oats rust. He wrote numerous books on plant rust and other plant diseases. Dr. Arthur died at Lafayette, Ind., April 30. (See *Encyclopædia Britannica.*)

Artillery: *see* Munitions of War; World War II.

Art Sales.

Ancient stone, 250 tons of it, from the William Randolph Hearst collection was sold to an anonymous purchaser for $19,000 by Gimbel Brothers (who early in 1942 set a new precedent for a department store by launching into the auction field). This Cistercian monastery, the oldest building in the western hemisphere, was packed in 10,500 cases. It was bought at a bargain price, Hearst having paid $500,000 for it. Dr. Albert C. Barnes of Merion, Pa. bought Renoir's "The Mussel Gatherers" from Durand-Ruel for $175,000, the second highest priced Renoir ever sold. It was again a record auction season in New York. Parke-Bernet announced a $4,000,000 year for the 1941–42 season. At the Plaza art galleries receipts amounted to more than $1,000,000. Estates like the Harry Payne Whitney, the Arthur Curtiss James, the Christian Holmes brought the accumulation of several generations of collecting into the market. Attendance at all sales was up. More than 900 persons paid an admission of 50 cents to the Harry Payne Whitney sale, held on the premises of the Whitney 5th avenue mansion. The auctioning off of 30 of the Whitney tapestries, including the famous Royal Beauvais and Gobelin weaves, was the occasion for buying by many museums. Donors to the Art Institute of Chicago paid $20,000 for Boucher's Beauvais tapestry, "La Pipée aux Oiseaux."

The total for tapestries and panelling of the house was $295,411.

In England the demand for works of art showed no abatement and dealers found themselves opposed by determined private buyers. Because of the press of business the principal firms were compelled to cut their usual summer vacation of three months to as many weeks. At Christie's sale of the collection of the late Andrew T. Reid, the top price, £1,995, was given by Sir Edward Mountain for Raeburn's portrait of Alexander Houstoun of Clerkington. This came out of the Major Houstoun sale in 1918 for £2,520. At Sotheby's, Mrs. E. Guy Ridpath's well-known collection of knives, forks and spoons came under the hammer, the 310 lots bringing a total of £2,678—several showing a good increase on previous auction valuations. Changing prices as a record of changing taste became evident in the sale of the property of the late Sir Edmund Davis at Christie's. In 1923 Sir Edmund gave £1,575 for Millais' "The Eve of St. Agnes." In 1942, it fetched £630. The late Walter Jones's Turner water colours also showed a marked depreciation at Christie's. (D. O.)

Asbestos.

Sales of asbestos produced in the United States increased from 20,060 short tons in 1940 to 24,39 tons in 1941, and the available supply (sales, plus imports, less exports) increased from 262,190 tons to an estimated 400,700 tons. No recent figures were published from the leading world producers—Canada, Southern Rhodesia, South Africa and Swaziland, but United States imports from Canada in 1941 increased heavily over 1940; from South Africa the increase was less, while from other sources imports declined. (G. A. Ro.)

Ascension: *see* British West Africa.

Asia: *see* Afghanistan; China; India, etc.

Asphalt.

The usual detailed statistics on asphalt production in 1941 were not made public, but a heavy increase was reported in the consumption of petroleum asphalt, from 6,596,000 short tons in 1940 to 8,064,400 tons in 1941. Much of this increase seemed to have been due to the use of various types of petroleum asphalt in airport runway construction. (G. A. Ro.)

Assassinations.

The assassinations of 1942, actual or attempted, included the following:

Jan. 5	Melun, France. Body of Yves Paringaux, chief of staff of Vichy's interior ministry who directed suppression of anti-nazi activities, was found on railroad tracks.
Feb. 24	Ankara, Turkey. German Ambassador Franz von Papen and his wife narrowly escaped death when an unidentified young man set off bomb, killing himself and wounding two women.

A CAUSTIC REJOINDER, by Lewis in the *Milwaukee Journal*, to Heinrich Himmler's elegy of Reinhard Heydrich as "a character of rare beauty." Heydrich, known throughout Europe as "the hangman" died June 4, 1942, of wounds inflicted by two Czech patriots eight days before

June 2	Paris, France. Albert Clement, editor of *Le Cri du Peuple*, fascist newspaper, was shot and killed as he was leaving his office.
June 4	Prague, Bohemia. Reinhard Heydrich, reichs protector for Bohemia and Moravia, died of wounds inflicted by two assassins while he was riding in his automobile on Prague-Berlin highway, May 27.
Aug. 7	Arpajon, France. Henry Gachelin, close collaborator of French fascist leader Jacques Doriot, was shot and mortally wounded by an unidentified assailant as he was walking home from railway station.
Aug. 27	London. Yugoslav sources hinted that Hans Drosch, German consul general for Ljubljana district of Croatia, who "died suddenly" in Sion hotel in Ljubljana, was poisoned by anti-axis patriots.
Dec. 24	Algiers, Algeria. Adm. Jean Darlan, high commissioner in French North and West Africa, was assassinated at his office in Algiers by young Frenchman.

Association for the Advancement of Science, American: *see* AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Assollant, Jean (1905–1942), French aviator, was born Sept. 26 in Versailles. After serving in the Riff war, 1925, he became pilot for the Franco-Rumanian airline. In 1928, he failed in a first attempt to fly across the Atlantic but in the following year flew from Old Orchard Beach, Me., to Santander, Spain, although he fell short of his objective —Paris—because he ran out of gasoline. He made the 3,128-mi. non-stop flight in 29 hours 52 minutes. In 1933 he made a spectacular non-stop flight from Oran, Algeria, to Karachi, India, covering 4,098 mi. in 36 hours. A Vichy dispatch on May 9 reported "unofficially" that Capt. Assollant had been killed in action while fighting against the British in Madagascar. A Vichy dispatch of Sept. 9 said his body was found in wreckage of his plane adrift off Antsirana.

Astronomy. A notable occasion for astronomy in the western hemisphere took place on Feb. 17, 1942, when President Manuel Avila Camacho of Mexico formally dedicated Mexico's new astrophysical observatory at Tonanzintla. The dedication ceremonies were attended by many distinguished scientists. The new observatory is equipped with a 27–31-in. Schmidt telescope. Since the latitude of this observatory is 19° N., it is well located for study of much of the interesting southern sky which is inaccessible to more northern observatories.

Solar System.—*The Sun.*—New results from solar eclipse photographs made in Russia at the 1936 total eclipse added valuable data on the solar corona. Menzel and Petrie measured the wave-lengths of seven new lines in the coronal spectrum. These new lines were not identified. Probably they would prove to be lines produced by well-known elements under exceptional physical conditions.

The total light emitted by the corona is difficult to measure and apparently varies considerably. Measurement of this light during the total eclipse of Sept. 21, 1941, was made by Chang and Li with very simple equipment. They used an ordinary Weston exposure meter, a 9-cm. camera lens, and a sensitive galvanometer. With this equipment they compared the light of the corona to that of the full moon. After carefully calibrating their exposure meter, they found that at this eclipse the total light of the corona was 0.39 that of the full moon.

Planetary System.—During 1942 seven comets were discovered. Five of these proved to be rediscoveries of previously known objects, one of them having been first discovered in 1867. Both of the new discoveries were made photographically by Whipple.

A composite light curve of the asteroid Eros was obtained by Roach from photoelectric observations made on six nights. He found that this observed light curve may be quite well represented by a theoretical curve based on Lambert's law of reflection, provided one assumes a geometrical figure with dimensions in the ratio 1:4:13. If an idealized case of a three-axis ellipsoid is assumed, the ellipsoid would have the dimensions 35 km., 15.6 km. and 7.2 km. However, small departures of the observed light from this theoretical curve suggest that the geometrical figure of the asteroid is irregular. This was a conclusion previously expressed, but from much less accurate data.

Stars.—*Special Stars and Stellar Structure.*—Neon, the gas frequently used in the tubes of advertising signs, was found to be far more abundant in the atmospheres of the stars than was heretofore believed. Unsöld, from a thorough study of line widths in spectra of the star Tau Scorpii, found that neon is the second most abundant element in the atmosphere of this hot star. Hydrogen is the most abundant element. The very great abundance of hydrogen in the atmospheres of the stars had long been known, but to find that neon, so rare on earth, is the next most abundant element was indeed surprising. A test of the abundance of neon in the atmospheres of other stars was awaited with great interest.

It was suggested by Lundmark, Duncan and others some 20 years previously that the well known Crab nebula in Taurus was probably the same object as the "guest-star" which was observed in the far east in A.D. 1054. Duyvendak published new translations of Chinese and Japanese records which lent support to this idea. Mayall and Oort made a careful examination of the evidence, including a study of recent observations, especially those of Baade and Duncan. They concluded that the "guest-star" or nova of 1054 was really a supernova—in fact was one of the brightest supernovae on record. Considering the observed rate of expansion of the nebula, they found that the outburst which produced it should have occurred about A.D. 1100. The discrepancy in time is not serious, since the rate of expansion need not have been constant. The position in the sky of the nebula and of the nova is approximately the same, as nearly as can be determined from the early records. Mayall and Oort concluded that a preponderance of evidence indicated that the Crab nebula is the result of the outburst of the supernova which was so conspicuous a stellar object in the year 1054.

Photographs of the Crab nebula taken by Baade in different selected regions of wave-length showed that the nebulosity consists of two distinct parts. There is an outer system of filaments, shown beautifully by the $H\alpha$ region of the spectrum, and an inner mass of amorphous structure which is shown by photographs in the blue. Baade found that the line spectrum originates in the outer filaments, whereas the continuous spectrum originates in the inner amorphous mass.

A detailed study of the spectra of planetary nebulae by Wyse added to the knowledge of these interesting objects. From his detailed investigation Wyse concluded that these nebulae are not divided into two sequences, carbon and nitrogen, like the Wolf-Rayet stars. He found that there are no important differences in chemical composition between these nebulae and the diffuse nebulae, such as the great nebula in Orion. It appeared, therefore, that an interpretation of the physical conditions in one type should apply to the other as well.

External Galaxies.—The rotation of the spiral nebula Messier 33 in Triangulum was investigated by Mayall and Aller. Radial velocity observations were made of 25 bright condensations distributed over the nebula, and of the nebulosity in the region of the nucleus. The velocity of the system was found to be −167 km.sec., and the inclination of the principal plane of the spiral to the line of sight was found to be 33°. The main body of the spiral, extending to 18′ from the centre, appears to rotate almost like a solid body, the rotational velocity increasing uniformly with distance. The outer parts of the nebula, extending between 18′ and 30′ from the centre, appear to rotate like a planetary system for the rotational velocity decreases with distance. Comparison of these results with those for the neighbourhood of the sun in our own galaxy strengthened the belief that the sun is located at a considerable distance from the centre of our own stellar system.

Phenomena Visible in 1943.—*Feb. 4–5, 1943. Total Eclipse of the Sun.*—Visible in eastern Siberia and northern Japan near sunrise on Feb. 5, most of the path of totality over the northern Pacific ocean. The total phase visible near sunset on Feb. 4 in Alaska. Partial phases of this eclipse visible from the northern Philippines, Hawaii and the entire Pacific coast of the United States.

Feb. 20, 1943. Partial Eclipse of the Moon.—Visible generally in Europe, most of Africa, the Atlantic ocean, North America, South America and the eastern Pacific ocean.

Aug. 1, 1943. Annular Eclipse of the Sun.—Visible as an annular eclipse only in the southern Indian ocean and the seas south of Australia. Partial phases visible in Madagascar, the East Indies, Australia and New Zealand.

Aug. 15, 1943. Partial Eclipse of the Moon.—Visible in the western Pacific ocean, Antarctica, Australia and New Zealand, the Indian ocean, Asia, southeastern Europe, and Africa, with the exception of the northwestern part.

Athlone, 1st Earl of (ALEXANDER AUGUSTUS FREDERICK WILLIAM ALFRED GEORGE CAMBRIDGE) (1874–), British statesman, was born April 14 at Kensington palace, the third son of the 1st duke of Teck. Educated at Eton and the royal military college, Sandhurst, he served in Matabeleland, Southern Rhodesia, in 1896 and saw action during the Boer war. During World War I he was mentioned twice in dispatches, and in 1917 he was created 1st earl of Athlone. He was governor general of the Union of South Africa from 1923 to 1931. In 1936 he was appointed personal aide-de-camp to the king. He was appointed 16th governor general of Canada April 3, 1940, to succeed the late Lord Tweedsmuir. In a speech on Dec. 10, 1942, he defended Britain's imperial system, asserted the independence of the self-governing dominions was "a fact and not a fiction" and urged critics to be more tolerant in their criticism of the empire.

Atholl, John George Stewart-Murray, 8TH DUKE OF (1871–1942), Scottish peer, was born Dec. 15. He headed the Murray clan of the Highland Scots and inherited the right to maintain a private army by a decree handed down to his father by Queen Victoria. He was a staff officer with the Egyptian cavalry during the Nile expedition, 1898, and served under Lord Kitchener at Khartoum; he also saw action during the Boer war. The duke was a brigadier general during World War I and was a member of the home guard during World War II. He was lord high commissioner to the Church of Scotland, 1918–20 and lord chamberlain, 1922. He died in Perthshire, Scotland, March 16.

Attlee, Clement Richard (1883–), British politician, was born Jan. 3 and was educated at Haileybury and Oxford. He was called to the bar in 1905 and from 1913 to 1923 lectured in social science at the London School of Economics. In World War I he served in Gallipoli, Mesopotamia and France. He was undersecretary of state for war in the first Labour administration (1924) and postmaster general in the second (1931). He became leader of the parliamentary Labour party in 1935. He joined Churchill's war cabinet in May 1940 and in the autumn of 1941 attended the International Labour conference in New York City. In Feb. 1942 he was appointed dominions secretary and deputy prime minister; in September he visited Newfoundland and Canada. He stated that economic questions and improvements in standards of living and nutrition in the post-war world should not be neglected through preoccupation with political problems.

Attu: *see* ALASKA; WORLD WAR II.

Auchinleck, Sir Claude John Eyre (1884–) British army officer, was born in England, the son of Col. John Claude Auchinleck. He served in India in 1902, and was stationed in Egypt and Mesopotamia during World War I. In 1933 and 1935 he fought against native tribesmen on the northwest Indian frontier. In the spring of 1940 he was made commander of the Allied forces in northern Norway. He took Narvik but was forced to evacuate the city when the Allies failed to make additional landings in the south. In the summer of 1940, after the collapse of France, Auchinleck was appointed general officer commanding the English southern command, and he organized the first defenses of England to forestall the threatened German invasion. In Dec. 1940 he returned to India as commander in chief. In July 1941 he was made commander in chief of British middle east armies, succeeding Gen. Sir Archibald Percy Wavell. Auchinleck's armies in Libya, under Gen. Sir Alan Cunningham, launched an offensive against axis forces Nov. 18, 1941, and advanced far into Libya.

After Rommel counterattacked and drove the British out of Libya in June 1942, Auchinleck took over command of the British 8th army from Gen. Neil Methuen Ritchie; on Aug. 18 it was announced that Auchinleck had been replaced by Gen. Harold R. L. G. Alexander as commander of British middle east armies.

Australia, Commonwealth of. A self-governing member of the British Commonwealth of Nations, situated in the southern hemisphere between longitudes 113°9′ E. and 153°39′ E. and latitudes 10°41′ S. and 43°39′ S.; national flag, a blue ensign, with the Union flag in the quarter and six white stars in the field. Language, English; religion, Christian (census 1933: Anglican, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist, 684,022; other Christians, 603,914). Ruler, King George VI; Governor General, the Rt. Hon. Lord Gowrie, V. C.; Premier, Rt. Hon. John Curtin.

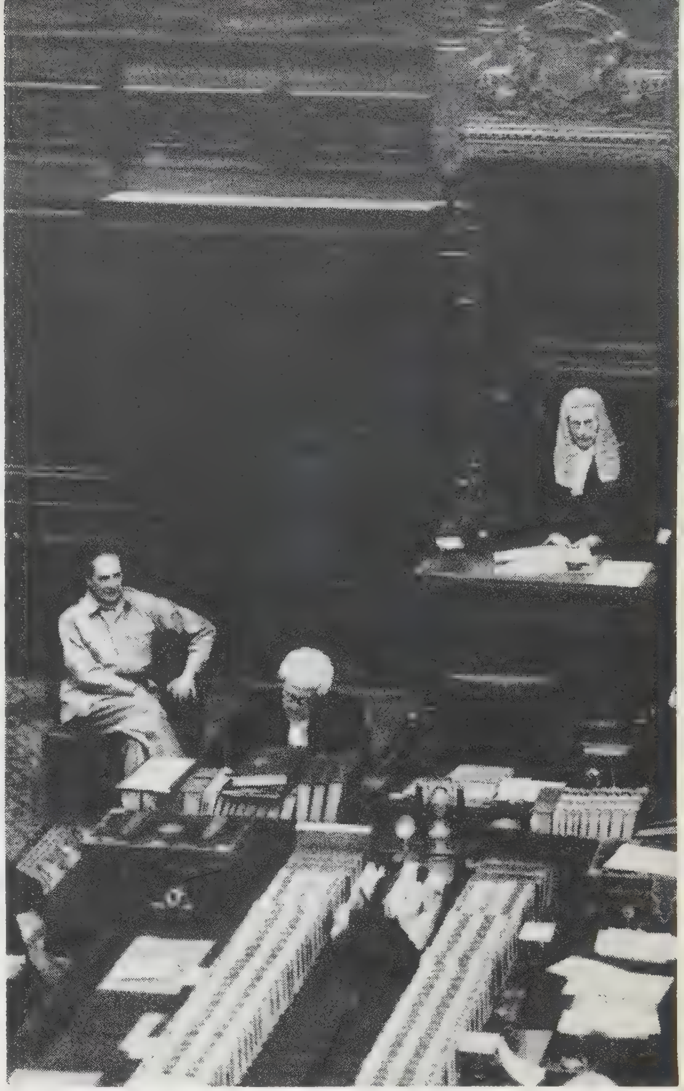
Area and Population.—Area, 2,974,581 sq.mi.; pop. (est. Dec. 31, 1941) 7,137,221. Capital, Canberra. Chief cities (pop. Dec. 31, 1940): Canberra (11,000), Sydney (1,310,530), Melbourne (1,076,000), Adelaide (330,000), Brisbane (335,520), Perth (228,000), Hobart (66,620), Newcastle (116,000).

History.—The Labour government under its prime minister, John Curtin, remained in office throughout 1942. The vigour as well as the ability with which the government had organized the nation for war and dealt with unprecedented problems had gained for it support from the opposition parties in the house of representatives and the undoubted backing of the public. The government's policy was clearly defined by Curtin when in June he explained in the house that one of the Labour party's objectives, the nationalization of banking, would not be introduced during the war. In June, leaders of the government met representatives of the trades unions in an historic conference. As a result, the unions became an integral part of the government machinery for raising production, accepting responsibility for uninterrupted war production flow, and also accepting in principle the compulsory call-up of labour for the vast defense program controlled by the allied works council.

The most controversial legislation passed during 1942 was the National Security (mobilization of services and property) regulations gazetted in February, and the Uniform Tax bills passed in June. The former empowered the minister or any person authorized by a minister to direct any person resident in Australia to (*inter alia*): (1) perform such services as were specified in the direction; (2) to place his property at the service of the commonwealth. It was not unexpected that some opposition would be shown by the house to regulations which represented so great an abrogation of personal liberties. After receiving assurances from the prime minister that such powers were necessary for the urgent prosecution of the war, and would only be used in the national interest, a motion to disallow the regulations was defeated by 54 votes to 7. In April, at a conference of commonwealth and state ministers, the prime minister submitted proposals that, for the duration of the war and one year after, the states should vacate the field of income tax. Curtin explained the government's view that a uniform tax was the only method by which the heavy burden of taxation could be equitably distributed with reasonable conformity to the principle of ability to pay. The commonwealth government was charged with the financing of the entire war effort while the states found their revenue increasing and their obligations decreasing. He suggested compensation based on the revenues received by the states over the past two years from this source and promised that his government would finance new social legislation including widows' pensions. On the grounds that the proposals struck at the sovereignty of the states and that they might never recover their power to levy income tax, the state premiers rejected the proposals. The federal government then introduced four bills providing for the imposition of a uniform tax and the transfer to the commonwealth of the trained staff and accommodation and equipment used by the states for collecting income tax. These bills passed through both houses in June. The validity of this legislation was contested by the states of Victoria, Queensland, South Australia and Western Australia. By a majority of 3 to 2 the high court upheld the validity of the acts.

In Australia, as elsewhere, questions of postwar reconstruction were exercising the minds of economists and legislators. The view of the government was that, unless the special war powers of the federal parliament derived from the national security regulations could be supplemented during the postwar period, the whole social and economic life of the nation would be in jeopardy. The attorney-general, Herbert V. Evatt, therefore introduced a bill in October to authorize a referendum on constitutional reform. The main clause sought full powers for the commonwealth to make laws for "carrying into effect the war aims and objects of Australia as one of the United Nations, including the attainment of economic security and social justice in the postwar world and postwar reconstruction generally." Specific powers sought were for such matters as repatriation, employment, production, price control, improvement of living standards, transport, health and child welfare. The bill also sought to authorize the commonwealth to implement the Atlantic Charter's four freedoms. At the end of November a constitution convention, comprising representatives of the federal government and opposition parties, state premiers and state opposition leaders, met at Canberra to consider the government's proposals. Eventually it was agreed unanimously that specific powers should be transferred voluntarily by the states for five years after the cessation of hostilities under section 51 of the constitution, instead of permanently by referendum.

In October parliament ratified the Statute of Westminster.

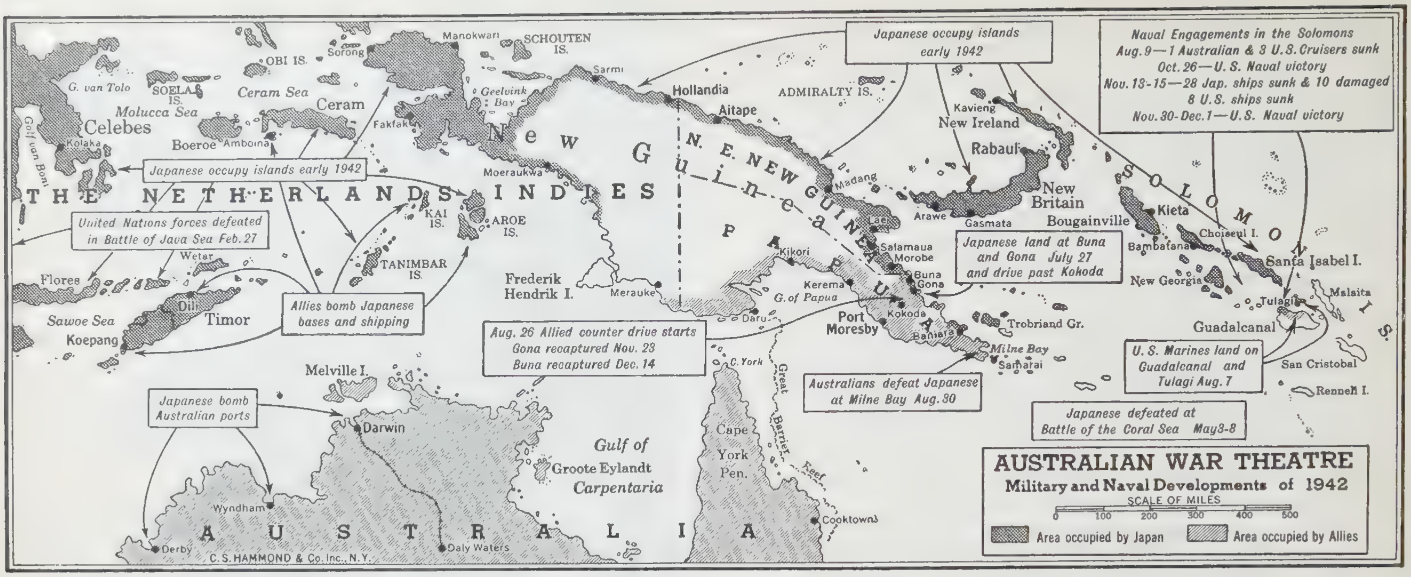


TO GEN. DOUGLAS MAC ARTHUR the Australian house of representatives extended a rare invitation March 26, 1942—to sit at the right of the house speaker

External Affairs.—On his return to Australia in August after an 11 months' trip as special representative of the government to the British war cabinet and the Pacific war council, Sir Earle Page was co-opted to the Australian advisory war council and to attend meetings of the war cabinet. During the middle of the year Dr. Evatt, the attorney-general, visited Washington and London to consult President Roosevelt and Winston Churchill. In America he took part in the formation of the Pacific war council and in the United Kingdom attended meetings of the war cabinet. On Dr. Evatt's return to Australia via Washington in June, the government appointed Stanley Bruce (the high commissioner in London) as accredited representative on the United Kingdom war cabinet and Pacific war council in London. In April Sir Owen Dixon was appointed Australian minister to Washington in succession to Casey, who had resigned on his appointment as British minister of state in the middle east; in October, William Slater became first minister to the U.S.S.R.

The government's attitude to the League of Nations was defined by the prime minister when he announced the cabinet's approval of a payment of £34,000 to the league as Australia's contribution for 1942. He said "It is of the greatest importance to keep up the framework of the league so that 20 years' accumulated experience in international co-operation and administration is not lost."

Public Finance and Economic Affairs.—During 1942 the whole economic life of the nation was dominated by the necessities of war. In prewar years approximately 500,000 factory workers were engaged in the production of peacetime needs. By the end of the year, this number had been reduced to 200,000 (despite the virtual cessation of all imports other than for war needs) while about



500,000 factory workers were engaged on war needs. The government's man-power proposals would result in 1,600,000 men (or 60% of the total male working population) being in the fighting forces or on war work by the end of 1942. Similarly, agricultural production was being planned and controlled. For the year 1942–43 the governmental man-power authorities and production executive carefully balanced the needs of the rural industries with war requirements and established definite production goals. These included 170,000,000 gal. of milk; 35,000 tons of condensed milk; 15,000 tons of dried milk; 560,000 tons of beef; 380,000 tons of mutton and 92,000 tons of dried vine fruits. The government introduced a bill for the establishment of a mortgage bank which would provide loans of from 3 to 35 years to primary producers at about 4%.

Total war expenditure for the fiscal year ended June 30, 1942 was £A.319,000,000, of which £A.108,000,000 was provided from revenue and £A.211,000,000 from loan funds. In addition to that sum, the commonwealth recovered £A.34,000,000 from other allied administrations for munitions supplies and services, so that the gross expenditure on the war effort totalled £A.353,000,000. Non-war expenditure, which amounted to £A.101,500,000, was £A.2,000,000 less than anticipated. Total revenue receipts were £A.210,000,000 against the estimate of £A.196,000,000, which included additional taxation to the extent of £A.12,000,000 imposed in Dec. 1941. Consequent upon these factors £A.108,000,000 war expenditure was met from revenue compared with £A.80,000,000 contemplated in the Nov. 1941 budget. J. B. Chifley, the Labour treasurer, introduced his budget for the fiscal year 1942–43 on Sept. 2. Expenditure on all services other than war was estimated at £A.109,492,000, an increase of £A.8,086,000. The principal increases were: Invalid and old-age pensions £A.3,143,000; widows' pensions £A.1,630,000; child endowment £A.757,000. War expenditure was estimated at £A.440,000,000, of which £A.390,000,000 was to be spent in Australia. Total estimated revenue from all sources was estimated at £A.249,000,000, excluding the sum of £A.27,000,000 imposed under the uniform taxation plan for payments to the state governments. This left the sum of £A.300,000,000 to be financed by loan, of which it was hoped to raise £A.240,000,000 from public loans and £A.60,000,000 from the sale of bonds and saving certificates. The Labour administration, Chifley said, had imposed new taxation on three separate occasions during the preceding fiscal year which, together with his new budget proposals, would bring in approximately £A.75,000,000 per annum additional revenue.

At June 30, 1942 the aggregate public debt of the commonwealth and states was £A.1,629,000,000, made up of commonwealth £A.718,000,000 and states £A.911,000,000. Two Liberty loans each of £A.35,000,000 were floated during the year, each being oversubscribed, and later in the year an "Austerity" loan of £A.100,000,000. New measures included further restrictions of sports meetings; a reduction by one-third of the production of beer and reductions in the release of wines and spirits for consumption; heavy entertainments taxes and censorship of advertising.

Banking and Finance.—Revenue (actual 1941–42), £A.209,500,000; (est. 1942–43), £A.249,000,000; expenditure (actual 1941–42), £A.209,500,000; (est. 1942–43), ordinary £A.109,492,000; defense, £A.440,000,000; public debt (June 30, 1942), £A.1,629,000,000; notes issued April 18, 1942, £A.95,900,000; gold and sterling reserve (June 30, 1941), £A.17,705,000; exchange rate, £A.125 = £100 sterling.

Trade and Communication.—Oversea trade 1940–41 (merchandise): imports, £A.136,300,000; exports, £A.136,400,000; (bullion and specie 1938–39): imports, £A.3,562,000; exports, £A.18,963,000. Communications and transport: 1939, roads, total mileage, *c.* 500,000; metalled, *c.* 200,000 mi.; railways open to traffic, 27,234 mi.; airways (1940–41), distance flown, 9,699,700 mi.; passengers carried, 150,259; goods carried, 2,114,785 lb.; mails carried, 509,200 lb.; shipping with cargo and in ballast, in net tons, entered (monthly average 1939–40), 508,000; cleared (monthly average 1939–40), 502,000; motor vehicle registrations (March 31, 1942): cars, 463,616; commercial vehicles, 259,999; cycles, 54,157; wireless receiving set licences, 1,324,124; telephones, number of lines, 534,485.

Agriculture, Manufactures, Mineral Production.—Production (in metric tons): wheat (1941–42), 4,570,000; gold (1939), 51,187 kg.; wool (1941), 508,000; cane sugar (1939–40), 943,000; coal (1940), 12,464,000; lignite (1940), 4,000,000; iron ore (metal content) (1938), 2,287,000; pig iron and ferroalloys (1938), 945,000; wine (1939–40), 675,000 hectolitres; oats (1939–40), 185,000; barley (1939–40), 305,000; maize (1939–40), 208,000; potatoes (1939–40), 328,000; butter (1940–41), 196,400; lead (smelter production) (1939), 185,000; zinc (smelter production) (1938), 70,000; copper (smelter production) (1938), 17,400; tungsten ore (1938), 540; antimony ore (1938), 900; silver (1939), 385. Labour and employment: employment in factories (1928–29 = 100), Feb. 1942, 161.4; number (average Feb. 1942) 697,000; unemployment, trade union returns (March, 1942), 1.8%; recorded material production (1939–40), £A.527,085,000.

Automobile Industry in the War.

The year 1942 opened with an order from the Office of Price Administration "freezing" all retail deliveries of new passenger cars and new motor trucks. Sales to consumers remained dormant throughout January and February, with the exception of purchases which had been completed prior to Jan. 1 except for physical delivery of the vehicle.

On Jan. 21, all production of passenger cars and light commercial vehicles was ordered stopped after completion of the January quota previously allotted. Companies which on Jan. 31 still had in stock a considerable quantity of finished and semi-finished parts for assembly and could assemble a number of new vehicles without using up considerable quantities of additional raw materials were permitted to produce such units until midnight, Feb. 10.

All facilities of men and machines were then placed 100% at the disposal of the war program. Conversion of factories and equipment and training of men were vigorously carried out on a 24-hours-a-day schedule.

Other orders from the director of industry operations of the War Production board curtailing and finally discontinuing completely all civilian production of medium and heavy trucks and motor buses were put into effect. Medium motor trucks with a manufacturer's rated carrying capacity of $1\frac{1}{2}$ tons to 3 tons were discontinued April 30, while heavy civilian motor trucks with a rated capacity of 3 tons and up were discontinued May 31.

The demand for production facilities for military vehicles and the need to conserve raw materials became so great that the government found it necessary even to abandon production of such essential civilian articles as motor trucks.

For the first time in the history of the motor vehicle manufacturing industry, the production of passenger cars, motor trucks and motor buses for civilian use was completely stopped, for the industry as a whole. In previous years, of course, individual factories had been closed down for a few weeks or months while changing models, but never before had the entire industry been blacked out as far as production of new civilian vehicles was concerned.

On March 2, the rationing program for new passenger cars was inaugurated. A system of eligibility classifications had been established for the purpose of channelling the distribution of new passenger cars into the hands of those considered as having the greatest need for them. These were:

1. Doctors, veterinarians and visiting nurses.
2. Persons needing ambulances.
3. Ministers.
4. Persons engaging in fire-fighting.
5. Persons needing cars for police work.
6. Persons needing cars on public health and safety work.
7. Persons needing cars for U.S. mail service.
8. Taxicab and like service.
9. Persons needing cars for highway construction and repair.
10. Executives and workers in war plants and affiliated factories, mines, etc.
11. Federal, state and local workers on public health, safety or war work.
12. Persons lacking trucks who need cars to move farm produce.
13. Traveling salesmen selling productive machinery to farms, factories, mines, etc., or engaged in food and medical lines.
14. Persons needing cars to haul newspapers for wholesale delivery.
15. American Red Cross.

In order to obtain a vehicle, each person was required to apply to his local Price and Rationing board, set up by the Office of Price Administration, proving that he was eligible for a new car.

On March 9, a program for the distribution of the available supply of new commercial vehicles was instituted, with the following eligible classes:

1. Vehicles used by military forces in the field; police, fire-fighting, public health, mail and communication services.
2. Vehicles used on fixed military and naval posts; transportation of materials directly connected with the war effort, including farm and forest products; construction and maintenance of essential transportation facilities, defense housing projects and public utilities; and transportation of persons directly connected with the war effort.
3. Vehicles used to transport ice, and fuel for heating and power to the ultimate consumer; farm and forest products indirectly connected with the war program, essential repair services, waste and scrap materials; persons in business and industry indirectly connected with the war program and in the service of public and private schools.
4. Vehicles used to transport persons or goods not connected with the war program, including all forms of retail delivery except fuel and ice.
5. Vehicles used for non-essential functions.

Before applying for a new vehicle, applicant must exhaust possibilities of renting, pooling, repairing, salvaging, revising schedules, buying used vehicles.

The administration of the rationing order was handled jointly by the Office of Defense Transportation and the War Production board. The ODT, charged with the responsibility of maintaining the transportation system, promulgated the regulations and classifications governing eligibility and made recommendations on specific applications for purchases of new commercial vehicles to the automotive branch of the War Production Board, which carried the final responsibility of rationing the new commercial vehicles to the user.

An inventory of new passenger cars in the hands of dealers, distributors and manufacturers on Feb. 28, 1942, showed a total of 381,325 vehicles, which had been produced and shipped to retail outlets prior to Jan. 16, 1942. In addition, there were 139,468 new passenger cars produced between Jan. 16 and Feb. 10, 1942, inclusive, which were earmarked as a governmental pool of cars to be distributed after March 1, 1943, giving a total of 520,793 new cars to last for the duration of the war. It was estimated that 245,454 new cars were released to consumers between March 2 and Dec. 1, 1942. This left a total of 135,871 vehicles to be rationed between December 1, 1942 and March 1, 1943, with a total of 139,468 reserved for essential users after March 1, 1943.

At the beginning of the rationing program for commercial vehicles, it was estimated by the Office of Defense Transportation that there were approximately 190,000 new commercial cars and trucks in the hands of dealers, distributors and manufacturers. Between March 9, 1942 and Dec. 19, 1942, there were released to the public and the government a total of 21,677 light trucks under $1\frac{1}{2}$ tons capacity, 50,872 medium trucks from $1\frac{1}{2}$ tons up to 3 tons capacity, and 11,592 heavy trucks with a rated capacity of 3 tons and up, or a total of 84,141 new trucks. This would leave 105,859 new trucks on hand for rationing during the remainder of the war, not including 4,000 heavy trucks allotted to a selected group of truck manufacturers for production during the latter part of 1942 and the first part of 1943.

Between Jan. 1 and Feb. 10, 1942, when all-out conversion began, 215,545 new passenger cars were produced. It had been expected that when factories closed down completely for conversion to 100% war work, there would result an immediate lay-off of several hundred thousand workers, and that a heavy load would be placed on relief agencies. Fortunately the anticipations were not realized, since the low point in employment reached in February dropped only $12\frac{1}{2}\%$ below December, followed by a much more rapid increase than had been looked for, so that by Dec. 1942 an estimated total of 960,000 wage earners were engaged in war production in the automotive industry (including motor vehicle, parts, and tool and die companies), an increase of 55% above the low point of 620,000 in February, and a gain of 26% above the 1941 peak employment.

DRAFTING DEPARTMENT of Willow Run, huge bomber plant built by Henry Ford and completed in 1942

On Dec. 7, 1941, when Pearl Harbor was attacked, the industry held approximately $4,850,000,000 in war orders. In the succeeding few weeks, war orders doubled and then tripled. By Nov. 1, 1942, the industry backlog stood at approximately $14,000,000,000. This was distributed among various categories of armaments as follows:

Complete aircraft, aircraft engines, propellers, and miscellaneous aircraft products	43.4%
Military vehicles and parts	26.3%
Tanks and parts	13.3%
Artillery, machine guns and parts	5.7%
Ammunition	3.6%
Marine equipment	6.0%
All other war products	1.7%
	100.0%

Principal war assignments consisted of:

Complete aircraft
Airframes
Fuselage and wing parts
Propellers
Control equipment
Landing gears
Gliders
Medium and light tanks
Amphibian tanks
Marine tractors
Aircraft cannon
Anti-aircraft cannon
Machine guns
Carbines
Shells, cartridges and other ammunition
Torpedoes
Large variety of military vehicles and armoured cars
Tank destroyers
Engines for surface and submarine vessels
Machine tools
Jigs and fixtures
Electrical control equipment for aircraft, artillery and other purposes
Tractors
Trailers
Radios
Bayonet scabbards
Batteries
Field kitchens
Armour plate
Forgings
Castings
Magnesium
Sirens
Searchlight reflectors
Gyroscopes

Besides these and other major units, there were several hundred parts and components of these armaments that were produced by subcontractors in the industry.

The engineers met the challenge of turning out new products by devising shortcuts in manufacturing technique; developing substitutes for scarce materials and thereby releasing thousands of tons of strategic metals to other more important uses in the war program; and, without sacrificing quality, reduced the quantity of scarce materials originally specified per unit in a large number of other items. Through a combination of these factors they cut the costs per unit by large percentages, resulting in aggregate savings to the government running into billions of dollars.

Soon after Pearl Harbor, the automotive industry organized the Automotive Council for War Production, in order to expedite the manufacture of armaments by the industry. Its purpose was to foster the complete interchange of mass-production information, time-saving techniques, product improvements, tooling shortcuts and developments in all war products assigned to the industry.

To assist manufacturers in the most rapid conversion of peacetime facilities to the production of armaments, the council established a service which listed machine tools and equipment, idle after the stoppage of car production, for sale to anyone needing them in war work. Some of the machines even found their niche in factories located in China, Great Britain and Russia.

Another activity, the Tooling Information service, consisted of listing facilities available for tooling up factories and listing firms seeking work for their own equipment in the tooling program.

Information on factory facilities available for subcontracts, as well as work to be parcelled out, was developed as a means of bringing together small factories with facilities but no contracts, and companies with large contracts needing additional facilities to speed up the production of the finished article.

A traffic division was established to facilitate the shipment of armaments from the factories to their destination, and the expeditious handling of incoming raw materials and parts.

For the purpose of pooling and exchanging ideas among the production experts of the industry, a products division was set up. Committees were arranged for each product classification, such as tanks, engines, ammunition, artillery, motor vehicles, for the purpose of dealing with specific problems. Meetings generally took place at the factories which had developed some new method of solving a difficult problem so others could see the work, take notes and make sketches.

Because of the large volume of military vehicles produced, a separate Military Vehicles division was established, to exchange ideas on production, engineering, packaging and shipping.

A number of other activities facilitating armaments production were also undertaken by the council.

The close of the year 1942 found the industry had turned out an actual production of $4,665,000,000 worth of war goods during the calendar year 1942, and was operating at a rate of $7,000,000,000 a year. The $4,665,000,000 figure was 14% above the civilian production of the best previous year.

It was expected that the calendar year 1943 would have an output approximately double that of 1942.

Indicating the significant role which the automotive industry played in the total war effort of the nation, Donald M. Nelson, head of the War Production board, in mid-year 1942 stated that when the automotive industry and the nation as a whole reached their manufacturing peak, the automotive industry would be producing at the rate of $12,000,000,000 a year, and turn out approximately one-sixth of the entire war program.

Significant statistics on other phases of the automotive industry during the calendar year 1942 are shown in the following tabulation. (*See* also BUSINESS REVIEW.)

1942 Automobile Facts and Figures

Preliminary statistics of the automobile industry compiled by Automobile Manufacturers Association

MOTOR VEHICLE REGISTRATIONS

	1941	1942
Motor Vehicles Registered in U.S.		
Passenger cars	29,507,113	27,400,000
Commercial vehicles	4,876,054	4,600,000
Total	34,383,167	32,000,000

(These figures represent cumulative total of vehicles registered during the year including those retired from service after registration.)

RURAL TRAFFIC VOLUME

1942 Traffic Volume on Rural Roads based on traffic counts on several hundred selected main highways—per cent change from same month in 1941.

January	+ 1.0%	July	−31.3%
February	− 7.6%	August	−35.0%
March	−11.3%	September	−29.0%
April	−15.8%	October	−29.7%
May	−21.6%	November	*
June	−26.5%	December (est.)	−35% to −40%

*—Not Available

MOTOR VEHICLE USER TAXES

	1941	1942
Total Motor Vehicle User Taxes	$2,150,305,000	$2,004,645.000
Federal		
Excise taxes	562,962,000	425,121,000
Use taxes	——	209,200,000
State		
Registration receipts	511,242,000	465,230,000
State gasoline taxes	947.101,000	786,094,000
Municipal, County, Personal Property and Tolls	129,000,000	119,000,000

MOTOR TRUCKS AND BUSES

Motor trucks in use	4,600,000
Motor buses in use	150,000
Number of communities served only by motor vehicles	54,000
Number of children carried to school daily by buses	4,200,000
Per cent of trucks privately owned and operated	88%
Per cent of trucks on farms	26%
Per cent of livestock tonnage hauled to market by truck	67%

PASSENGER CAR USE

Number of U.S. cities without local mass transportation, dependent on passenger cars	2,320
Per cent of passenger cars on farms	15%
Per cent of passenger cars in rural non-farm areas	14%

(O. P. P.)

Automobile Racing.

With rubber and gasoline both rationed and with manpower being utilized on the war production line, automobile racing marked time for the duration. For the first time in its history, the annual Memorial Day 500-mile Indianapolis classic was scratched from the American sports calendar. Similarly, auto racing at Langhorne, Pa., Union, N.J., Milwaukee, Wis., Syracuse, N.Y., and other race centres, both in the U.S. and abroad, was idle during the year and would remain so until the war was over.

Thus the honours attained in 1941 still stood on the records: Mauri Rose of Indianapolis and Floyd Davis of Springfield, Ill., remained as the last champions of the Indianapolis race, having won the 1941 classic with the speed of 115.117 miles per hour to win $29,985.

Davis, famed dirt track contestant, started the race in the winning machine owned by Lou Moore, retired Indianapolis driver. Rose, one of the most consistent finishers in speedway competition, relieved Davis at 177½ miles after Rose's own car, of which Moore was the manager, was forced out at the 152-mile mark by carburettor trouble.

Other records set during the 1941 season, which would continue to be recognized until automobile racing was resumed were the following:

Harley Taylor of Atlanta, Georgia, set a record for 50 miles in a stock car on a dirt track by doing 100 laps on the half-mile Southern States fair grounds track at Charlotte, N.C., in 59.43.3. Ray Hall of the same city, won the 200-mile stock car auto race at the Langhorne, Pa., speedway, averaging 69 miles per hour.

Among the leaders of feature events in the midget class was Mike Joseph who set a new record for 20 laps at the New York coliseum in 3.37.42. Another winner was Lloyd Christofer of Miami, Fla., who won the Union, N.J., 25-lap midget feature in 5.47.85.

Mays, with his second at Indianapolis and firsts at Milwaukee, Wis., and Syracuse, N.Y., retained the American Automobile association national point championship. He was credited with 1,225 tallies. (T. J. D.)

Aviation, Civil.

Military requirements completely dominated civil aviation activities throughout the world during 1942. What private flying remained was chiefly in the United States. This virtually ceased during the early months of 1942 as the majority of the nations in the western hemisphere joined the rest of the world at war. Civilian flying schools in the U.S. continued and expanded under private operation, but nearly all operations were conducted under contract with the government or geared directly to war needs. U.S. foreign and domestic commercial airlines remained under private ownership and expanded to establish new records in all categories.

International Transport.—Pan American Airways system expanded its routes to every continent of the earth and dominated the field of international air transport. Although continuing under private ownership and direction, certain equipment and facilities of the organization were devoted to serving the war effort of the United Nations and all operations co-ordinated with the U.S. army. Virtually all passenger, mail and cargo traffic out of the U.S. moved under government priorities, but on some routes, whenever space was available, the general public was served as usual.

Pan American's Pacific division lost some equipment and bases during the initial Jap onslaughts, but within a few days re-established service on a wartime basis. During the year the division flew approximately 1,000,000 ton-mi. of cargo, 1,225,000 ton-mi. of mail and carried 5,000 passengers 14,500,000 passenger miles.

The operation of this division was on a strict war-time basis. However, new heights of operational efficiency were achieved. Before the war the division operated its clippers an average of 5.08

hours per day. The average for 1942 was more than 10 hours per day.

China National Airlines, Pan American affiliate in the Orient, played an important role in the evacuation of refugees from combat zones. Operating usually at night and frequently in weather so severe that Jap fighters could not attack, more than 5,000 persons were carried to safety; sometimes as many as 60 and 70 passengers were carried in 21-place Douglas DC-3 transports.

Pan American Airways-Africa, Ltd., which operated across the South Atlantic to various bases in Africa and thence to India and China, flew over 6,000,000 mi. up to Oct. 21, 1942, when this service was taken over by the military.

Pan American's transatlantic operations broke all records, with 3,000,000 mi. flown as compared with 1,519,307 in 1941. A total of 23,000 passengers were carried 55,638,000 passenger miles, increases of 140% and 150%, respectively, over 1941. Air express made phenomenal gains from 16,500 lb. in 1941 to 3,135,000 lb. in 1942. Volume of mail nearly doubled; 1,224,000 lb. carried in 1942 as compared with 673,000 the preceding year.

High point of stepped up transatlantic operations was a 48-hour period when 12 clippers shuttled in and out of New York's LaGuardia field marine base to average an arrival and departure every four hours. By the end of 1942, clippers had made a total of 1,219 crossings since service started May 20, 1939.

In the Caribbean and Central and South American areas Pan American's activities also increased. A new service was inaugurated in October across the Caribbean between Miami and La Guaira, port of entry for Caracas, capital of Venezuela.

The year 1942 saw a tremendous expansion in the Miami express department. At the end of the year more air freight was being transported in and out of Miami in a single month than during the entire year preceding. The eastern division, operating from Miami to the south, flew approximately 9,000,000 mi. as compared with 5,816,163 in 1941.

Under the program initiated by the U.S. and Latin American governments, Pan American effectively replaced some 30,000 mi. of axis-controlled air services in South America formerly operated under the auspices of Germany, Italy and Vichy France.

Panair do Brasil, Pan American affiliate operating in Brazil, increased route mileage from 5,800 in 1941 to over 13,000 in 1942.

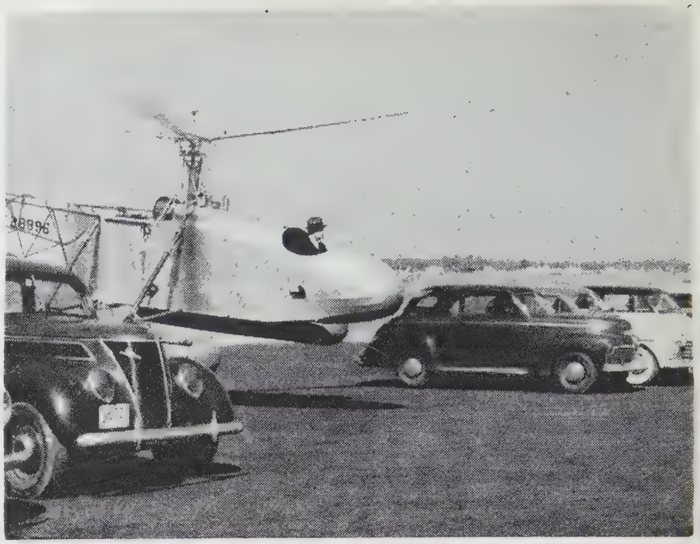
The school operated by Pan American at the University of Miami for the training of U.S. army and British royal air force cadets in celestial navigation was expanded and speeded up to a 7-day basis.

What is believed the first actual all-cargo airline in the western hemisphere was inaugurated in midyear by Pan American Grace Airways, a Pan American affiliate. It ran from Balboa in the Canal Zone to Lima, Peru.

The entire Pan American Airways system, including foreign affiliates, showed substantial gains in all categories, particularly in express carried and passenger miles flown. Totals for 1942 are estimates based on latest available figures. Miles flown in 1942, 27,554,227, as compared with 24,358,346 in 1941; passengers carried in 1942, 470,716, as compared with 375,732 in 1941; passenger miles flown in 1942, 343,087,980 compared with 227,638,738 in 1941; and express carried in 1942 was 24,752,806 lb. as against 15,638,738 lb. in 1941. Total route mileage was just under 100,000, unchanged materially from the previous year.

In the summer of 1942 American Export Airlines inaugurated transatlantic passenger and express service between New York and Foynes, Ireland, with a small fleet of Vought-Sikorsky flying boats.

In Canada, Trans-Canada Air Lines broke all previous traffic records, flying 22,790 mi. a day over 4,857 mi. of routes. In 1942, the line carried 2,260,000 lb. of mail, 63% more than in 1941; 396,000 lb. of air express, an increase of 128% and 106,000 passengers, an increase of 24%. An important extension to Newfoundland was added and Trans-Canada crews participated in flights across the Atlantic and overhauled and maintained transoceanic transports as part of the war effort. Women comprised 30% of the line's personnel.



IGOR SIKORSKY "parking" his baby helicopter between two cars in Stratford, Conn. This amphibian machine, demonstrated in 1942, descends as slowly as one foot a minute, can stop in mid-air, back up, go sideways, or travel forward at 80 miles per hour

British Overseas Airways maintained its empire routes from England to the middle east, India, Australia and other points in the old world. No figures regarding these operations have been released by the British, but expansion could not have been great for it was not until the fall of 1942 that a public announcement was made to the effect that B.O.A.C. was to receive sorely needed new equipment.

The Netherlands airlines, K.L.M. and K.N.I.L.M., were knocked out early in 1942 when the East Indian colonies fell to the Jap invaders. Much of the equipment and personnel was saved, however, and removed to Australia.

The German Lufthansa, Finnish O.Y., Hungarian Malert and Rumanian Lares operations were all incorporated in the nazi military machine. Three French airlines, Air France, Aeromaritime and Air France Trans-atlantique, maintained limited operations early in 1942, but were finally forced to cease operations because of shortages of fuel, pilots and equipment, except for a few infrequent schedules to serve nazi and Vichy bigwigs.

Swissair was still operating a single line from Zurich, Switzerland to Berlin, via Stuttgart. The Swedish ABA line maintained a nonstop night airmail service from Stockholm to Great Britain. Danish airlines' operations were limited, but more passengers were carried than in the year preceding.

Domestic Air Transport in the U.S.—Activities of U.S. domestic airlines in 1942 fell into two main categories; regular commercial scheduled air transportation and numerous special flying and ground services conducted for the U.S. army air forces.

In the former category, few new services were added—in some instances least essential routes and schedules were curtailed in order to utilize available equipment more efficiently. On May 1, 1942, domestic airlines were operating 324 aircraft. They then began releasing equipment to the government to meet needs of the military services and lend-lease commitments. By the end of 1942 only 166 aeroplanes remained in operation, yet by virtue of more efficient utilization, particularly in faster maintenance and increased load factors, airlines were moving a volume of traffic comparable to that of the preceding year.

Approximately 3,752,000 passengers were carried in 1942 as compared with 4,060,545 in 1941. Plane miles flown decreased from 133,022,679 mi. in 1941 to approximately 105,000,000 in 1942. Passenger miles flown were 1,483,544,417 as compared with 1,491,734,671 in 1941. Air express increased phenomenally from 10,485,058,005 lb.-miles in 1941 to approximately 22,043,748,000 in 1942.

Early in the year a system of priorities for airline passengers was established, under control of the military. However, priority passengers were kept to a reasonable minimum, and throughout the year ordinary civilians were generally able to obtain seats except during brief temporary periods of congestion on certain routes.

All applications to the Civil Aeronautics board for new routes were held in abeyance unless hearings were requested by army, navy or state department for strategic reasons. One such exception was the new route opened by American Airlines in early fall to Monterrey and Mexico City. This provided direct connections from both east and west coasts of the U.S. to the neighbouring republic.

Major airlines greatly expanded training facilities for both flight crews and ground personnel. In many instances these schools trained airmen for the army and navy aviation branches in addition to those required for the airlines' own operations.

The second category of airline activities comprised contract operations under control and direction of the air transport command of the army air forces. Although strictly a military project, it is pertinent to any discussion of civil aviation by virtue of its postwar implications.

A majority of the aeroplanes requisitioned from the domestic airlines were employed for this purpose, plus whole fleets of new transports produced and delivered during the year. Various airlines were assigned specific routes and provided with equipment to handle schedules. Largely cargo operations, the significant point is that they were conducted by civilian airline management and personnel.

The scope of operations can be told only in general terms. Routes extended from terminals in the U.S. to Dutch Harbor, Nome and other points in Alaska; to Pacific island bases, New Zealand and Australia; to England, Scotland, Ireland and intermediate bases; to Central and South America, Africa, Russia and India.

Thus, at year's end American commercial airlines had achieved a scope of world cargo and passenger operations, under pressure of war needs, which even the most farsighted proponents of air transport had not expected to see for many years to come.

The fleets of aircraft so used to transport troops, weapons, ammunition, supplies and parts to allied units in all parts of the world numbered many hundreds. Flying equipment comprised Douglas DC-3s and their military counterparts, with gross weights from 25,000 to 30,000 lb.; giant 4-engine Douglas C-54 Skymasters with gross weights of 52,000 lb.; Lockheed C-60 Lodestars, 17,500 lb. gross; Curtiss C-46 Commandos grossing 50,000 lb.; and the Consolidated C-87s, transport versions of the famous long range 4-engine Liberator bombers. There were also many old Boeing 247s, first modern, all-metal twin-engine design, still doing yeoman duty after many years of service on the airlines.

With over 20% of all U.S. multi-engine aircraft produced in 1943 scheduled to be cargo planes, the aerial supply trains shuttling over the U.S.'s world network inevitably would number many thousands before the end of that year.

Civilian Flying in the U.S.—Outstanding development in civilian flying, other than airline operations, was the achievement of the civil air patrol (C.A.P.), a nation-wide volunteer organization set up under the Office of Civilian Defense. Squadrons and flights, organized under state wing commands, comprised over 65,000 civilian volunteers with units at more than 1,000 airports.

Rigorous flight and ground training programs were established in co-operation with the army air forces to prepare members for many types of special missions important to the war effort. Thousands of members contributed their services on long missions for expense money merely sufficient to cover bare living expenses, and plane owners contributed their equipment for a moderate hourly rental for the time actually spent in the air.

C.A.P. coastal patrols were established. They maintained constant watch for enemy submarines along U.S. shores. Submarines spotted by these patrols were sunk. On occasions, subs about to attack vessels crash-dived at the approach of C.A.P. planes. Vessels in distress were assisted and hundreds of survivors of torpedoings were located for rescue by surface ships.

Such work was done under command of C.A.P.'s own volunteer officers under the general supervision of the army air forces. Most of the pilots were ineligible for military service. Many were flyers in World War I, but too old for combat service in World War II. Thousands of other members went out of the C.A.P. to the armed services, the air transport command, the airlines and pilot training schools, better prepared by reason of their C.A.P. training and experience.

Second in importance only to the coastal patrols were the courier services operated for the army. These consisted of flying officers, dispatches and rush shipments between military posts and production centres. Other missions included aerial target towing, reconnaissance and inspection flights, searchlight and gunnery tracking and forest patrol. In natural disasters, such as floods and tornadoes, local units turned out for rescue flights, carrying doctors, nurses and medical supplies.

In these ways private pilots and plane owners were enabled to continue their flying activities, at the same time contributing directly to the war effort. Another important factor was that local interest in flying was maintained at a high pitch in communities throughout the country.

Civil flying other than C.A.P. and airline was prohibited in zones extending along borders and coastlines and strictly controlled in the interior.

Production of Civil Planes.—In 1942 there were no planes produced for purely civilian purposes other than for training or transport. All production figures were restricted except for the 48,000 total of all aircraft produced announced by the president. This compared with an overall total of approximately 28,000 planes produced in 1941. It is interesting to note that a large proportion of the aircraft produced, however, was equivalent to types which would be classified as civil in peacetime. This was particularly true of transport aircraft and light planes in the 65–125 h.p. category.

In the latter case, such planes were destined for preliminary and primary training, and for observation and liaison missions in co-operation with ground forces of the army.

Technical Developments.—There were no radically new types of civil aircraft or engines introduced in 1942. There were, however, numerous developments in the science of aeronautics which would be applicable to civil aircraft after the war.

Most of these could not be described in detail because of military secrecy.

The Lockheed C-69 Constellation, originally designed as a 57-passenger transport for airlines, was modified to serve as a cargo plane and the prototype successfully completed its first flight early in 1943. It was a 4-engine landplane with tricycle landing gear, boasting greater power, speed and load carrying capacity than any other U.S. transport in service.

The Douglas C-54 Skymaster, originally designated the DC-4 and designed to specifications of U.S. airlines, was redesigned as a military transport and got into quantity production in 1942.

Design of the Curtiss C-76 Caravan was completed in 1942 and preparations made for large-scale production. It is a high-wing twin-engine design, constructed largely of wood and plastic bonded plywood. Its structure incorporates a maximum of non-strategic materials and its design is aimed at utilizing woodworking and other production facilities unsuited to manufacture of conventional metal aircraft. Its fuselage, unusually wide and deep, is rectangular in cross-section. The entire nose section swings open to provide an unobstructed loading door near ground level.

Powerplants of all types were vastly improved. Air-cooled radial engines with outputs far in excess of 2,000 h.p. were known to be in production. Liquid-cooled engines reached new heights of efficiency and reliability and were produced in unprecedented numbers. Power output of light-plane engines was likewise increased.

Plastic bonded plywood, moulded to form under heat and pressure, came into wide use for trainers and smaller aircraft to conserve critical metals for combat craft. Even so, the transport mentioned and certain combat craft were planned to utilize the same method of construction. Possible applications of the light metal, magnesium, in aircraft were greatly expanded with the development of "Heliarc" welding, a process utilizing helium to weld magnesium alloys easily and quickly, hitherto a well-nigh impossible task.

Development of superchargers and pressure cabins for high altitude flight was accelerated. The automotive industry achieved a remarkable conversion to production of aircraft and aircraft engines, the full force of which would not be felt until 1943. New production techniques evolved by both industries materially reduced the time and labour required to build a given aeroplane. Much helicopter and other experimentation was conducted in strictest secrecy, but Igor Sikorsky's successful helicopter was brought to a stage of development which gave high promise of military and commercial feasibility in the immediate future.

Avila Camacho Manuel (1897–), president of Mexico, was born at Teziutlan in the state of Puebla on April 24. After completing a course of commercial studies in his native town, he joined the successful revolution against Victoriano Huerta in 1914 and advanced to the rank of general of division. In the cabinet of President Rodriguez he was minister of war and navy. President Cárdenas later appointed him secretary of national defense and personally selected him as successor to the presidency. He was elected president July 7, 1940, by 2,476,641 votes to 151,101 for his opponent, Gen. Juan Andreu Almazán, according to tabulations of the Mexican congress. The new president was inaugurated Dec. 1, 1940.

During 1941 he negotiated a settlement of the oil-expropriation controversy with the United States. He consistently stressed hemispheric solidarity in defense and on May 22, 1942, three weeks after a German submarine had sunk a Mexican ship, Avila Camacho called for war against the axis The congress unanimously approved his demand and on June 2 he signed the declaration of war against Germany, Italy and Japan (which was made retroactive to May 22) and Mexico joined the United Nations. (*See* also MEXICO.)

Ayala, Eusebio (1875–1942), Paraguayan statesman, was born Aug. 14 of French parents in Barrero Grande, Paraguay. He received his degrees of doctor of law and social sciences from Asunción university in 1900 and later taught philosophy, political law and sociology. Ayala was elected senator three times from Asunción and was president of the chamber of deputies in 1910. He held a number of portfolios in the cabinet and was provisional president from 1921 to 1923. He was minister to Washington in 1925, and again in 1931, when he tried to enlist the services of the United States as mediator in the Gran Chaco dispute. In 1932, Ayala became president of Paraguay. A year later Paraguay declared war on Bolivia, a conflict that lasted for three years. The discontent arising in Paraguay over the peace terms led to open revolt in 1936. Ayala was ousted and fled to Argentina, where he lived until his death in Buenos Aires, June 4.

Azores, The: *see* PORTUGUESE COLONIAL EMPIRE.

Bacon. Reports of bacon production in the United States, normally printed in considerable detail, disappeared from trade publications in 1942, and even the usually well informed American Meat institute had no figures on the output for 1942. Bacon was a staple in the ration of United States military forces. It was said that publication of data on bacon might, indirectly, be the means of giving information to the enemy. Lend-lease shipments of Wiltshire sides, which are roughly a British equivalent of bacon, were reported by the Agricultural Marketing administration as 149,465,000 lb. from March 1941 to Jan. 1943. The Canadian Bacon board and the British government made a new contract in Oct. 1942, calling for an increase in shipments of bacon and pork cuts from 600,000,000 lb. to 675,000,000 lb. The price for grade A Wiltshire sides was increased from $19.77 to $21.75 per cwt. (*See* also HOGS; MEAT.) (S. O. R.)

Bacteriology. The progress of bacteriology during 1942 showed a gratifying correlation of technical discovery, microbiological study and medical practice. Study of bacterial metabolism, perhaps regarded by the too practical minded as a subject fit only for academic pure bacteriology, by discovering the nutritive requirements of bacteria, also revealed their vulnerability. The work of Wood illustrates this in his conclusion that "Sulphonamide drugs . . . exert their bacteriostatic effect by competing with the essential metabolite, p-aminobenzoic acid, for an important enzyme site on the bacterial cell." The sulphonamides are antiseptics with little germicidal activity. Their bacteriostatic effects may be neutralized by p-aminobenzoic acid and similar compounds. Since such compounds are found in purulent exudates, the discovery has clinical implications. Nevertheless, the topical use of sulphonamide powders was proving of immense value in the treatment of war wounds.

In previous decades the public and the medical profession tended to evaluate antiseptics almost wholly by their germicidal activity. It appeared in 1942 that some antiseptics which are highly bacteriostatic and less germicidal may be none-the-less valuable prophylactic or therapeutic agents. Bacterial cells, notably the sporulating anaerobes, thought to have been killed by mercurial and silver compounds, are found to be viable in Brewer's thioglycollate medium which not only neutralizes the mercurial or silver antiseptic but also supports growth of aerobic and anaerobic bacteria. Such a medium was being recommended in 1942 by the U.S. Food and Drug administration for testing the sterility of biologicals and other ampule preparations.

Bacteriologists of experience, whether working with pathogenic or nonpathogenic bacteria, frequently noted that certain bacteria did not survive in mixed culture with other microorganisms: the phenomenon of microbial antagonism. It was also reported of viruses. This phenomenon also gives promise of therapeutic usefulness.

Progress was made in the discovery and isolation of these antibacterial products in relative purity from fungi, actinomycetes and bacteria. Waksman and Woodruff presented a good review of the subject.

Brucellosis continued to inspire sensational popular magazine articles, the interest of scientific investigators and the attention of practicing physicians and veterinarians. It probably deserved neither the fear inspired by popular authors nor the disregard of the lay public.

Huddleson recently presented a sobering appraisal of immunity in Brucellosis which should help to place this infection in truer perspective.

Considerable attention was given to a group of minute, pleomorphic, gram-negative, micro-aerophilic organisms resembling that causing pleuropneumonia in cattle. It appeared that such organisms are commonly harboured by rats and may infect man. Brown and Nunemaker presented evidence that many cases of rat-bite fever (probably identical with Haverhill fever), hitherto thought to be caused by a spiral organism, may be caused by *Streptobacillus moniliformis* (probably an illegitimate name), the systematic position of which was doubtful.

The possibility of more adequate study and classification of spirochetes was opened by Wichelhausen and Wichelhausen who reported the cultivation of these organisms as colonies in and on blood agar plates.

Following the work of Lancefield, the serological grouping of haemolytic streptococci appeared to be of immense importance as a guide to diagnosis, epidemiology and therapy. It is gratifying to report that Solowey made a beginning with a similar grouping of viridans streptococci. (*See* also EPIDEMICS AND PUBLIC HEALTH CONTROL.)

Badminton.

David Guthrie Freeman of Pasadena, Calif., one of the finest racket players of all time, became a four-time national champion with his easy victory in the annual 1942 badminton tournament. The blond, 21-year-old Californian, who also is outstanding at lawn and table tennis, again defeated Carl Loveday of Montclair, N.J., in the final, 15–5, 15–10.

Freeman teamed with Chester Goss, also of Pasadena, to annex the men's doubles title.

Evelyn Boldrick of San Diego won the singles championship and teamed with Janet Wright of San Francisco to take the doubles. Miss Boldrick defeated Miss Wright in the singles final, 12–10, 12–3, and then paired with the defeated finalist to score a 17–15, 15–10 victory over Mrs. Roy Bergman, Westport, Conn., and Helen Gibson, Stamford, Conn., in the doubles final.

Sam Leland Gustavson, Westport, and F. N. Hinds, New York city, captured the national men's veteran doubles championship. They defeated F. Don Richardson of Brookline, Mass., and Phil Richardson of Boston, 15–5, 5–15, 17–15, in the final. (M. P. W).

DAVE FREEMAN won his fourth straight U.S. badminton singles championship at Montclair, N.J., April 4, 1942. Here he is shown making a save while lying on his side

Bahamas.

A British colony and island group lying east and southeast of Florida, with an appointed governor and legislative council, and an elected assembly. Area, 4,404 sq.mi.; pop. (1940 est.): 66,219 (1931 census: 59,828); capital, Nassau (on New Providence island), pop. 19,756; governor in 1942: H.R.H. the duke of Windsor.

History.—Bahaman development during 1942 was more acutely affected by war conditions than in 1941, owing to United States participation in hostilities. The war was felt in shortages of goods owing to lack of shipping and in a rising cost of living. Declining tourist trade forced an early closing of many hotels. On the night of May 31, serious rioting broke out in New Providence, the outgrowth of a labour dispute. Two of the 88 rioters were killed.

Education.—In 1940 there were 64 non-sectarian (9,944 enrolment) and 57 aided schools (2,981 enrolment), an industrial school (101 enrolment), and 46 denominational and private schools (2,761 enrolment). Government outlay for education in 1940 was £31,344.

Finance.—The monetary unit is the pound sterling (value in 1942 about $4.03½). Government revenues for 1942 were estimated at £394,690, expenditures £439,889.

Trade.—No very recent trade totals were available in 1942. In 1940, imports totalled £1,284,417 value, exports £229,140. Both imports and exports increased in value in 1941. The principal imports are foodstuffs; liquors, wines and tobacco; and manufactured goods, provided largely by Great Britain, Canada and the United States. The chief exports are fresh tomatoes (to Canada), timber, bark, and marine products, mostly to the United States and Canada.

Resources.—The tourist trade is normally the backbone of the colony's economy. During 1941, 25,000 tourists were estimated to have spent $4,000,000 in the colony. Tourist trade fell off sharply in 1942, however. Sponges formerly constituted a major export, but owing to prevalence of disease, all sponging grounds were closed during 1941 and 1942. Sisal development in the Outer Islands was greatly stimulated in 1942 by an agreement on the part of the United States to buy all the output. A 10-year contract for export of Bahaman spices (chili peppers, dill, fennel, ginger, paprika, pimientos, sesame seed, thyme and turmeric) to the United States was likewise made.

Communication.—External communication is by air, with five to seven flights weekly from Miami to Nassau in 1942, and by boat. Under war conditions, sea traffic during 1942 was almost entirely by small boats. (*See* also West Indies, British.)

Bailey, Vernon (1864–1942), U.S. biologist, was born June 21 in Manchester, Mich. He retired from the department of agriculture's biological survey bureau in 1933, but had continued to serve as consultant on special projects. He had designed the widely used "foothold" trap and the beaver trap providing more humane treatment for animals than had earlier traps. He was the author of a number of books on mammals, birds and plants. He died in Washington, D.C., April 20. (See *Encyclopædia Britannica.*)

Baillet-Latour, Count Henry de (1876–1942), Belgian sportsman, was born March 1 and studied at the University of Louvain. He became connected with the Olympic games in 1903 when he was made head of the Belgian Olympic committee. In 1925, he became president of the International Olympic committee, succeeding Baron Pierre de Coubertin. Count Baillet-Latour was the centre of much controversy when it was announced that the Olympic games would take place in Berlin in 1936. U.S. sport circles opposed this selection, charging that Germany violated the spirit of the Olympic games by discriminating against Jews and non-nazi athletes. Baillet-Latour won assurances that the reich would remove all anti-Semitic signs throughout the country during the games, and the meeting was opened on schedule with U.S. athletes participating. He died at his home in Brussels, according to a broadcast from Berlin, Jan. 7.

Baltic States: *see* Estonia; Latvia; Lithuania.

Baltimore. Seventh largest city of the United States, Baltimore, Md. had a population by the 1940 federal census of 859,100. White population 692,705, non-white 166,395, mainly Negro (19.4%). Area, 78.5 sq.mi. plus 13.35 sq.mi. of water. Mayor (Jan. 1, 1943) Howard W. Jackson.

Adjustments to booming war industries constituted the main problems of 1942. Migration after 1940 caused by the demand for workers in war plants increased the city's population rapidly in 1942 and caused housing and transportation shortages. A Defense Housing bureau was established, and the Maryland Committee on Wartime Transportation put a plan in operation for staggering working and school hours to relieve transportation congestion.

The gross funded debt as of Aug. 31, 1942 was $172,822,079.50; the net general debt (Aug. 31, 1942), $89,445,773. The tax rate remained unchanged at $2.65 per hundred. A bond issue for $32,000,000 to extend water facilities was defeated by a 3 to 1 vote in 1942.

Business activities for 1942 broke all records in Baltimore. The Baltimore Transit company reported an increase in revenue passengers of 39.6% over 1941. Electricity sales increased 13.8% for the first 11 months of 1942 and gas sales 8.1%. Bank clearings in 1942 were $6,346,265,211, an increase of $918,553,431 over 1941. Bank deposits also increased. War industries and steel plants accelerated operations to the fullest extent of available materials and workers. Shipbuilding and aircraft plants maintained or exceeded schedules. Sixteen new industries and expansions in 90 plants were announced. More than 50,000 additional workers were employed in new plants during 1942, making a total of approximately 260,000 employed in Baltimore industries. (C. B. S.)

Bananas. Unusual expedients were adopted in 1942 for relief of banana growers in the western hemisphere, where wartime lack of marine shipping had severely restricted the banana trade. In addition further inroads of the sigatoka plant disease seriously affected certain areas and was apparently wiping out the once prosperous banana business in Mexico.

The U.S. Board of Economic Welfare and the Defense Supplies corporation (a subsidiary of the RFC) reported in Nov., 1942, that contracts had been made with the United Fruit Co. to put 40,000 acres of abandoned banana land into cultivation of abaca, the source of Manila hemp, in Panama, Costa Rica and Guatemala. Employment was given more than 1,000 banana workers in Honduras by co-operative effort of the Institute of Inter-American Affairs and the Honduras government in the construction of a highway from Poterillos to Lake Yojoa.

It was estimated Mexico would ship 2,800,000 bunches of bananas to the United States in 1942. In 1937, the peak year, Mexico exported 14,750,000 stems to the United States. The next year the sigatoka disease began making rapid inroads and production steadily declined, being only 4,400,000 stems in 1941. In 1942 about 75% of the exports went by rail, owing to shortage of marine shipping. Formerly 80% of the exports were by water. The one optimistic note in the banana industry in 1942 came from Palestine, where production of 10,000 tons from 2,250 ac. was reported. Only 750 ac. of bananas were planted in Palestine in 1939. (S. O. R.)

Bankers Association, American: *see* American Bankers Association.

Bank for International Settlements. The broadening scope of World War II, both as to area involved and populations affected, as well as the intensification of its economic and financial aspects, resulted in further curtailment in 1942 of the volume of business transacted by the Bank for International Settlements. Nevertheless, central banks and monetary institutions throughout the world continued to co-operate with the bank.

President Thomas H. McKittrick, reporting at the annual meeting June 8, 1942, at Basle, Switzerland, declared that the bank had consistently adhered to the principles of scrupulous neutrality which it had laid down for itself in the autumn of 1939, avoiding all transactions whereby any question could possibly arise of conferring economic or financial advantages on any belligerent nation to the detriment of another.

For the 12th fiscal year, ending March 31, 1942, net profits after provision for contingencies, amounted to 5,185,686 Swiss gold francs, compared with a profit of 5,293,909 Swiss gold francs for the previous year. After required allotment to the legal reserve of a sum equal to 5% of net profits, amounting in 1942 to 259,284 Swiss gold francs, there remained available for dividend payment 4,926,401 Swiss gold francs, equal to nearly 4% of the paid-up capital. The special reserve fund was drawn upon to the extent of 2,573,589 Swiss gold francs in order to permit distribution of the usual 6% dividend.

The balance sheet total declined 19,200,000 Swiss gold francs during the fiscal year, standing at 476,600,000 Swiss gold francs on March 31, 1942. The drop was attributed to reductions in various categories of deposits. There was a spurt to 484,788,967 by June 30, but on Aug. 31 the balance sheet total stood at only 472,554,469 Swiss gold francs. Earmarked gold not entered in the balance sheet totalled 51,600,000 Swiss gold francs on March 31, 1942, compared with 65,100,000 at the end of the previous fiscal year.

Although its usefulness in financing international trade was practically stopped by the war, the bank was of great value as banker for the international Red Cross organizations operating from Switzerland.

Banking.

The requirements of total war governed banking in the U.S. during 1942. The great increase in government borrowing was facilitated by the 14,773 Commercial and Savings banks of the country not only by purchases for their own portfolios but by active selling campaigns among their customers, culminating in the sale of more than $12,000,000,000 in government bonds in the single month of December. Deposits of all banks grew rapidly to an all-time high of $72,382,000,000. Loans and investments increased to new high levels of $25,078,000,000 and $38,897,000,000 respectively on June 30.

Membership in the federal reserve system increased to 6,647 banks with deposits on Sept. 24, 1942, of $54,381,000,000, up more than $4,000,000,000 from September 1941. Member bank excess reserve balances with the Federal Reserve banks continued their decline from the peak of $7,000,000,000 in 1940 to a low point in Sept. 1942 of $1,690,000,000, largely as a result of increased deposits and a steady growth in the volume of money in circulation to more than $15,000,000,000, up from $11,160,000,000 on Dec. 31, 1941. The principal offsetting influence was the open market purchases of U.S. government securities for federal reserve system account which grew to substantial proportions toward the end of the year. Under an amendment to the Federal Reserve act, the board reduced reserve requirements of banks in the two reserve cities, New York and Chicago, from 26% to 20%, the same level as reserve city banks. This adjustment was made necessary by the fact that the government raised more funds in New York and Chicago by taxation and borrowing than it spent there, resulting in a drain of funds to meet payments in widely scattered war-industry centres.

Loans expanded moderately, and the proportion of war loans to non-war loans increased during 1942. An executive order authorized the war and navy departments and the Maritime commission to guarantee commercial banks against loss on loans made to finance the performance of war orders under a provision known as Regulation V. Such loans were used by many corporations engaged in war work. Regulation W was amended to further discourage credit and instalment buying, and cash instalment loans of lending institutions were subjected to the regulation. Consumer instalment credit declined substantially from its peak in the summer of 1941. (*See* also CONSUMER CREDIT.)

Investments of member banks expanded mainly in U.S. government obligations, which accounted for $24,098,000,000 of a total of $29,872,000,000 of investments held June 30. Long term interest rates were relatively stable but short and medium term rates firmed up materially during the year. Gross earnings of banks were somewhat higher but expenses increased nearly as much. Service charges and trust department earnings continued to contribute substantially to total income. The influence of the Federal Deposit Insurance corporation (*q.v.*) was felt in building up from earnings the capital funds of the banks in keeping with increased deposit liabilities. In addition to treasury orders affecting foreign funds, the Alien Property Custodian required the filing of returns covering all accounts of enemy aliens. Banking personnel contributed liberally to the armed forces and as a result women employees were taken on to a greater extent than ever before.

With the prospect that widespread rationing of commodities would be introduced on a national scale, "ration banking" was begun as an experiment and the American Bankers association prepared plans for further development of this method of facilitating the use of ration coupons. The banking system would thus accept deposits of ration coupons from retailers who would then draw drafts in favour of the wholesalers. (*See* also BUSINESS REVIEW; LAW; RATIONING.)

Canada.—World War II continued to govern banking in Canada during 1942 as all business concentrated on production for war uses. Net deposits of the ten chartered banks expanded nearly half a billion dollars to $3,486,000,000 during the year ended Sept. 30, 1942. At the same time holdings of securities, chiefly dominion and provincial, increased $600,000,000 to a new high of $2,340,000,000, but current loans receded $183,000,000 to $1,050,000,000. Reduced revenue from loans and increased taxes in some cases caused a reduction in dividends to stockholders. In spite of the increased demand for banking services for the armed forces, industry and the public, it became necessary to close many branches. As manpower was drawn to the armed forces and war industry, banking services faced curtailment and the proportion of women employees rose from less than 22% at the start of the war to more than 52%. Farm production and war industry reached new peaks, and although civilian production was severely reduced, the national income was at a new high. Taxes were again increased to aid in financing the war effort. The Bank of Canada more than doubled its holdings of dominion and provincial securities and on October 31 held nearly $1,000,000,000 of these issues. Note circulation increased from $448,900,000 to $657,600,000.

Great Britain.—Wartime banking continued to follow the pattern set in previous years as the entire economy of the country was devoted to war activities. The eleven London clearing banks reported deposits at the new high level of £3,358,000,000, while loans fell off slightly to £785,000,000 and holdings of securities, chiefly government issues, reached a new peak of £1,097,000,000 at the end of September 1942. Open market interest rates remained at the same low levels of the previous year. The banks were urged to close more branches, reduce services to the public and all non-essential activities and adapt themselves completely to wartime working methods. The Bank of England reported a new high in British bank note circulation at £870,000,000 on Nov. 27, 1942. (*See* also BANK OF ENGLAND.)

Europe.—Banking on the continent of Europe during 1942 was entirely under the domination of Germany, with the minor exceptions of Portugal, Spain, Sweden and Switzerland. The Reichsbank reported increased deposits, and note circulation expanded more than 5,000,000,000 reichsmarks under the burdens of war to a total of 21,344,000,000 during the year ended July 31, 1942. Interest rates were said to remain stable under strict government control. Information available to the outside world on commercial banking operations was non-existent. The Bank of France reported note circulation increased by 62,000,000,000 francs to a total of 304,379,000,000 francs, while advances to the government to cover the costs of the German army of occupation grew to a total of 181,000,000,000 francs by June 11, 1942. The Bank for International Settlements (*q.v.*) at Basle, Switzerland continued to function but on a greatly reduced scale and mainly to collect interest on routine transactions.

Investment Banking.—Coincident with an unprecedented volume of financing by the United States government for war purposes, the volume of corporate and municipal financing fell to the lowest level in several years. For the eleven months ending Dec. 1, 1942, such issues totalled $1,977,413,000 as compared with $5,301,007,000 for the like period in 1941. Refunding issues accounted for nearly half the total volume, new capital representing only $1,045,447,000. A trend was noted toward financing municipal acquisitions of utilities by the issuance of bonds secured only by the revenues of such utilities. Corporate financing for the month of November fell to $18,209,000, the lowest level since January 1935, and all but 3% was sold privately, a practice developed during the year. Corporations needing additional capital for the most part availed themselves of bank loans. Municipal finances were relieved by the improved employment situation, but certain other effects of the war produced maladjustments, such as changes in industrial areas and reduced collections on gasoline and automobile licence taxes and bridge tolls. Of the new municipal issues, more than one-third represented refunding of outstanding bonds.

Decreased activity in investment banking led to further mergers of banking houses, and an increasing number of partners and employees found opportunities to serve the country in the armed forces, in government service or in war industries. As war financing progressed, the investment banking community threw its organization into the campaign to sell government bonds to the general public as distinguished from the commercial banks, to minimize the dangers of inflation. Government borrowing monopolized the investment markets during the year, offering $49,830,332,000 in bonds, notes and bills during the first 11 months, of which $12,366,857,000 represented refundings of maturing issues. In addition, the December campaign accounted for over $12,000,000,000 in a program offering several different types and maturities of bonds, certificates of indebtedness and tax anticipation notes designed to suit every variety of investor. The banking system absorbed about 40% of the total, the rest going to individuals and institutions. The government stressed the desirability of absorbing part of the increased purchasing power of the public by the sale of series E savings bonds through payroll deduction. Nearly $7,000,000,000 of this issue alone had been sold in 1942, and redemptions totalled only 3%. (E. B. L.)

War Savings Bond Sales.—The entry of the United States into World War II in December 1941, brought with it inevitable changes in the savings habits of the U.S. people. A patriotic desire to make a personal contribution to the war effort caused many depositors to divert their accumulated savings to the purchase of war savings bonds. For sales of war savings bonds of the various issues, see the accompanying table.

Sales of War Savings Bonds, 1941-42

(In Millions of Dollars)

Month	Amount outstanding at end of month	Funds received from sales during month			
		All Series	Series E	Series F	Series G
1941—November . . .	5,620	234	110	19	105
December . . .	6,140	529	341	33	154
1942—January	7,198	1,061	667	78	316
February	7,893	703	398	52	253
March	8,436	558	338	41	179
April	8,951	531	327	40	164
May	9,569	634	422	43	170
June	10,188	634	433	41	160
July	11,078	901	508	74	319
August	11,751	697	454	52	191
September . . .	12,479	755	510	61	184
October	13,381	935	665	61	210

Special club accounts, generally called Victory accounts, were made available by the savings banks for individuals who wished to save regularly to purchase war savings bonds. Payroll allotment plans under which authorized deductions are made from employees' wages and salaries to buy bonds have been set up to assist employers who are not equipped to handle the details of such plans in their own organizations.

Mutual Savings Banks.—After the United States had been in the war a few months, the first excitement subsided and current deposits in mutual savings banks again exceeded current withdrawals. Total assets on July 1, 1942, were $11,677,000,000 and deposits credited to 15,674,831 accounts totalled $10,354,000,000. The combined surplus was $1,282,000,000 or 12.39% of deposits. Dividends averaged 1.88% in 1942, a slight decline from the average of 1.90% paid in 1941. Two banks were absorbed by merger during the year ending July 1, 1942, and one bank was absorbed after that date, so that the total number of mutual savings banks was reduced to 535 at the end of the year.

Mutual savings banks were from the first ardent supporters of the program for financing defense. By Dec. 1, 1941 there were 506 mutual savings banks qualified as issuing agents for U.S. defense savings bonds series E. In the preceding seven months period the savings banks had distributed $119,056,650 par value of defense bonds, of which $91,237,588 were series E, $5,023,940 were series F, $21,645,486 were series G and $1,149,656 were defense savings stamps.

After the United States entered the war, several changes were made in the original financing program to meet the needs of a country at war. In May 1942, the defense savings bonds became war savings bonds, and as of Dec. 1, 1942, the series F and series G bonds became simply U.S. savings bonds. With this latter change the active promotion of series F and series G bonds was transferred from the War Savings staffs to the Victory committees, who promoted also the sale of other issues intended for every type of large investor. The War Savings staff concentrated chiefly on series E bonds, and in this effort they had the active co-operation of the mutual savings banks. In the 11 months ending Nov. 1, 1942 the mutual savings banks distributed $529,666,969 par value of war savings bonds and stamps of which $429,748,682 were series E, $17,738,926 were series F, $71,502,752 were series G and $10,676,609 were stamps. Many savings banks purchased series F or series G bonds for their own portfolios to the full limit allowed of $100,000 per year.

Savings Bank Life Insurance.—When the sale of savings bank life insurance was legalized in Connecticut in 1941, the number of banks which were eligible to establish this service was increased to nearly three-fourths of the mutual savings banks in the United States. Connecticut, Massachusetts and New York together had 395 savings banks in 1942 with deposits of $8,350,000,000 credited to 12,000,000 accounts. One million dollars of savings bank life insurance was sold in Connecticut in the first 10 months of operation. The total insurance in force on Oct. 31, 1942, was $1,013,950, representing 1,147 policies.

In New York state, which established savings bank life insurance in 1938, there were 26 issuing banks and 18 agency banks on Oct. 31, 1942, an increase of four issuing banks and one agency bank during the year. On Oct. 31, 1942, there was $28,083,000 of insurance in force, representing 33,472 policies, an increase of $10,258,000 in insurance in force and of 11,532 policies since Oct. 31, 1941. In Massachusetts there were 30 issuing banks and 110 agency banks on Oct. 31, 1942. The total insurance in force was $223,063,000, representing 246,606 policies.

British Savings Banks.—The fiscal year for Trustee Savings banks in Great Britain ends on Nov. 20. The August 31st statement, formerly published in the *Trustee Savings Bank Gazette,* official organ of the Trustee Savings Banks association, was omitted in 1942, hence the figures for Nov. 20, 1941 were the last official data received. Balances in trustee savings banks were £385,585,458 on Nov. 20, 1941 an increase of £53,248,121 for the year ending that date as compared with a gain of £39,706,000 for the previous year.

In addition to investing all of these new deposits in government securities, either directly or through the National Debt commissioners, the trustee savings banks aided in the distribution of special war securities. These four special securities, similar to the issues making up U.S. war financing program, were national savings certificates, defense bonds, savings bonds and war bonds. (He. Br.)

Bank of England.

During 1942 the bank continued to carry out its duties as agent and adviser of the British government on all matters coming within its province. The only major changes in the bank's own conditions were the two increases in the fiduciary issue of £50,000,000 each,—in April and July. The fiduciary issue grew from £300,000,000 before the war to £580,000,000 in Sept. 1939, £730,000,000 in Aug. 1941 and £880,000,000 in July 1942.

The first and biggest war increase was mainly the offset to the transfer of the Bank of England's gold reserve to the exchange equalization account. Subsequent increases arose entirely from the public's growing demand for currency, mainly due to increased employment and higher earnings and wages. Actually the quantity of coin and notes held by the public and excluding the banks' till-money rose during the war from £465,000,000 to £787,000,000—an increase of £322,000,000, compared with the war expansion of £300,000,000 in the fiduciary issue.

The bank continued its routine work in connection with the issue of government loans. Thus in May 1942, the former issue of 3% savings bonds, 1955–65, gave way to a new issue of 3% savings bonds, 1960–70. The weekly offer of treasury bills, made by the bank as agent to the government, remained at £75,000,000 until the beginning of October, when it was temporarily raised first to £80,000,000 and then to £85,000,000. This change was expected to provide the banks with more maturities early in 1943 which would assist them in connection with the heavy tax payments then due by their customers.

During the summer, the government decided to permit the conversion of industrial debentures carrying interest at over 4%, provided that the terms of issue of such debentures permitted conversion. The bank had the task of arranging the terms and dates of such conversions, in order to ensure their orderly appearance without any sudden overloading of the market. It was also decided that there should be no "underwriting" in connection with such conversions. Instead, steps were taken to ensure that any of the new stock not taken up by converters should be held by strong hands.

The bank gave advice and helped to institute the scheme whereby the British banks transferred clothing coupons between retailers, wholesalers and manufacturers. This scheme worked very smoothly.

Early in 1942 the bank had to play its part in the vesting of certain Canadian government and Canadian National railway securities. This step accompanied the generous granting by the Canadian government of an interest-free loan of $700,000,000 to the British government. The stock so vested was taken over by the Canadian authorities, the former British holders receiving sterling in exchange.

Various steps were taken by the bank to adapt the system of exchange control to the changing needs of the war, *e.g.* arrangements were made with the U.S. army in the United Kingdom to make dollars and sterling interchangeable for all official military purposes at 4.03½ free of all charges. A new and simpler rate of exchange of 4/10*d.* per United States dollar notes and coin was fixed for individuals including the personal needs of U.S. troops, and simultaneously the former commission charged by the banks on all such exchanges of currency was abolished. (N. E. C.)

Baptist Church.

The Baptist conventions of 1942 were held under the distinct consciousness of the U.S. involvement in World War II. There was evident, however, markedly different attitudes between those of 1942 and those of 1917. In the 1942 assemblies a deep sense of guilt and obligation found constant expression. A resolution of the Northern convention reads: "We repent of our sin in not making Christ's way more effective throughout the world . . . we express our willingness to do anything for the welfare of our country, regardless of personal cost or sacrifice, which lies within the full sanction of our individual consciences."

Both conventions, Northern and Southern, defended the right of the conscientious objector and apportioned funds to support those in need. The Southern body listed 147 objectors registered with its executive committee. Each expressed concern over the difficulty of providing its quota of chaplains for the armed forces as also for the churches left pastorless. Each gave serious consideration to a post-war program, affirming that permanent peace and world justice, upon which it depends, must be founded upon the Christian principles of love, reconciliation and good will.

There was special rejoicing over increased gifts to the annual convention budgets, missions, education and new objectives due to war needs. To the normal budget of $2,500,000 the Northern Baptist convention had added an emergency fund of $600,000; but the total received from the churches exceeded the combined amount by $133,795.

The Southern convention gave particular attention to Negro education and the war requirements of their great hospital in New Orleans, third in rank among the 275 denominational hospitals of the United States.

The total number of Baptists reported in the United States for 1942 was 11,021,159. Northern, 1,468,043; Southern, 4,949,174; Negro, 4,073,252; other churches, 530,690. World total, 12,986,897. (R. E. E. H.)

Barium Minerals.

Statistics were lacking on baryte production in the United States, but indications available did not point to any appreciable increase over the 1940 level. Small outputs were developing in Canada, Cuba and South Africa. (G. A. Ro.)

Barley.

A new high mark in barley production in the United States, 426,150,000 bu., was registered in 1942 from the largest acreage on record, 16,782,000 ac. The 1942 crop was 18% more than the previous record crop of 1941, when 362,082,000 bu. were harvested from 14,220,000 ac. The 10-year average (1930–39) production was 226,460,000 bu. from 10,732,000 ac. The yield in 1942 was 25.4 bu. per acre, or one-tenth of a bushel less than the 1941 yield. The 10-year average was 20.7 bu. per

acre. Except along the Canadian border, the yields in most states in 1942 were below those of 1941, especially in Iowa, Nebraska and Kansas.

In the Dakotas the crop broke all records. In the northern plains states the crop was damaged by rust, scab and wet weather. Canadian production in 1942 was 259,234,000 bu. compared to 110,566,000 bu. in 1941. (S. O. R.)

Barrymore, John Blythe (1882–1942), U.S. actor and star of stage, screen and radio, was born Feb. 15 in Philadelphia, the son of Maurice and Georgie (Drew) Barrymore. Talented and versatile, he studied art in his youth, and before he was 20 he had worked on two metropolitan newspapers as a cartoonist and illustrator. In 1903 he made his stage debut in a small part in Hermann Sudermann's *Magda.* Thirteen years later he gained his place in serious drama for his notable performance in Galsworthy's *Justice.* From then on he skyrocketed to fame, reaching the peak of his stage career with his interpretation of Hamlet, which won plaudits not only from New York audiences but also from London critics, generally hostile to U.S. actors in Shakespearean roles. Following his success in London, Barrymore returned to the United States and gained screen fame in *Beau Brummel* and *Don Juan,* two box-office successes which earned him the sobriquets of "The Great Profile" and "The Great Lover." The youngest member of the Barrymore "Royal Family," he frequently co-starred with his brother Lionel in motion pictures and appeared with both Lionel and his sister, Ethel, in the film *Rasputin.* In the late 1930s, he slipped to the status of featured player in trivial comedies. In 1939, he made a sensational come-back in a stage comedy, *My Dear Children,* convulsing audiences with his *ad lib* and off-stage remarks. Barrymore then starred in a weekly radio program, lampooning his own name and fame. He died in Hollywood, Calif., May 29.

Baseball. Professional baseball's program for 1942 had its outlines established by the so-called "Green-Light Letter" from the president to Hon. Kenesaw M. Landis, ruling head of organized baseball, which comprises the two major leagues and (in normal years) some 40-odd minor leagues representing about 300 cities throughout the United States and in Canada.

In 1942, a full schedule of games to decide league championships was played in the major leagues—the National and the American—and in 26 minors. Five minor leagues which began play in spring suspended their schedules early in the season because of war economies, the depletion of playing ranks and, in the case of two coastal circuits, army dimout regulations precluded play under arc lights.

The national game became a part of the military programs of training camps and naval bases. Every sizeable base had its own team playing outside games. Every camp or base, large or small, had ball games for service men in recreation periods, so that as a by-product of the mobilization process, facilities for playing baseball were available to a greater number of persons than perhaps any previous year in American history. Professional baseball participated in this trend through its Baseball Equipment fund (*see* below). Because of the far fronts of war operations, the game had a greater geographical scope than ever in its history.

The commander-in-chief's message on baseball was as follows:

THE WHITE HOUSE
Washington

January 15, 1942

My dear Judge:—

Thank you for yours of January fourteenth. As you will, of course, realize, the final decision about the baseball season must rest with you and the Baseball club owners—so what I am going to say is solely a personal and not an official point of view.

I honestly feel that it would be best for the country to keep baseball going. There will be fewer people unemployed and everybody will work longer hours and harder than ever before.

And that means that they ought to have a chance for recreation and for taking their minds off their work even more than before.

Baseball provides a recreation which does not last over two hours or two hours and a half, and which can be got for very little cost. And, incidentally, I hope that night games can be extended because it gives an opportunity to the day shift to see a game occasionally.

As to the players themselves, I know you agree with me that individual players who are of active military or naval age should go, without question, into the services. Even if the actual quality of the teams is lowered by the greater use of older players, this will not dampen the popularity of the sport. Of course, if any individual has some particular aptitude in a trade or profession, he ought to serve the government. That, however, is a matter which I know you can handle with complete justice.

Here is another way of looking at it—if 300 teams use 5,000 or 6,000 players, these players are a definite recreational asset to at least 20,000,000 of their fellow citizens—and that in my judgment is thoroughly worthwhile.

With every best wish,

Very sincerely yours,
(Signed) Franklin D. Roosevelt

Hon. Kenesaw M. Landis,
333 North Michigan Avenue,
Chicago,
Illinois.

The team-of-the-year was the St. Louis Cardinals, who came from far behind, as of mid-August, to win the National league pennant on the last day of the playing season, then overthrew the mighty New York Yankees in the world series, winning four straight games after losing the opening contest. The Yankees had been unbeaten in world series play since 1926, when an earlier St. Louis club vanquished them. In the intervening years they had won the American league pennant eight times and every time had carried through to the world championship, five times by winning four straight games without allowing their National league cotitlists even a single game.

Short-wave radio carried the world series to American armed forces in Alaska, the Canal Zone, Hawaii, Australia, the British Isles, Africa and the near east, in some cases the play-by-play with every ball pitched, in all cases the scores and high lights.

The world series set a new attendance record for a five game series—276,717, gross receipts $1,105,249, of which $362,926 were turned over to the United Service Organizations. The total of direct financial contribution by the two major leagues to various war funds during the year thereby mounted to approximately $1,315,000. The Army Emergency relief, the Navy Relief society and the Baseball Equipment fund were the other chief recipients.

The report of Judge William G. Bramham, president of the National Association of Professional Baseball Leagues, showed that the minor leagues as a whole raised a total of $232,474 for the war funds in 1942.

Sixteen special games, one each on the home grounds of the 16 major league clubs, yielded a total of $523,229 for Army and

THE CHICAGO PUBLIC LIBRA

Navy Relief. The two major league All-Star games, the first played in New York July 6 and the second in Cleveland July 7, provided about $161,000, of which $100,000 went to the Baseball Equipment fund (Ball and Bat fund) and the remainder to the service relief organizations.

The remainder of the B.E.F.'s fund for the year of $133,359 was contributed by the Baseball Writers' Association of America and the treasuries of Commissioner Landis, the two major leagues and of the National Association of Professional Baseball Leagues. All-Star games played by the International league and the Pacific Coast league netted further contributions to the B.E.F. A total of 5,306 "kits" were distributed through army and navy headquarters to camps and bases in 43 states and to units in England, Iceland, Puerto Rico, Bermuda, Trinidad, B.W.I., Canal Zone, Hawaii, Alaska, Australia and Africa, with 2,300 additional kits ready for distribution with the start of the 1943 playing season.

The B.E.F. also arranged with J. G. Taylor Spink, publisher of the *Sporting News*, baseball's weekly newspaper, for the distribution of its paper in camp libraries, ships at sea and oversea units and U.S.O. clubs (about 3,150 weekly).

Supplementing the B.E.F. work of supplying bats, balls and catchers' equipment packed in kits, the two major leagues shipped approximately 1,000 dozen used baseballs to camps and bases during the season. These were foul balls, baseballs driven into the stands and bleachers and returned to the field of play for this purpose. In America in 1942 the foul ball into the stands, formerly the fan's pet souvenir of the ball game, was thrown back to the playing field for the foul ball pool or passed direct to a service man seated near by.

All the clubs in all the leagues made special arrangements for service men on their days off, free tickets, canteen refreshments, etc. Each ball club in its community was a leader in war-civilian activities, holding drives for scrap metal and rubber, signing up fans in the stands as donors for blood banks, establishing booths in the ball parks for sales of war bonds and stamps, etc.

The Associated Press survey of baseball attendance showed a drop of about 8% from 1941 totals in the major leagues, but concluded that "the figures fail to show evidence of a first-class losing trend." The National league attendance topped that of the American for the first time in several years, 4,724,961 to 4,685,614, but both were below 1941, when both passed the 5,000,000 mark.

The 1942 attendance figures, compared with 1941:

	1942	1941	Difference
NATIONAL LEAGUE			
Brooklyn	1,087,860	1,215,772	−127,912
New York	867,614	827,046	+ 40,568
Chicago	591,000	550,000	+ 41,000
St. Louis	571,297	646,190	− 74,893
Pittsburgh	513,285	505,845	+ 7,440
Cincinnati	470,582	654,456	−183,874
Boston	346,249	350,000	− 3,751
Philadelphia	277,074	280,380	− 3,306
Total	4,724,961	5,029,689	−304,728
AMERICAN LEAGUE			
New York	991,314	964,722	+ 26,592
Boston	741,026	760,000	− 18,974
Detroit	630,845	712,257	− 81,412
Cleveland	550,000	850,000	−300,000
Philadelphia	540,038	641,629	−101,591

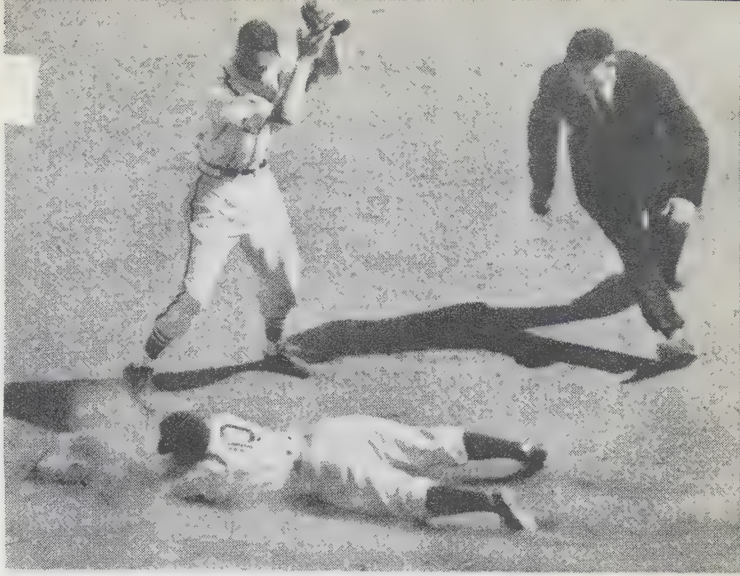
Chicago	426,874	678,911	−252,037
St. Louis	279,987	193,000	+ 86,987
Total	4,685,614	5,220,519	−534,905

Although fewer minor leagues operated, some showed increases. The American association, enrolling Columbus, Milwaukee, Kansas City, Louisville, Minneapolis, Toledo, Indianapolis and St. Paul, recorded a total attendance of 1,669,401, a bulge of about 7.5% over 1941. The Southern association, listing Atlanta, Birmingham, New Orleans, Memphis, Little Rock, Chattanooga, Nashville and Knoxville, reported 743,385, an increase of 59,717 over the previous year. The Canadian-American league, with teams in Utica, Gloversville-Johnstown, Quebec city, Amsterdam, Pittsfield, Oneonta, Three Rivers and Rome, hit a new all-time high of 344,587, which was 16,014 ahead of 1941.



PHIL RIZZUTO of the New York Yankees stealing second base in the second game of the 1942 world series at St. Louis. The St. Louis Cardinals won this game, 4 to 3, and the series, 4 games to 1

The Season.—St. Louis' great team, young compared to its National league cocontender, Brooklyn, and its world series opponent, the Yankees, featured daring base running, backed up by courage under stress, which caught the fancy of the baseball world in their pennant race and world championship finals.

Though chosen as pennant favourite by 46 of the 74 ballots in a preseason poll of baseball writers conducted by the Associated Press, the Cardinals in mid-August were nine and one-half games behind Brooklyn, 1941 champions and runaway pacemakers in spring and early summer, whose rate of victories was only slightly less than the National league's all-time first-half record, set by the New York Giants in 1912.

The Cardinals, in midseason, were a poor second, but in late August and September they turned on all their batting power and base-running speed. Backed up by excellent pitching and brilliant, if sometimes erratic, defensive play, they won 41 of their last 48 games, and clinched the pennant in the middle of Sunday afternoon, Sept. 27, the last day of the season, by winning the first game of their double-header with the Chicago Cubs.

Brooklyn, which as champion had won exactly 100 games in 1941, won 104 in 1942, an all-time high for a Brooklyn team. The Cardinals totalled 106. Only once before in National league history did two clubs reach 100 in the same season, 1909 (Pitts-

burgh 110—Chicago 104); once also in the American League (1915: Boston 101—Detroit 100).

The Yankees swept to their 13th pennant, the American league record, not quite so overwhelmingly as in 1941, when they set an all-time record for early clinching of a league championship, but decisively enough to make them top-heavy favourites for the world series. As late as the middle of the last inning of the opening game of the world series in St. Louis Sept. 30, leading 7 to 0, the picture of Yankee supremacy in world series play held intact. In an unbroken string, 1927, 1928, 1932, 1936, 1937, 1938, 1939 and 1941, they had won every world series for which they qualified.

This picture blew up when the young Redbirds exploded a 9th inning rally, scored four runs, had the bases filled and the potential tying run at bat before the Yanks made the third out. This last-ditch rally sounded the keynote for the series. Starting the following afternoon, the Cardinals served the Yanks their own medicine, four straight defeats. (Scores of the five games: First Game: New York 7; St. Louis 4. Second Game: St. Louis 4; New York 3. Third Game: St. Louis 2; New York 0. Fourth Game: St. Louis 9; New York 6. Fifth Game: St. Louis 4; New York 2.)

In each game the ruling pattern was that of the young Cardinals ever and again teetering on the brink of ruin, but just at the last moment catching hold and flashing brilliant baseball to win the day, a formula entering their series triumph in the all-time gallery of great baseball exploits.

Morton Cooper was Cardinal pitching ace during the pennant race, beating Brooklyn 5 times, totalling 22 triumphs, earning the award of National league's most-valuable-player of the year in the annual Baseball Writers' Association of America balloting. In the world series the Cardinal mound hero was John Beazley, first-year recruit from New Orleans, of the Southern association. Beazley's 21 victories against only 6 defeats during the league season and his 2 world series victories made him the greatest first-year pitcher in National league history since Grover Alexander won 28 and lost 13 in 1911.

In the series second game Beazley shut out the Yankees until the 8th inning, when Charlie Keller's home run with 2 on base tied the score, 3 to 3. Instead of crumbling, however, the Cardinals regained the lead in their half of the 8th on brilliant base running by Enos Slaughter, then, when the Yanks started the 9th with a pair of hits, the same Slaughter nullified the effort by a great throw from his right-field position to third base, shooting down the Yankee base runner carrying the potential tying run.

The scene shifted to Yankee stadium, New York, for the 3rd game, in which Ernie White, St. Louis southpaw, won a 2-0 shut out. This broke another mighty Yankee streak. They had not been shut out in a world series game since Oct. 5, 1926, when a St. Louis pitcher of another generation, Jess Haines, was their master. They had played 40 world series games between those two dates. It was, too, the first time since 1926 they had been defeated in two successive games of a world series.

The Sunday game was attended by a crowd whose numbers set a new all-time high attendance record for a world series game, 69,902. This fourth game combined all the features of all the three former thrillers. The Yankees took the lead, as in the first game. The Cardinals rallied and rolled six runs across the plate in a tempestuous 4th inning, setting up a 6-1 lead. The Yanks put on a furious burst of scoring in the 6th. Keller hit a thunderous home run with two on bases, as in the second game, and the rally tied the score 6 to 6.

And again, as in the second game, the Cardinals, instead of cracking up after their commanding lead was shot from under them, promptly surged out in front, then marshalled shut out southpaw pitching by Max Lanier of the sort furnished by White the day before, holding the winning lead 9 to 6.

In the last game the Cardinals made their triumph complete by using the Yankees' own favourite weapon, the home run. Early in the game Slaughter hit one and with one on base in the 9th Whitey Kurowski, St. Louis third baseman, homered to break the 2-2 tie and crown the Cardinals world champions. Beazley's pitching again baffled the heavy-hitting Yankees throughout the game.

All-Star Games.—American league power was supreme, however, in the 1942 All-Star game between the picked teams of the major leagues, played at the Polo grounds, New York, July 6. In the first inning Lou Boudreau, Cleveland's shortstop manager, and Rudy York, Detroit first baseman, hit home runs to left and right, which scored 3 runs for a 3–1 American league victory, the seventh in ten All-Star games played, starting in 1933. The winning team defeated an All-Star line-up of Service baseball players in Cleveland the following night. The New York attendance of 33,694 was below expectations, but in Cleveland, with an impressive program of military and naval pageantry, the attendance was 62,094.

The Service team, commanded by Lieut. Gordon S. (Mickey) Cochrane, former American league star and manager of Detroit's 1935 world champions, enrolled several major league stars in its line-up, notably Chief Boatswain's Mate Bob Feller, great young Cleveland pitcher, but proved no match for the mighty American League All-Stars, who won 5 to 0.

Individual Achievements.—Joe Gordon, Yankees' second baseman and 1941 world series hero, was voted the American league's most-valuable-player, matching Morton Cooper, receiver of the National league's no. 1 player award. Gordon's all-around play, his batting and fielding, was the chief factor powering the Yankees in the 1942 pennant campaign.

Gordon, New York	103	Medwick, Brooklyn	96
Doerr, Boston	102	Ott, New York	94

Only very exceptional performance ever qualifies a pitcher for the most-valuable-player award. Cooper was the National league's leading pitcher with an earned-run average of 1.77. Since 1919 only once in either of the major leagues has this record been equalled or bettered (Carl Hubbell, 1.66 in 1933). Cooper's record of ten shut outs also tied Hubbell's ten in 1933. This is the closest approach to the major league all-time record of 16 by any National league pitcher since the record was set by Grover Alexander in 1916. Cooper also led his league in victories, with 22 against 7 defeats, and his victory percentage was surpassed only by his junior partner, Beazley, 21 and 6.

The batting champions were Boston players in both leagues, Ted Williams of the Red Sox for the American League, and catcher Ernie Lombardi of the Braves in the National, the second batting crown for each. Williams repeated his 1941 triple exploit of leading his league in batting, home runs and runs batted in. Lombardi was batting champion for Cincinnati in 1938, when he was voted the league's most-valuable-player.

John Mize, New York first baseman, shaded Brooklyn's first baseman, Dolph Camilli, 110 to 109, for the run-driving title in the National. Mel Ott, in his first year as Giants' manager, led the league in home runs, his specialty, since he holds the lifetime home run record for his league.

Tex Hughson of Boston was top winner among American league pitchers, with 22 while losing 6. In percentage, the leader was Ernie Bonham of the Yankees, 21 and 6. Bonham's 6 shut outs led in this department.

The king of American league pitchers for the year was Ted Lyons, the oldest major league pitcher in point of continuous service, whose earned-run average was 2.10, a figure which had been bettered only once in the American league since 1919 (Lefty Grove, 1931, 2.05).

Minor Leagues.—The Junior world series, the class AA playoff between the American association and the International league, was won by the junior partners of the St. Louis Cardinals, the Columbus Redbirds, 4 games to 2. In 1941 Columbus defeated Montreal. In 1942 Syracuse was the International representative.

For the third straight year the Nashville Vols won for the Southern association the honours in the Dixie series, annually played with the Texas league for class A-1 supremacy. It made the fourth straight year in which the Vols represented the Southern, all under the management of Larry Gilbert, former New Orleans player and manager. After losing the 1939 Dixie series to Fort Worth, Gilbert's Vols defeated Houston in 1940, Dallas in 1941 and Shreveport in 1942.

In only seven of the 22 leagues which held play-off rounds among the first-division clubs did the pennant-winning team take play-off honours.

Columbus and Syracuse finished third in the pennant races, while Nashville and Shreveport were second.

The pennant winners in the AA circuits were Kansas City for the American association, Newark for the International and Sacramento in the Pacific Coast league, the third-place Seattle Rainiers capturing play-off honours in the last-named organization. Nashville finished second to Little Rock in the playing season while Beaumont stood ahead of Shreveport in the Texas league.

The seven pennant-winners who swept their play-offs were Greensboro, in the Piedmont league, Cedar Rapids, Indiana-Illinois-Iowa league, Montgomery, Southeastern league, Pulaski, Virginia league, Bristol, Appalachian league, Jamestown, Pennsylvania-Ontario-New York league, and Sheboygan, Wisconsin State league.

Including the Southern and Texas, there were six leagues in which the runner-up won the play-offs. Scranton won in the Eastern league after Albany took the pennant; Macon was play-off winner after Charleston topped the South Atlantic league race; Hagerstown won the Interstate flag, but bowed to Wilmington in the play-offs; Winnipeg took the play-off prize in the Northern league, though Eau Claire finished first in the playing season.

There were three third-place play-off winners, besides Seattle, Columbus and Syracuse; viz., Waycross, in the Georgia-Florida league, in which Valdosta won the pennant; Rocky Mount, Bi-State, whose pennant was won by Wilson; Thomasville, play-off king of the North Carolina State league though the bunting belonged to Concord.

Fourth place play-off winners were Oneonta in the Canadian-American league, Erie in the Middle Atlantic, and Ashland in the Mountain State, with Amsterdam, Charleston and Huntington the respective pennant winners.

Four leagues played split season, winners of the two halves to meet for the pennant. The Appalachian league was the only one in which the same club won both halves, Bristol not only achieving this exploit but winning the play-off round as well.

Boise, second half winner, defeated Pocatello for the Pioneer league pennant. Second half winner won in the Pennsylvania State association, too, Butler defeating Johnstown. It was the first half winner's turn in the Western association, Fort Smith besting Topeka.

The Western International, the only league without a play-off, crowned Vancouver its champion. The final play-off round in the Northern league was cancelled when Wausau, one of the two winners in the preliminary play-offs, disbanded and forfeited to Winnipeg.

Five leagues which started the season suspended before the finish. The Florida East Coast league, with Orlando leading, stopped May 14. On May 30 the Evangeline league suspended, with Natchez in front. The Kentucky-Tennessee league closed its score books June 19, with Fulton ahead. June 28 the California league terminated operations, Santa Barbara in the lead. On July 5 the West Texas-New Mexico league discontinued.

(W. E. Bt.)

Basketball.

The west, as represented by Stanford university and the Denver American Legion, dominated 1942 basketball. Stanford won the National Collegiate Athletic association championship with a 53–38 victory over Dartmouth in the intersectional final. The Denver Legion team emerged from the National A.A.U. championship with the amateur title after defeating Phillips 66 of Bartlesville, Okla., in the tourney final.

On the collegiate front, Dartmouth dominated the east for the fifth consecutive time. Duke continued its hold on the Southern conference, while Kentucky and Georgia shared honours in the Southeastern conference. Illinois dominated midwestern play. Other major conference leaders were: Southwest, Arkansas and Rice; Missouri Valley, Creighton and Oklahoma A. and M.; Big Six, Kansas and Oklahoma; Big Seven, Colorado; Pacific Coast, Stanford (southern division), Oregon State (northern division); New England, Rhode Island.

Basketball, from a spectator standpoint, continued to flourish in the metropolitan areas. Crowds of 18,000 were not uncommon in New York and Chicago, while other sports centres drew smaller, but capacity, gatherings. The National Invitation tournament at Madison Square Gardens, attended by near-capacity crowds at each session, was won by West Virginia. The West Virginians, seeded last, defeated Western Kentucky State, 47 to 45, in the final.

The Women's National A.A.U. championship was won by the Davenport, Ia., American Institute of Commerce. The business college girls defeated Little Rock, 42 to 25, in the final. Chicago's Division Street Clippers won their second straight international Y.M.C.A. championship.

Professional basketball brought league action to the east and middle west during 1942. The eastern circuit, known as the American league, was won by Wilmington, Del., while the National league title went to Oshkosh, Wis. Oshkosh, winner of the annual professional basketball tournament in Chicago, was defeated by a team of college all-stars, 61 to 55, in the exhibition which launched the 1942–43 season.

Service teams took an active part in 1942 basketball and were preparing for an even greater year in 1943. The Great Lakes

IN THE SEMIFINALS of the annual National Invitation College Basketball tournament at New York city in March 1942 Western Kentucky State Teachers' college defeated Creighton university, 49 to 36. In the finals, however, Western Kentucky State lost to West Virginia university, 47 to 45

naval training station unofficially was acclaimed the outstanding service basketball team of the year. (M. P. W.)

Batt, William Loren

(1887?–), U.S. government official and industrialist, was one of the key men in the War Production board during 1942. Born in Salem, Ind., he learned the machinist trade in his youth and graduated from Purdue university in 1907 with a degree in engineering. He rose rapidly in his field, helped in the research and installation of the first ball bearings ever used in locomotives, and became president of the S.K.F. Industries, a Swedish-owned ball-bearings firm. He was deputy commissioner of the National Defense Advisory committee raw materials division in 1940. In Jan. 1941 he became deputy director of the Office of Production Management's production division, later becoming director of the OPM materials division. When Donald M. Nelson organized the War Production board in Jan. 1942, he made Mr. Batt head of the agency's requirements committee as well as director of the materials division. Batt also was chairman of the joint U.S.-Canada materials co-ordinating committee, and was appointed by President Roosevelt to serve with Harry L. Hopkins and Adm. Emory S. Land as U.S. representatives on a joint U.S.-British board supervising a munitions, shipping and raw materials pool. Batt resigned from the WPB materials division in May 1942 to devote more time to his other posts.

Baudrillart, Henri Marie Alfred

(1859–1942), French cardinal, was born Jan. 6 in Paris, the son of Henri Baudrillart, economist. He entered the École Normale Superieure in Paris in 1878, taught afterwards at the University of Paris, and was ordained in the church in 1893. He was vicar general of Paris and rector of the Catholic institute and held the titular ranks of bishop and archbishop. In 1935, he was proclaimed cardinal priest. Cardinal Baudrillart was elected to the French academy in 1918 and twice received the academy award for his books. He was the author of numerous historical and religious publications, the best known of which was *Philippe V and the Court of France,* 5 vols. (1890–1900). After the occupation of Paris in June 1940, he was kept under surveillance by the German authorities. He died in Paris, May 18.

Bauxite.

World bauxite production was forced to expand rapidly, in order to meet the rising demand for aluminum. Most of the outputs reported in the accompanying table for 1940 and 1941 are estimates. Great Britain and Canada draw on British Guiana, while the United States supplements its domestic output by imports from Surinam; the axis powers control the outputs of Greece, Hungary, Italy, Yugoslavia and France.

World Production of Bauxite

(Metric tons)

	1929	1938	1939	1940	1941
Br. Guiana . .	220,119	382,400	483,700	550,000	900,000
France	666,348	682,400	680,000	700,000	500,000
Greece	. .	179,900	186,900	180,000	?
Hungary . . .	389,152	540,700	570,200	560,000	600,000
Italy	192,774	360,800	483,965	380,000	380.000
Neth. E. Indies	. .	245,400	230,700	274,375	100,000
Surinam . . .	219,603	377,200	511,600	615,434	1,100,000
U.S.S.R. . . .	. .	250,000?	250,000?	270,000?	?
United States .	371,648	315,900	381,300	445,958	900,000
Yugoslavia . .	103,366	396,400	318,800	260,000	400,000
World Total	2,185,000	3,850,000	4,370,000	4,500,000	5,500,000

Production in the United States in 1940 increased only 17% over the preceding year, but in 1941 the increase was 105%, with a total of 899,500 long tons, as compared with 438,913 tons in 1940. Even this increase was far from sufficient to meet the demand, and imports were increased in a similar proportion. The net total (imports less exports) rose from about 510,000 tons in 1940 to 590,000 tons in the first nine months of 1941. Demands for 1942 were much greater, as the consumption of metal was constantly increasing. Bauxite consumption in 1943 was expected to be of the order of 3,000,000 tons, against something like 1,700,000 tons in 1941. (G. A. Ro.)

Bayard, Thomas Francis

(1868–1942), U.S. senator, was born June 4 in Wilmington, Del. He was a member of the senate from 1922 to 1929, the fifth member of his family to sit in the upper house. He was a member of the senate committees on foreign relations, appropriations, territories and insular possessions and claims. He died in Wilmington, July 12. (See *Encyclopædia Britannica.*)

Beans, Dry. The 1942 crop of dry beans in the United States made another high record, 20,962,000 bags (100-lb. bags, uncleaned), as estimated by the department of agriculture Nov. 1. The previous record crop was 18,226,000 bags, in 1941. The yield per acre was 944.7 lb. in 1942. In 1941 it was 901 lb.

U.S. Production of Dry Beans in Leading States, 1942 and 1941
(in 100 lb. bags)

State	1942	1941	State	1942	1941
Michigan	6,406,000	6,163,000	New York	1,507,000	1,256,000
California	5,508,000	5,332,000	New Mexico	1,255,000	791,000
Idaho	2,102,000	1,914,000	Wyoming	1,092,000	649,000
Colorado	1,862,000	1,460,000	Montana	300,000	250,000

(S.O.R.)

HIGH SCHOOL BOYS were recruited to help harvest the U.S. bean crop of 1942

Beaux, Cecilia (1863–1942), U.S. portrait painter, was born in Philadelphia. Returning home from study at the Julien academy in Paris, Miss Beaux won immediate recognition in Philadelphia art circles and later exhibited at the salons in Paris. In 1919 she was commissioned by the U.S. government to paint official war portraits, and she was honoured by art academies and institutes throughout the United States. Her best-known works are "A New England Woman," Pennsylvania academy; "After the Meeting," Toledo Art museum; "Ernesta," Metropolitan museum, New York city; "The Dancing Lesson," Art institute, Chicago; "Sita and Sarita," Corcoran gallery, Washington, D.C.; "Portrait of Mrs. Dupont," Boston museum; "Girl with the Cat," Luxembourg museum, Paris; and a self-portrait at the Uffizi gallery in Florence. Her autobiography, *Background with Figures,* was published in 1931. She died at Gloucester, Mass., Sept. 17. (See *Encyclopædia Britannica.*)

Beaverbrook, William Maxwell Aitken, 1ST BARON (1879–), British publisher and statesman, was born May 25, the third son of a Scotch Presbyterian minister stationed at Newcastle, N.B., Canada. Educated in the public schools of Newcastle while he peddled newspapers, he entered business and formed a successful merger that earned him a fortune. He went to London, entered politics and was elected member of parliament in 1910. He was with the Canadian expeditionary force in France in 1915 and later was officer in charge of Canadian war records. In 1918 he was appointed chancellor of the duchy of Lancaster and minister of information. Meanwhile, in 1917, he had purchased control of the London *Daily Express,* a failing newspaper which by the 1930s he had converted into the largest daily in the world, with a circulation in excess of 2,500,000. Lord Beaverbrook, as he was known after 1917, also became publisher of the *Sunday Express* and the *Evening Standard.* On May 14, 1940, he was named by Winston Churchill minister of aircraft production, and on Aug. 2 he was admitted to the war cabinet.

On May 1, 1941, Churchill removed him from the ministry of aircraft and appointed him minister of state. In a further effort to speed up the production of British arms, Churchill appointed him minister of supply June 29, 1941. He represented Britain at the three-power (U.S.-British-Russian) conference which opened in Moscow Sept. 29, 1941, and in the following December, Beaverbrook accompanied Churchill to the United States. He was named to the newly-created ministry of production, Feb. 5, 1942, served 15 days, and then left for "reasons of health." Beaverbrook then took up the cudgel for aid to Russia and in several speeches appealed to the Allies to open a second front, which he declared would result in the quick downfall of Hitler. (*See* also *Encyclopædia Britannica.*)

Bechuanaland Protectorate: *see* BRITISH SOUTH AFRICAN PROTECTORATES.

Bee-keeping. The price received by U.S. producers of honey in Nov. 1942 was practically double that received in Nov. 1941. In the interval, national rationing of sugar had become effective, and a number of industries that formerly had not used honey at all, or only in inconsequential quantities, endeavoured to buy all available supplies as a substitute for sugar. Such industries included bakers, ice cream, soft drink and chocolate syrup manufacturers. In March and April 1942, the War Production board placed restrictions on the sale of honey and extracted honey. No restrictions were placed on comb honey. Honey production in the U.S. in 1942 was estimated by the department of agriculture in Sept. as 180,000,000 lbs.

WOMEN APICULTURISTS working at hives in 1942. Many women volunteered for work in U.S. apiaries during the year to replace male workers who had gone into the army or into war plants

Since 1930 the trend in honey production had tended downward, partly because of low prices, droughts and reduction in buckwheat bee pasture. In addition to broader use of honey in foods, the U.S. department of agriculture's *Marketing Activities,* vol. 5, no. 11, p. 14, recited that a California beauty parlor was reported as buying 60,000 lbs. of honey annually to use in facials.

Beer: *see* Brewing and Beer.

Belgian Colonial Empire.

The accompanying table gives material relative to the colonial and mandated territories administered by Belgium (*q.v.*). Total area 948,000 sq.mi.; total population (est. Dec. 31, 1939) 14,131,000.

History.—The loss of Allied possessions in the far east in 1942 considerably increased the economic importance of the Belgian Congo. The Belgian colony reached first rank for radium, and second rank for tin production. An agreement concluded between the British and Belgian governments placed at the disposal of Great Britain, in 1942, 144,000 tons of copper, its entire production of tin, 30,000 tons of ground-nuts, 90,000 tons of palm nuts, and all metals necessary for steel production. Congo exports to South Africa were also considerably increased—particularly timber.

After their co-operation in the Ethiopian campaign, the Belgian colonial forces were strengthened and reorganized. Hubert Pierlot, the Belgian prime minister, paid a visit to the colony during the summer of 1942 and Albert de Vleeschauwer, minister for colonies, spent several months in Africa and, in close co-operation with the governor general, took a series of measures in order to stimulate further the Congo's war effort.

(E. Ca.)

Belgian Congo: *see* Belgian Colonial Empire.

Belgium.

A kingdom of western Europe, bounded N. by the Netherlands and the North sea, S. and W. by France and E. by Germany and Luxembourg; occupied by Germany in May 1940. Area 11,775 sq.mi.; pop. (est. Dec. 31, 1939), 8,396,276; chief towns (pop. Dec. 31, 1938): Brussels and suburbs (cap. 912,774); Antwerp (273,317); Ghent (162,858); Liége (162,229). Ruler: King Leopold III; prime minister (1942): Hubert Pierlot; languages: French and Flemish; religion: Christian (mainly Roman Catholic).

History.—The year 1942 marked a further increase in the oppression and exploitation of occupied Belgium by the German invaders, and the corresponding resistance of the Belgian people.

Realizing that all attempts to induce King Leopold to depart from the attitude he adopted in May 1940, or to persuade the people to join the small band of "collaborationists" (Rexists or Flemish nationalists), the nazis dropped the mask and endeavoured to obtain by force what they had failed to obtain by persuasion. Their efforts to utilize Belgian industry met with little success, as shown by the notable decrease in production (except in the coal mines) and by the increasing number of unemployed workers who were compelled to leave the country (200,000 to 250,000, according to German statements). The failure to break opposition and pro-Allied activities through terrorism was still more remarkable, the number of crimes growing in proportion with the severity of the penalties inflicted. Capital executions could be estimated roughly at two or three per week.

Patriotic resistance was strengthened by the irreconcilable attitude of the church led by Cardinal Van Roey who, in several public pronouncements, condemned nazi doctrines and affirmed the duty of all Catholics to remain loyal to king and country.

This resistance was based on the hope of an early deliverance, because the Belgians realized that the prolongation of the war, without any alleviation to the blockade, would unavoidably bring about famine. During the last months of 1942 the food situation grew much worse, and several essential items on the ration list, such as potatoes, became unobtainable. The deficit in the population caused by starvation was estimated at 60,000 to 70,000 in 1941, the spread of tuberculosis being one of the main reasons for the rapid increase in the death-rate. It appeared evident that unless the war came to a speedy end or some means could be found to alleviate the hardships caused by the occupation and the blockade, the worst consequences of famine could not be avoided.

In London, the Belgian government pursued its various activities in conjunction with the Council of the United Nations, and in close co-operation with Great Britain and the United States.

Belgian Colonial Empire

Colony and Area sq. miles (approx.)	Population (000's omitted) (est. Dec. 31, 1939)	Capital, Status, Governors, Premiers, etc.	Principal Products 1939 (in metric tons)	Imports and Exports 1939 (in thousand francs)	Road, Rail 1939	Revenue and Expenditure (in thousand francs)

Progress was made in the organization of the air force and in the mechanization of the army. (E. CA.)

Education.—(1938) Primary schools 8,712; scholars 955,038; higher schools 273; scholars 86,279; universities (1937–38) 4; students 10,776.

Banking and Finance.—Revenue, ordinary (est. 1941) 12,159,600,000 francs; expenditure, ordinary (est. 1941) 12,003,000,000 francs; public debt (Dec. 31, 1939) 59,318,300,000 francs; notes in circulation (July 31, 1942) 58,537,000,000 francs; gold reserve (July 31, 1942) 21,677,000,000 francs; exchange rate (average 1940): belga = 16.88 U.S. cents.

Trade and Communication.—External trade (merchandise): imports (1939) 19,426,000,000 francs; exports (1939) 21,580,000,000 francs. Communication and transport: roads, suitable for motor traffic (1939) 6,571 mi.; railways, open to traffic, main (1939) 3,190 mi.; airways (1938), distance travelled 1,457,050 mi.; passenger mileage 8,255,980 mi.; baggage mileage 156,762 ton mi.; mail mileage 78,412 ton mi.; newspapers 52,504 ton mi. Shipping (July 1, 1939) 408,418 gross tons; tonnage launched (July 1938–June 1939) 27,600 gross tons; vessels entered, in net tons, (monthly average 1938) 2,497,000; (July 1939) 2,801,000; cleared (monthly average 1938) 2,502,000; (July 1939) 2,803,000; motor vehicles licensed (Dec. 31, 1938): 155,174 cars; 77,600 commercial; 67,016 cycles; wireless receiving set licenses (1938) 1,082,200; telephone subscribers, local (1938) 287,323.

Agriculture, Manufacturing, Mineral Production.—Production 1939 (in metric tons); wheat 349,000; oats 724,200; rye 349,400; potatoes 3,323,200; coal (1940) 25,605,000; pig iron and ferro-alloys 3,059,000; steel 3,104,000; beet sugar (1940) 231,000; barley 51,000; butter 61,000; margarine 60,700; artificial silk 5,900. Industry and labour: industrial production (1929 = 100) average (1939) 83.3; (Jan. 1940) 79.1; number wholly unemployed (average 1939) 195,211; (March 1940) 163,598. (*See* also BELGIAN COLONIAL EMPIRE.)

Benefactions: *see* DONATIONS AND BEQUESTS.

Bennett, Henry Gordon

(1887–), Australian army officer, was born April 15 in Balwyn, Victoria, Australia. He studied at Hawthorne college, Victoria, became a public accountant and businessman, and was president of the Association of Chambers of Manufacturers of Australia, 1933–34. He served in World War I, 1915–18, was decorated several times, and was a lieutenant colonel and brigade commander in the Australian imperial forces. He was in command of the 2nd division of the Australian army, 1926–31, and was promoted to major general in 1931. Gen. Bennett was in command of the Australian forces in the disastrous Malayan campaign in World War II and remained with his men until Gen. Percival, the British commander-in-chief, surrendered Singapore on Feb. 15, 1942. After Gen. Bennett completed the formalities of surrendering his own forces, he and a group of British imperial officers escaped from Singapore in a Chinese sampan and reached Batavia. The Australian war cabinet approved his conduct in the Malayan battles with a vote of confidence on March 2, 1942. Two days later Gen. Bennett frankly acknowledged that the British and Australians had underestimated the strength of the Jap army.

Bentonite.

The production of bentonite in the United States increased from 251,032 short tons in 1940 to 354,028 tons in 1941, of which 34% went into foundry and core sands, 33% in oil refining, and 17% in oil-well drilling. A new plant at Winnipeg was prepared to supply 200 tons monthly from the Morden district of Manitoba. (*See* also FULLER'S EARTH; MICA.) (G. A. RO.)

Bequests, Philanthropic: *see* DONATIONS AND BEQUESTS.

Berchtold von und zu Ungarschitz, Count Leopold

(1863–1942), Austro-Hungarian statesman, was born April 18, in Vienna. Count Berchtold, who was foreign minister for the Austro-Hungarian empire at the outbreak of World War I, was the author of the "fatal" ultimatum to Serbia that started the conflict in 1914. After the war, Count Berchtold retired from politics and lived in virtual seclusion. A Berne dispatch of Nov. 21 said he died on his estate in Sopron, Hungary, but the date of his death was not given. (See *Encyclopædia Britannica.*)

Berlin.

The residence of Hohenzollern electors, kings and emperors from 1442 to 1918, and capital of the German reich after 1871, Berlin is the largest and most important city of Germany. Reorganized in 1920 to include several suburbs, greater Berlin in 1939 had an area of 332 sq.mi., and a population of 4,332,000. Its favourable situation in north Germany on the River Spree, between the Elbe and the Oder rivers, affords it cheap water transportation through Germany's wide-reaching system of rivers and canals. It is also the centre of Germany's network of railways, motor highways and commercial air lines. Politically important as the seat of the Prussian and German governments, it grew rapidly after 1860 as an industrial and banking centre. In World War II it became the focal point of the vast nazi organization for the economic exploitation of Europe. British bombing during 1940–41 destroyed the interior of the opera house and many other buildings, but during 1942 the city was spared, except for a few bombs dropped by Russians. To lessen the danger from air attacks, important landmarks were camouflaged with a great network of foliage. (S. B. F.)

Bermuda.

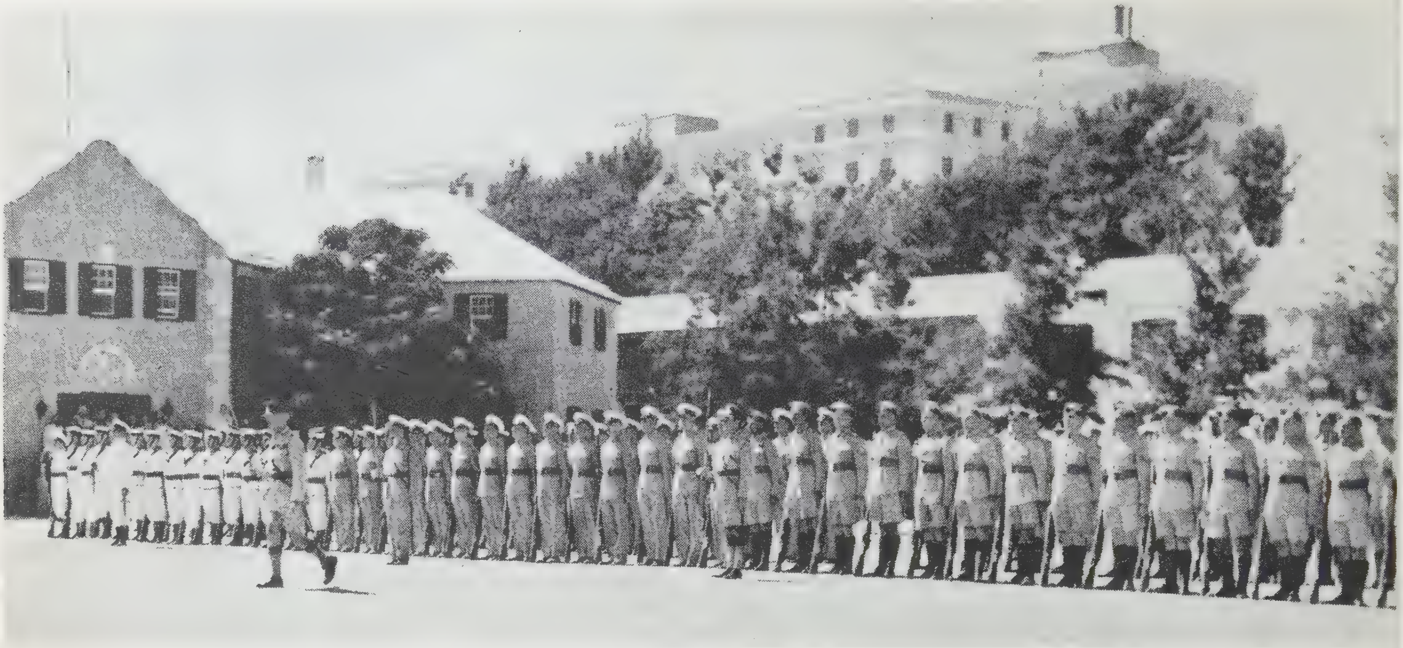
An island group and British colony 580 mi. east of Cape Hatteras, with an appointed governor and an elected representative assembly. Area, 19¼ sq.mi. The population by the Mar. 26, 1939, census (adjusted) was 31,481, and was officially estimated as of Dec. 31, 1941, at 32,451, not including members of the armed services of the United Nations, United States naval and army base personnel, and 772 Imperial Censorship employees. The capital is Hamilton (pop. 3,217). The governor in 1942 was Viscount Knollys.

History.—The effects of World War II continued to be felt strongly in Bermuda throughout 1942. Shipping shortage and, especially, the need of supplying military and naval personnel stationed in the islands necessitated some rationing of food. Despite poor crop conditions and the cessation of normal tourist trade, long the colony's economic backbone, Bermuda continued prosperous largely as a result of defense development in connection with the United States naval and air bases.

Education.—Bermuda in 1941 had 29 government schools with an average weekly attendance of 4,363. During 1942 the colonial assembly approved a long-range educational "blueprint" involving an increase in the school-leaving age from 13 to 14 years, manual training and a girls' domestic training system, agricultural education, and generally improved teaching standards and requirements.

Finance.—The monetary unit is the pound sterling (value in 1942, approx. $4.03½).

Trade and Resources.—In 1941 imports, comprising chiefly foodstuffs and manufactured goods, totalled £2,422,106 in value (1940: £1,469,504; 1939: £1,750,536), with the United States supplying 47.6% (1940: 40.8%), Canada 23.2% (1940: 24.2%), Great Britain 17.7% (1940: 22.7%). The heavy increases in value and volume were due largely to war conditions.



BRITISH SAILORS, marines and soldiers on the parade grounds of their barracks at Hamilton, Bermuda

Exports for 1941 were officially reported at £125,000 value (1940: £83,608) and included principally lily bulbs (£16,901 value), onions (£12,525), carrots (£7,423), and miscellaneous re-exports, notably empty containers (£24,788). The disparity between exports and imports is offset by tourist spending and by military and naval outlay in furtherance of the war effort. The tourist trade, normally involving 75,000 visitors annually, was almost nil in 1942, but losses were partially balanced by heavy transatlantic air travel, which promised to exceed the 1941 all-time record of 5,911 persons.

Communication.—Bermuda is a main station on the direct transatlantic air route to Europe. Private internal communication was entirely by boat and horse-drawn vehicle until 1942, when a legislative act granted permission for motor car use by doctors. Government automotive transportation had been permitted since the outbreak of World War II.

Bernacchi, Louis Charles (1876–1942), British scientist and explorer, was born in Tasmania and educated at Melbourne university (Observatory branch). He served as physicist on the Southern Cross Antarctic expedition, 1898, and the National Antarctic expedition under Capt. Robert F. Scott, 1901–04. He wrote *To the South Polar Regions* (1901), *Saga of the "Discovery"* (1938), and numerous articles on the scientific results of the Southern Cross expedition and on terrestrial magnetism, meteorology, seismology, gravity and atmospheric electricity. Bernacchi died in London, April 24.

Berry, Martha McChesney (1866–1942), U.S. educator, was born Oct. 7 near Rome, Ga. She was reared in the tradition of southern aristocracy, but renounced the "birthright" of a southern belle to bring "book larnin' " to poor mountain children in northern Georgia. She built a two-story log structure with a dormitory on her own land and thus in Jan. 1902, the Berry school made a humble start with five pupils and two teachers. Her school taught useful arts and crafts and required that all students earn their tuition by raising cattle, farming and performing other tasks. The school grew until, in 1942, it included four branches in outlying counties and 125 buildings stretching over 35,000 ac. Miss Berry's educational system became the pattern for programs in Georgia and neighbouring states. She died in Atlanta, Ga., Feb. 27.

Beryllium. As in 1940, there was a continued substantial advance in the demand for beryllium in 1941. In addition to the standard master alloy of copper with 4% beryllium, other alloys were attracting more attention, especially those with aluminum and nickel, and a ternary mixture made by the addition of cobalt to the standard copper alloy.

Imports of ore into the United States during the first nine months of 1941 reached 1,635 short tons—942 tons from Brazil and 693 tons from Argentina, against a total of 805 tons in 1940, of which 422 tons was from Argentina and 377 tons from Brazil. Due to demand in excess of supply, the War Production board on July 1, 1942, placed beryllium under complete allocation control.

(G. A. Ro.)

Besier, Rudolf (1878–1942), British dramatist, born July 2 in Java, was educated at Elizabeth college, Guernsey, and at Heidelberg. He wrote his first play, *The Virgin Goddess* in 1906. Two of his later dramas were written in collaboration with H. G. Wells and Hugh Walpole. His most successful play, *The Barretts of Wimpole Street,* was first produced at the Malvern festival, England, in 1930. The manuscript had been twice rejected in London and in the United States was turned down by 27 New York producers and players before it was accepted by Katharine Cornell. She toured the country, giving over 700 performances in the role of Elizabeth Barrett. Besier died at his home in Surrey, England, June 15.

Beveridge, Sir William Henry (1879–), British economist, was born

March 5 in Rangpur, Bengal. One of Britain's leading economists, Sir William served the government during World War I in the capacity of economics adviser on various ministerial boards. During the post-war era, he was director of the London School of Economics and Political Science, 1919–37, and was a member of the government committees on coal and food rationing. In 1940, he was appointed adviser on manpower and industrial capacity in the ministry of labour and a year later was made an undersecretary in the ministry. In June 1941, he was made chairman of the inter-departmental committee on social insurance and allied services with a view toward reform.

On Dec. 1, 1942, he submitted a 100,000-word document on his findings and recommendations to parliament. This document, called the "Beveridge Plan," outlined a new social security system which, if accepted by parliament, would change the face of post-war Britain. Its outstanding recommendations included: unemployment insurance for all, free medical and hospital treatment, child benefits, old age pensions, marriage and death grants. Some conservative elements in parliament were hostile to the plan as "too radical."

The Labour party generally hailed it as a broad step forward to socialization.

Beveridge Report: *see* SOCIAL SECURITY.

Bevin, Ernest (1884–), British labour leader and statesman. In his youth he was a truck driver in the vicinity of Bristol; later he became interested in trade unions and was elected general secretary of the Transport and General Workers' union. In 1937 he was appointed chairman of the General Council of Trades Union congress. On May 13, 1940 Churchill named him minister of labour and national service, and he was promoted to the war cabinet on Oct. 3. In these offices he showed great energy in helping to stiffen Britain's war effort by securing the collaboration of the working classes.

When the government set up three "executive" groups for production, imports and postwar policy Jan. 6, 1941, Bevin was assigned to head the production division. In July 1941 he announced the formation of joint labour-employer boards in war industries. In Nov. 1941 he warned that wartime shortages in Britain would require the drafting of 1,000,000 married women to work in munitions factories. Bevin retained his post during the cabinet shakeup of Feb. 22, 1942 and was given broader powers to mobilize all British manpower for war industries. On May 21, he declared that 22,000,000 out of 33,000,000 Britons between the ages of 14 and 64 had been mobilized in either the armed forces or in war industries.

Biddle, Francis (1886–), 58th attorney general of the U.S. and great-great-grandson of Edmund Randolph, the first U.S. attorney general, was born May 9 in Paris. A scion of the Philadelphia Biddles, he attended Groton and then Harvard, where he received his law degree *cum laude* in 1911. Biddle was admitted to the Pennsylvania bar in 1912. He stumped for Theodore Roosevelt in the 1912 and 1916 campaigns, and ran, unsuccessfully, for the senate in 1914. An ardent New Dealer, he was appointed chairman of the National Labor Relations board in 1934. He was judge of the third U.S. circuit court of appeals, 1939–40, and was called from that post to become acting attorney general in June 1941 and was appointed attorney general by Pres. Roosevelt on Aug. 25, 1941. A staunch defender of civil liberties, Biddle frequently warned against mob hysteria in fighting the fifth column, adding that aliens should be treated without "malice or race hatred."

In Oct. 1942, he announced that the 600,000 Italian citizens living in the United States would no longer be treated or regarded as enemy aliens.

Billiards. Once again Willie Hoppe, veteran New Yorker, 55 years old, led all the rest in billiards. Hoppe, who at one time or another has held every billiard title, easily carried off the three-cushion championship of the world for the third year in a row. A heavy favourite from the start, Hoppe met with no difficulty in the tournament held in Chicago.

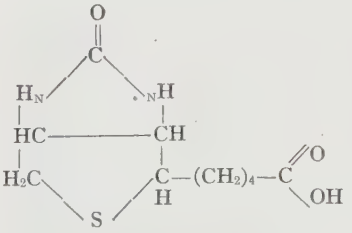
True, he was beaten once, but every other man in the big field suffered at least three setbacks and Hoppe, with a record of eight victories in nine matches, successfully defended his crown with ease. Welker Cochran of San Francisco, himself a former champion, was the runner-up, followed by Joe Chamaco of Sonora, Mex., and Ralph Greenleaf of New York, who tied for third place. Greenleaf's high finish was somewhat of a surprise, since his fame was achieved as a pocket billiard player and not at three-cushions.

However, in the six-man field at Detroit in December, at pockets, Greenleaf could finish no higher than fifth, virtually tied for last place with Erwin Rudolph of Chardon, O. The competition, in which every man was a former titleholder, was won by 29-year-old Willie Mosconi. The former Philadelphian won nine out of ten matches. Andrew Ponzi of Philadelphia was second.

Earlier in the year, Irving Crane, youthful star from Livonia, N.Y., triumphed over Rudolph in a challenge match. This event, contested at Rochester, N.Y., in May, saw Crane dethrone Rudolph, five-time champion, 900–744. Crane's reign, however, was short-lived. He wound up third in the Detroit tournament. (L. EF.)

Billington, Rose Ann (1859?–1942), U.S. suffragist, was born in Bootle, England, and went to the United States with her husband to make her home in Jersey City, N.J. In her crusade for women's suffrage, Mrs. Billington appealed to four presidents, McKinley, Taft, Theodore Roosevelt and Wilson, to give U.S. women the right to vote. During a suffragist demonstration before the White House, she gained an audience with President Wilson and was credited with having persuaded the president to urge senate approval of the 19th amendment—the suffrage amendment. After it became law, she was appointed to the Democratic national committee from New Jersey, the only woman from New Jersey to hold such a post. She died in Jersey City, Oct. 12.

Biochemistry. **Vitamins.**—The structural formula of biotin (vitamin H) was definitely established and its value for human nutrition was demonstrated. With the view of elucidating the chemical mechanisms by which vitamins act, numerous studies were reported on the chemical changes following vitamin deficiency or administration with tissue slices and extracts *in vitro*, purified enzymes, as well as intact animals. Diphosphothiamin was found to be a necessary factor in the action of a new cell-free decarboxylating enzyme from animal tissues, which converts pyruvic acid into acetoin $+CO_2$, and has similar actions on α-ketoglutaric and α-ketobutyric acids.

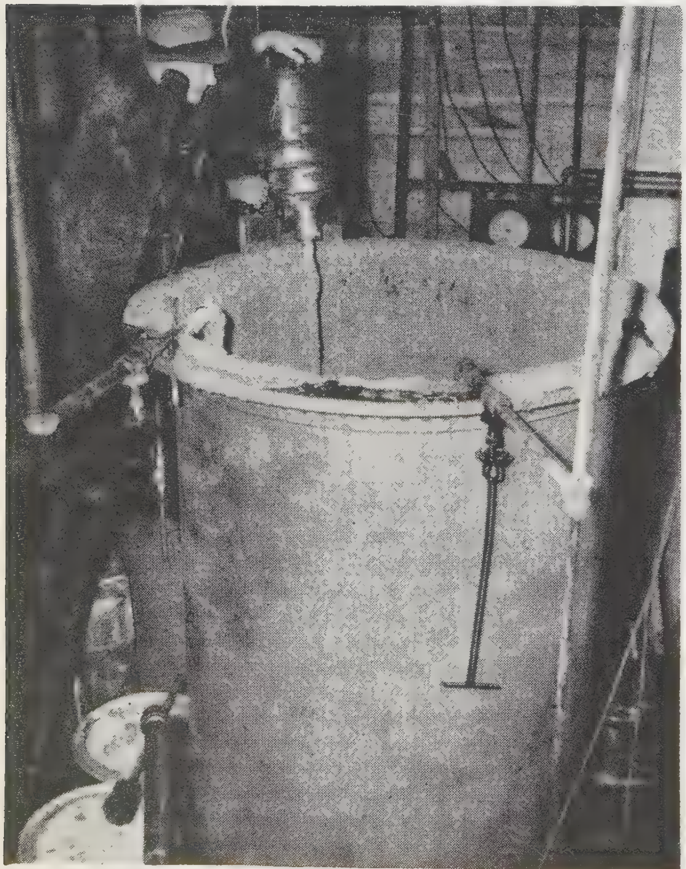


Biotin = $C_{10}H_{16}O_3N_2S$

Vitamin C was found to be necessary for the normal metabolism of tyrosine and phenylalanine. Deficient guinea-pigs, fed 1 g. tyrosine, show excretion of 50% to 100% of the amino acid in the urine as homogentisic acid and parahydroxyphenyl pyruvic acid, a condition not observed when adequate C is given. Similar observations were reported on infants fed cow's milk.

New and improved methods for chemical and microbiologic estimation of most vitamins were described, together with new data on the concentration of vitamins in foods and tissues and their formation by bacteria. Striking are the paradoxical facts that in certain vitamin deficiencies there is a normal or nearly normal concentration of the vitamin in the tissues. This is observed for nicotinic acid in the condition of blacktongue in dogs, for vitamin E in vitamin-E-deficient rats, and for choline in choline-deficient rats showing haemorrhagic kidneys. (*See* also Vitamins.)

Metabolism.—Studies with compounds containing stable and radioactive isotopes continued to provide new and fundamental information. That acetic acid is a precursor of cholesterol was shown by the finding of deutero-cholesterol in the tissue of rats and mice following the feeding of deutero-acetate, but not of deutero-propionate and -succinate. When acetic acid containing an excess of C^{13} is fed to rats, the urine contains acetone bodies with an excess of C^{13} showing a metabolic relation of these two substances. Experiments on the feeding of serine containing N^{15} showed that this amino acid is converted into ethanolamine and cystine, and is also incorporated into the body phosphatides. Experiments with radioactive phosphorus on the formation of phospholipid from inorganic phosphate by rat liver slices showed that this conversion depends upon (1) intactness of the liver cells—mincing or homogenizing prevents the action, and (2) aerobic conditions and energy-forming oxidations—the action is prevented by respiratory inhibitors, cyanide, azide, CO, as well as by absence of O_2. The feeding of methionine containing radioactive sulphur, S^{35}, causes the appearance of taurine containing S^{35} in the bile, and of cystine and methionine containing S^{35} in the proteins of tissues.



SHARK-LIVER OIL was found to contain the highest concentrate of vitamin A of any known substance and was therefore produced in large quantities in the United States during 1942 to replace oils from the livers of fish caught off Norway and Spain. The picture shows an agitator tank in which the crushed livers are mixed with water and chemicals, then heated and agitated to form a strong emulsion

Concerning the fixation of CO_2 by animal tissues, further studies on the utilization of CO_2 in the formation of α-ketoglutarate by pigeon liver, with heavy C^{13}, showed that the fixed CO_2 is found only in the carboxyl groups of organic acids, and in the case of α-ketoglutaric acid, only in the carboxyl group adjacent to the carbonyl group. Other studies with radioactive C^{11} led to the separation of a cell-free enzyme system which, when pyruvate is present, transfers $C^{11}O_2$ into the carboxyl group of this acid ion; and in the presence of both pyruvate and fumarate reaches its maximum rate of $C^{11}O_2$ fixation, while fumarate is converted into lactate and CO_2. Part of this enzyme system was identified as oxaloacetate-carboxylase, which converts oxaloacetate into pyruvate and CO_2. It is the reverse of this reaction (the enzyme catalyzes reversibly) which is thought to be the initial reaction of CO_2 fixation.

Crystalline Proteins.—Two biological activities were separated as crystalline proteins: carbonic anhydrase and the poliomyelitis virus. Electron-micrographs of five different proteins have been taken, and the molecular sizes estimated from these pictures agree well with those estimated by other methods. (*See* also Physiology.)

Birling.

At Gladstone, the roleo capital of the nation, on Michigan's upper peninsula, July 3, 4 and 5, 1942, top-flight birlers of the nation gathered to vie for the title of "king of the white waters." In the final match, before 15,000 spectators, James Running, 21, Beloit, Wis., and Walter Swanson, 24, Kodiak, Alaska, battled for 55 min. 21 sec. before a decision was reached. Running won the first fall in 48 min. 9 sec. and the second fall in 7 min. 12 sec. James Herron, Kelso, Wash., 1941 champion, did not defend his title because of his enlistment in the coast guard. The title of national girls' champion birler or "queen of the white waters" was retained by Mary Jean Malott, 22, of Cornell, Wis., who is a student at Anderson (Ind.) College and Theological seminary. She defeated Marietta Phipps Terrill, 21, of Stevens Point, Wis., in two straight falls. Marcus Olson, 14, of Marquette, Mich., won the national junior title by defeating Irving Deroeck, 14, of Gladstone, Mich. Ted Springer, Minneapolis, 1941 junior title holder, did not defend his title because of illness. The "old timers' round" for birlers over 50 years of ago was won by Jay Swanson, 51, of Brinnon, Wash., who defeated William Girard, Sr., 51, of Gladstone, Mich. The matches were refereed by Charles M. Sheridan, Washburn, Wis., nationally known authority on birling. (G. T. S.)

Birth Control.

The Birth Control Federation of America, Inc. by vote of its members at the annual meeting in Jan. 1942, changed its name to Planned Parenthood Federation of America, Inc., as more indicative of its aims and purposes. Work during the year was concentrated on: (1) inclusion of pregnancy spacing in more state health departments; (2) stimulation of adequate teaching of contraception in medical schools and wider distribution to physicians of a condensed authoritative text by Robert L. Dickinson on techniques of conception control; (3) raising funds for research and (4) continuing public education.

Claude C. Pierce, M.D., who retired as former director of Region 1 of the U.S. public health service, became medical director of the federation, John H. J. Upham, M.D., former president of the American Medical association, was elected chairman of the board, and Nicholson J. Eastman, M.D., head of the department of obstetrics and gynaecology, Johns Hopkins Medical school, became chairman of the National Medical Council on Birth Control.

(1) **Public Health.**—Three more states were assisted in initiating pregnancy spacing in their health departments, bringing the total to six.

Clinical Service.—On Dec. 1, 1942, there were 782 services in the United States; 216 in hospitals; 256 in public health quarters; 310 extra mural; and 336 of the total supported in whole or part by public funds.

(2) **Medical Education.**—Copies of a new edition of Dr. Dickinson's "Techniques of Conception Control" were sent, on request, to 45,000 physicians and medical schools. Returns on a questionnaire sent to 34,000 of those receiving the pamphlet, showed that the doctor's greatest interest was in techniques. A syllabus for teaching contraception in medical schools was drawn up, to be sent for their consideration to heads of these institutions.

Medical Endorsements.—The Florida State Medical association, the Tennessee State Medical society and the West Virginia State Medical association, all passed resolutions approving child-spacing, or planned parenthood, as part of public health activities and medical practice.

(3) **Research and Investigations.**—The Federation raised funds for research in various aspects of human fertility, to be conducted under the guidance of the National Committee on Maternal Health. These studies were long range projects; results would be announced at their termination. There was still urgent need for research in simpler effective contraceptive methods. Among the independent clinical studies on simple forms of contraception, were those of Irving R. Stein, *et al.* in Chicago, Beebe and Overton in Nashville, Beebe in a rural area in West Virginia, and Beebe and Geisler in a rural area of Kentucky. All of these studies showed a varying reduction in fertility among the cases advised.

The council on chemistry and pharmacy of the American Medical association appointed a committee on contraceptives to study drugs used in this field and to report on contraceptive preparations, and the medical subcommittee of the Family Planning association of Great Britain appointed a special Ad-Hoc committee to conduct a clinical investigation of the efficiency of certain chemical contraceptives.

(4) **Public Education.** *Negro Program.*—A two-year Negro child-spacing demonstration project was successfully carried out under the most difficult conditions to provide proof that under public health direction the benefits of planned parenthood could reach and would receive acceptance by even the poorest and most illiterate groups. Negro leaders in the fields of medicine, education and social welfare gave active support to a national educational campaign.

Legal Decisions, U.S.—The supreme court of errors, of Connecticut, by a vote of 3 to 2, on the Tileston case in June, ruled that the state law on contraception was constitutional and that under it no doctor could advise the use of contraceptives even in cases where the life of a patient was threatened by pregnancy. In November the U.S. supreme court agreed to accept the Tileston case for review.

In Massachusetts all efforts of the opposition to keep the question off the ballot having failed, the people voted in a referendum as to whether physicians in that state could legally advise patients on contraceptives, when life or health were threatened by pregnancy. The question lost.

Abroad.—In Great Britain birth control clinics remained open and an increase in the number of patients was reported. Conscription of women for war work led to a demand for contraceptive service by many who could not carry on in the country's war effort if they became pregnant. Medical officers of health were reported as co-operating in many countries by referring cases to clinics for advice. Elsewhere in Europe no information filtered through, beyond an authentic report from Germany that contraceptives were among the few articles still advertised for sale in a number of large cities. Germany, Italy and Japan were all pressing frantically for higher birth rates. This policy, accompanied by suppression of birth control information did not bring the desired results. (*See* also BIRTH STATISTICS; CIVIL LIBERTIES.)

Birth Statistics.

Provisional reports covering the first eight months of 1942 indicated that the number of births for that year in the United States, Canada and England and Wales would be appreciably greater than for 1941. Births reported in the United States through August of 1942 were 6.6% above those of the corresponding period of 1941. For 1941 as a whole, there were registered 2,511,550 births in the United States, the birth rate being 18.9 per 1,000 population, the highest since 1930. Canadian cities of 10,000 or more had an increase of 14.4% in births from 1941 to 1942, the period of comparison being through August of each year. Total births in Canada in 1941 numbered 254,483 and the birth rate was 22.3 per 1,000 population. In the great towns of England and Wales an increase of 17.5% in births was observed from the first eight months of 1941 to a like period of 1942. During 1941 as a whole, England and Wales had 587,228 births and a birth rate of 14.2 per 1,000 population, the lowest yet recorded in its history. The sharp recovery indicated for 1942 was a symptom of the hopeful attitude of its people in World War II. It was generally expected that the spurt in the birth rate just noted for the United States, Canada and England and Wales would prove to be temporary. As the war wore on, the withdrawal of millions of men for the armed services was expected to interfere seriously with normal family life and thus tend to depress the birth rate.

Birth rates per 1,000 population for 1941 reported for other nations were: Belgium 12.0; Bulgaria 21.3; Denmark 18.5; Eire 18.9; Germany 18.8; Hungary 18.4; Italy 20.9; Netherlands 20.3; Portugal 23.8; Sweden 15.6; European population of New Zealand 22.8; Japan 29.9; Argentina 23.9; Chile 32.6; Salvador 40.0; and Venezuela 36.8.

In a study of the relation between the course of employment and of the birth rate in Germany, it was found that, over short periods of time, the correspondence between the two was very close; the number of births increased following a period of rising employment, but decreased after a falling period. This relationship was found to be closer in cities than in rural areas. A conclusion drawn from the study was that the rise in the birth rate in Germany shortly before the war may be attributed to her improvement in employment conditions, rather than to the intense propaganda for larger families.

Within the United States, in 1941, the birth rates per 1,000 ranged from a low of 15.7 in New York to a high of 27.8 in New Mexico. Seven states had birth rates of less than 17 per 1,000, namely, Connecticut, Kansas, Massachusetts, Nebraska, New Jersey, New York and Rhode Island. On the other hand, eight states had birth rates of 23 or more; they were Arizona, Louisiana, Mississippi, New Mexico, North Carolina, South Carolina, Utah and West Virginia. It will be recognized that these states lie in the southern tier of the country and that all but Utah have large Negro or Mexican populations with high birth rates. The appended table shows the birth rate in each state in 1941.

Births per 1,000 Total Population in the United States, 1941

State	Rate per 1,000	State	Rate per 1,000
United States	18.9	Montana	20.4
Alabama	22.7	Nebraska	16.9
Arizona	24.1	Nevada	19.8
Arkansas	20.7	New Hampshire	17.8
California	18.1	New Jersey	15.8
Colorado	19.1	New Mexico	27.8
Connecticut	16.0	New York	15.7
Delaware	19.2	North Carolina	23.7
District of Columbia	24.7	North Dakota	21.0
Florida	19.8	Ohio	18.3
Georgia	21.8	Oklahoma	19.5
Idaho	22.3	Oregon	17.5
Illinois	17.0	Pennsylvania	17.6
Indiana	19.3	Rhode Island	16.2
Iowa	18.4	South Carolina	24.8
Kansas	16.7	South Dakota	18.0
Kentucky	22.3	Tennessee	20.8
Louisiana	23.1	Texas	21.2
Maine	18.7	Utah	25.0
Maryland	18.8	Vermont	18.8
Massachusetts	16.0	Virginia	21.9
Michigan	20.5	Washington	17.6
Minnesota	19.5	West Virginia	23.0
Mississippi	24.9	Wisconsin	18.2
Missouri	17.5	Wyoming	20.7

In 1940, the latest year of complete record, the birth rate per 1,000 was 17.5 for the white population, 21.7 for Negroes and 23.1 for other races.

Considered in regard to age of parents, the births per 1,000 population of all marital states were as follows for the white women of the United States in 1940: 42 at 15 to 19 years; 124 at ages 20 to 24; 117 at ages 25 to 29; 79 at ages 30 to 34; 42 at ages 35 to 39; and 14 at ages 40 to 44. Corresponding figures for the white males were: 6 at ages 15 to 19 years; 78 at ages 20 to 24; 125 at ages 25 to 29; 104 at ages 30 to 34; 69 at ages 35 to 39; 37 at ages 40 to 44; 17 at ages 45 to 49; 7 at ages 50 to 54; and 3 at ages 55 to 59. More than one-tenth of the white women bearing children in 1940 were under 20 years of age; one-quarter of them were under 23 and one-half of them were under 26, but only one-tenth were over 35. In the case of white men to whom a child was born during 1940, only one-tenth were under 23, one-quarter under 26, one-half under 30, and one-tenth over 41. The average age of fathers was 32 years, while that for mothers was 27½ years. The higher average age of fathers arises from their higher average age at marriage and the longer reproductive life for men than for women.

There is a pronounced variation in the birth rate in the United States with the season of the year. A recent analysis of data for the period 1937–39 shows, for the country as a whole, high points in February and March, followed in turn by a low point in May then the peak for the year in August, and the low for the year in December. The seasonal swing in the birth rates was most marked in the West South Central states and least marked in the Rocky Mountain and Pacific Coast states.

The need for proof of citizenship for positions in war industries brought forth a great number of requests for copies of birth certificates, when available. It was estimated that 54,000,000 native-born citizens did not have their births registered; of these about 43,000,000 were between the working ages of 20 and 65 years.

(*See* also CENSUS, 1940.)

Bismuth. World production of bismuth in 1941 was estimated at about 3,000,000 lb., of which the United States, Peru, Mexico and Canada supplied the major portion. The United States output was not reported, but was said to have reached a new high record. Imports in the first nine months of 1941 rose to 198,162 lb. of metal, while the bismuth content of lead bullion was probably about double that amount. The bismuth content of the 1941 Peruvian exports was 1,150,813 lb., 729,730 lb. in refined metal and 421,083 lb. in lead bullion, and the 1942 output was expected to increase. Bolivia exported 49,883 lb. of bismuth in concentrates in 1941. In Mexico the output dropped from 408,810 lb. in 1940 to 215,989 lb. in 1941. (*See* also METALLURGY.)

Black Market: *see* CRIME.

Blockade. The maritime blockade* of the continent of Europe inflicted severe hardships on nazi controlled territory as well as neutrals. In short, overseas trade ceased to exist for Germany. Blockade is not a spectacular method of warfare but one that, when effective, is felt by every man, woman and child in the blockaded territory. Blockade has through the years been the potent factor incident to superior sea power, and although blockade technique has been modified, the sum total of its effects remains, provided food and the sinews of war are denied the enemy.

Blockade in its generally accepted sense is the process or action by which a belligerent controls the ingress and egress of seaborne trade to another belligerent. Because of the use of air transport a new medium of cargo transportation must be considered in any estimate of the military-naval power and weapons necessary to maintain an effective blockade. The interruption, breaking up and stopping of sea communication has in its historic sense been a function of sea power. The control of bases, occupation of frontiers, and control of the air determine in the main the effectiveness of a land blockade. The most important and decisive blockades of history have been from the sea.

Neutral shipping has always suffered at the hands of superior sea power when strong navies exercise the rights of blockade. Considerable international law has been written on the subject of neutral trade with belligerents, much of which deals with such controversial subjects as "contraband," "ultimate destination," "ultimate consumption," or "substitution." The royal navy ex-

UNITED NATIONS CONVOY south of Jan Mayen Island en route to Murmansk, U.S.S.R., with lend-lease supplies in 1942. This convoy was later attacked by waves of German bombers based in northern Norway, and by submarines. Of the several supply lines to Russia, the Murmansk route was most effectively blockaded by the axis in 1942

ercised for years a strict control in war over neutral shipping by the close blockade of enemy ports and by men of war cruising over far-flung commerce lanes where the right of visit and search was exercised.

When blockade is efficient scarcely any trade flows to or from the blockaded country. An excellent example of the effect of blockade is that caused by the British on the American coast in 1813–14 when neutrals were barred as well as American vessels. In one year the exports in the Chesapeake fell from $6,994,000 to $268,000; that of New York from $8,185,000 to $209,000 while Philadelphia which totalled $3,577,000 in 1813 did not export one penny's worth in the following year. This was effected by a close blockade which made it practically impossible for ships to sail without detection; the majority that did sail were captured. The United States lacked a navy of sufficient strength to engage blockading vessels and destroy them.

The blockader generally promulgates to all nations the fact that a blockade exists, stating maritime or territorial bounds.

"It is agreed," writes the authority Hall,* "that for a maritime blockade to be duly set up and maintained:

1. The belligerent must intend to institute it as a distinct and substantial measure of war, and his intentions must have in some way been brought to the knowledge of the neutrals affected.
2. It must have been initiated under sufficient authority.
3. It must be maintained by sufficient and properly disposed force."

The technique of blockade changed considerably after the days of sail and short gun ranges. For in the wars of Great Britain against the French Revolutionary governments, Denmark, the United States, and the French Empire, vigilant watch was maintained within sight of the ports blockaded unless blockaders were driven off by weather.

In 1914–18, the royal navy maintained one of the most effective blockades in naval history by blocking ingress and egress by maritime route to Germany. Its drastic nature was such that the United States government protested the strict British Orders in Council as a violation of neutral rights. Germany finally went "all out" in submarine warfare in an endeavour to break the steel cordon of economic strangulation incident to the British blockade.

In 1942, the royal navy with some American units maintained a blockade and patrol that extended from Iceland to the Straits of Gibraltar as well as a naval force operating in the Mediterranean. Germany had submarine and plane bases located at convenient intervals from Norway to southern France in order to attack United Nations shipping and strike at the blockading vessels whenever possible. The blockading ships and planes frequently attacked axis coastal shipping and U-boats as they sought the high seas from Brest, Saint Nazaire, La Rochelle and other ports of nazi-controlled Europe.

Because of the advent of the mine, the torpedo, submarine, long-range shore batteries, and the aeroplane the modern blockade because of necessity became a "long range" one. The tactical or close blockade was seriously questioned as to its effectiveness after the Russo-Japanese War when Admiral Togo in front of Port Arthur lost two battleships by mines. The loss of one-third of the major Japanese capital ships caused Togo to relinquish his grip on the Russian port.

The British maintained a long-range blockade in 1914–18. In 1939, British naval units were stationed even farther at sea with battleships, cruisers and auxiliary cruisers operating often 500 miles or more at sea when on blockade and destroyers, submarines and corvettes operating in fairly close proximity to the coast of the enemy. All German Atlantic trade ceased but German blockade runners in a few cases were able to slip through the blockade and bring back some valuable cargo from Japanese controlled ports in the orient. A small number of axis raiders and blockade runners in 1942 were able to evade the blockade and reach hunting grounds in the south Atlantic. The Anglo-American occupation of Morocco, Algeria, and western Tunisia in Nov. 1942, severed important axis Mediterranean shipping.

At the outset of World War II, Germany inaugurated a *guerre de course* with submarines. In effect it was a counter blockade with the aim of cutting off the British Isles from food and war materials. After Italy joined Germany as an active axis partner all of Mussolini's submarines were utilized to attack British ships. The Italian navy came out second best in sea engagements with the British. Axis submarine warfare exacted a fearful toll of United Nations shipping and only the astounding record of shipbuilding on the part of the United States kept tonnage built ahead of tonnage sunk. German shore-based aircraft co-operated closely with submarines in harassing and attacking convoys of the United

---

Nations when in proximity of the continent of Europe. Axis planes proved a potent weapon in the counter blockade.

The blockader utilized the aeroplane not only for reconnaissance missions but also for bombing. The systematic and strategic bombing of axis bases on the continent was closely related to the Anglo-American blockade. The bomber takes up where the blockade in its more precise sense ceases and by destruction of enemy shipping, attacks on naval ports, and centres of industry, lessens considerably the war potential of the enemy.

At the outbreak of World War II, Great Britain disposed her sea power in order to exert maximum economic pressure on the enemy. A blockade was established that was defined as "an act of war carried out by warships of a belligerent detailed to prevent access to or departure from a defined port of the enemy's coast." It was soon found that the advent of airpower had greatly complicated the maintenance of a blockade. The nazis had a superiority in this new, fast, long-range weapon of war and thereby could give their submarines and raiders valuable information as to the location of enemy men-of-war and merchant ships. The luftwaffe until the late summer of 1942 was superior to the royal air force but with many nazi bases in Norway, Denmark, Holland and France, Germany was never able to gain control of even the eastern Atlantic, mainly because of the superiority of British sea power.

After the fall of France the disposition of the blockading ships of Britain was affected because of the possibility of a nazi invasion. Battleships were placed nearer the coasts of Europe in readiness to attack nazi battleships, some of which were using the fiords of Norway as bases. The royal navy faced at that time the most critical task in its long history.

It should be noted in any study of blockade that although the British fleet went to its blockade stations on Sept. 3, 1939, a formal blockade was never declared. Instead there was made a proclamation of lists of contraband that covered practically all imports to Germany. The British government on Sept. 9, 1939, stated that "to prevent contraband from reaching the enemy His Majesty's government will use their belligerent rights to the full." In the blockade that resulted complicated enforcement machinery was set up to carry out a "long range economic blockade."

A new practice of visit and search was devised because of the danger of stopping men-of-war long enough for inspection of the cargo of neutral ships on the high seas. Submarines and aeroplanes could make this practice a costly one. Suspected merchant ships were sent into control ports for inspection. In World War I the practice was commenced to the extent that in 1915, by the remote control methods of British blockade, about 5,000 neutral vessels underwent delay and search at the northern control stations while many others were subjected to this delay at the stations in the Mediterranean.

At the beginning of World War II merchant vessels were ordered in for examination at Downs near Dover and Kirkwall near Scapa Flow. In fact, a half million tons of cargo destined for Germany was seized by Britain before the end of 1939. This practice was changed after Dunkirk because concentrations for inspection were dangerous with axis air bases in Norway, Holland and France. Trade had nearly ceased to exist with the continent for there were few neutrals left. Any inspections in port had to be made further away from enemy shores.

Consequently a new technique was utilized that had been tried modestly in 1918; that was the issuance of certificates in the ports of loading. The Ministry of Economic Warfare ordered that cargo destined for neutral ports would be inspected by British consuls or officials before ships left the ports of loading and that navigation certificates or "navicerts" would be issued in order that blockading ships would know on challenge that permissible cargo was on board. This method also allowed a close check on aeroplane transport of articles of small bulk and great value. It was a simple and effective system—"navicerts" could be given or denied in ports that were far removed from the menace of enemy submarines and aircraft.

The submarine has been the most destructive of all commerce-raiding and counter-blockade weapons. Underwater craft are also most useful on blockade duty because of their ability to stay submerged during the day and surface to attack shipping and observe coastal activities at night. Until the early summer of 1942 the German U-boats were inflicting serious, in fact, considering tankers—critical damage to American coastwise shipping. But, because of increase in patrol craft, use of convoys, aeroplanes, and systematic search the menace was removed by mid-summer from the United States coastal zone. Shipping losses were still high on the Atlantic and, in particular, where ocean routes meet such as the most eastern tip of South America and the southern extremity of Africa.

Hitler continued the unrestricted U-boat campaign of Admiral Von Tirpitz in an attempt to break the economic bonds imposed on his country and to attack vital supply lines of the United Nations. At the end of 1914, Von Tirpitz was quoted as saying:

> "England wants to starve us! Blockade! We can play the same game. We can bottle her up and torpedo every English or Allied ship which nears any harbor in Great Britain, thereby cutting off large food supplies."

Although true of World War II, that underwater raiders exacted a costly and terrific toll of shipping with "large food supplies" destroyed by sinkings, the United Nations and British ships, in particular, kept the British Isles supplied with food, oil and the materials of war. Escorted convoys with "hunting destroyers" solved in the main the problem in World War I. The fight against the submarine in World War II, remained the major problem confronting sea power in the Atlantic theatre.

U.S. submarines deserved credit for the major share of Japanese merchant ship losses. As Japanese sea power was weakened by attrition and U.S. sea power gained by construction—more and more would a far-flung blockade be imposed on the Pacific area to cut Japan, an island empire, from the food and raw materials vital to her war potential.

At the close of the year the only sea on which German and Italian merchant ships could operate with some degree of safety was the Mediterranean. It appeared that United Nations land-based aircraft and British sea power in the North African zone would continue to take a heavy toll of enemy shipping, as evidenced by November and December records. It was by control of the seas that the United States under the Lend-Lease act could provide the eminently successful British eighth army in Africa with more than 1,000 aeroplanes, hundreds of tanks of which more than 500 were medium ones, 20,000 trucks and hundreds of pieces of artillery.

Storm-tossed surface blockaders and air patrols prevented nazi surface raiders from attacking this vital cargo of men and material bound to the middle east and Northern Africa. And though over 100 U-boats operated in the Atlantic at one time, superior sea and air power sank enough, and kept enough of the submarines from attacking to permit the supplies of the United Nations to be delivered at points of maximum effectiveness. oas, Franz (1858–1942), U.S. anthropologist, was born July 9 in Minden, Germany. One of the orld's leading authorities on the inheritance and environment of an, he was professor of anthropology at Columbia university or 37 years, retiring in 1936 to become an active crusader against azi racial theories. Having previously denounced the theory of Nordic superiority" as nonsense, Professor Boas maintained that ace is a matter of environment. He demolished the concept of pure race, demonstrated with historical evidence that European aces are a mixture of many stocks and declared that Germany ad one of the most mixed stocks in all Europe. Among his later orks were: *Race, Language and Culture* (1940). He died in ew York city, Dec. 21. (See *Encyclopædia Britannica.*)

ock, Fedor von (1880–), German army officer, was born Dec. 3 at Kuestrin, near Berlin, and as educated at the Potsdam Military school. At the age of 17 he as assigned to an infantry guards regiment. He had advanced to captaincy by the time of Germany's entry into World War I in 914 and emerged from the war a major. In 1920 he became ommander of the third army group, which post he retained for 8 years, until his appointment by Hitler as commander of the rst army group in 1938. During the invasion of France in May nd June 1940 he commanded the lower Somme army group. He as one of the 12 German generals created field marshals of the eich by Hitler on July 19, 1940.

In 1941 Hitler delegated to him command of the central German rmies in the Russian campaign. Bock dealt the Russians some of heir severest defeats in the early part of the campaign, notably t Bialystok and Minsk; also, later in the year, at Smolensk and yazma. He unleashed six separate major offensives against oscow in the fall of 1941, but failed to take the city. Then ock began his series of "orderly retreats" and "defensive ac- ions." He was later shifted to the southern front, and led the col- mns that bludgeoned their way to Stalingrad in the big German ummer offensive of 1942. He was unable to take the city, how- ver, and in October it was reported that he had been relieved f his command.

oggiani, Tommaso Pio (1863–1942), Italian cardinal, was born Jan. 19 at Bosco arengo, Italy. He joined the Dominican order when he was 15 ears old and was sent to Constantinople as a missionary after e was ordained. In 1912, he went to Mexico as papal nuncio, ith the rank of archbishop. On his return to Italy two years ater, he was made apostolic administrator of the Genoa arch- iocese. There he became involved in disputes over the adminis- ration of the archdiocese; and later he clashed with ecclesiastics ver theological questions in which he maintained a strong stand gainst modern influences in the church. In 1916 he was created ardinal bishop and in 1929 bishop of Porto and Santa Rufina. ardinal Boggiani died in Rome, Feb. 26.

Bohemia and Moravia. A protectorate of Germany in central Europe, formed in March 1939, after the dissolution and occupation of Czechoslovakia. Area, 19,058 sq.mi.; population, 7,000,000, almost completely Czech and Roman Catholic. President (1942): Dr. Emil Hácha. Capital: Praha (Prague). Chief cities: Praha (850,000), Brno (270,000), Moravská Ostrava (125,000), Plzeň (115,000).

History.—During 1942 the protectorate lost the remnants of its autonomy solemnly guaranteed by Germany in 1939, and was made more and more an integral part of Germany. The resentment of the population against enslavement by the Germans increased the movement of resistance which, in its turn, led to measures of repression of unprecedented savagery. On Jan. 15 the so-called cabinet was reorganized. The office of prime minister was abolished, as well as the ministry of social welfare, a field in which the Czechoslovak republic had developed model institutions. The minister of justice, Jaroslav Krejči, the former premier, became chairman of the cabinet; for the first time a German official, ignorant of the Czech language, Walter Bertsch, was appointed to the very important post of minister of economics and labour. Colonel Emanuel Moravec, a professional soldier and one of the few Czechs who had embraced national socialism wholeheartedly, was made minister of public instruction. The task of the new cabinet, appointed in agreement with the acting protector, police general Reinhard Heydrich (*q.v.*), was to create all conditions necessary for the victory of the reich. The former prime minister, General Alois Eliáš, who had been arrested in Sept. 1941 and sentenced to death after having been prime minister under the German occupation for 29 months, was finally executed in June 1942.

This execution was part of the reign of terror which swept the country after an attack May 27 on Heydrich. The chief of the "SS," K. H. Frank, became deputy protector ad interim, a state of siege was proclaimed and ruthless mass executions were carried out. The victims belonged to all walks of life, but most of them were former officers, political leaders, high officials and professional men who were feared as possible leaders of the Czech movement of national resistance. Even Rudolf Beran, a former collaborationist politician in opposition to the policy of President Beneš, was sentenced to ten years at hard labour.

The terror reached its full fury when Heydrich died of his wounds on June 4 after great pain. Yet for several weeks, in spite of hundreds of executions and unprecedented rewards offered for any clue for the detection of the patriots who had attacked the German gestapo chief, the perpetrators could not be found. On June 19 two men, Jan Kubíš and Josef Gabčík, were apprehended in the Russian Orthodox church in Praha and were killed in a fight with the police. It was alleged that these two, and some others, had been dropped as parachutists from British bombers on Dec. 29, 1941, and that the two had actually killed Heydrich.

The most outstanding single act of terror committed by the Germans was the destruction of the small village of Lidice, near the mining centre of Kladno. Because the Germans suspected some inhabitants of having supported the patriots who killed Heydrich all the male inhabitants of the village, numbering more than 200, were shot, irrespective of age. The same fate was meted out to 56 women, while the rest of the women were put into concentration camps and the children were carried off to correction schools. As the Germans proudly announced, "all buildings of the village were levelled to the ground and the name of the village was immediately abolished." As a protest on July 12 a new housing project near Joliet, Ill., U.S.A., was named Lidice. On June 25 another Czech village, Ležáky, a small hamlet near Chrudim in eastern Bohemia, shared the fate of Lidice. This time not only all men, but also all women were slain by the gestapo.

In Bohemia special tribunals were set up to deal with political crimes committed against the Czech nation. The death penalty was decreed for farmers failing to report their entire crop, while confiscation of property was threatened as penalty for minor offenses. The penal code of the protectorate was adapted to the German penal code.

The terror continued in Bohemia and Moravia during the rest of 1942. Among the persons executed were also Bishop Matěj Pavlík Gorasd of the Orthodox Church and three of its priests; the church was disbanded and its property confiscated. The only legal party organization of the Czechs which had been tolerated under the German occupation and which had been organized on a totalitarian basis, the Národní souručenství (the National Solidarity party), was liquidated because it appeared "incapable of ideological regeneration" in the spirit of national socialism. The Jews of the protectorate were first concentrated in the small town of Terezín (Theresienstadt), the inhabitants of which were moved to other towns. From this overcrowded ghetto the Jews were then deported to eastern Europe. In the Terezín fortress died also Dr. Ludwig Czech, former president of the German social democratic party in Czechoslovakia. Under the republic he had been from 1925 to 1928 vice-president of the parliament and later minister of social welfare and afterwards minister of public works and public health. (For activities of the government-in-exile *see* CZECHOSLOVAKIA. *See* also SLOVAKIA.)

(H. Ko.)

Bolivia, a South American inland republic; area, 419,470 sq.mi.; pop. (1941 est.): 3,457,000; chief cities (with est. pop.): La Paz, the seat of government (250,000); Oruro (45,000); Cochabamba (37,000); Potosí (35,000); Sucre, the nominal capital (32,000). Religion: predominantly Roman Catholic. President in 1942 Gen. Enrique Peñaranda.

History.—During 1942 Bolivia continued to benefit superficially from wartime demands for its mineral production; but rapidly mounting living costs brought extensive strikes and unrest. By Dec. 14, miners, demanding a 100% wage increase, had become so insistent that a nation-wide state of siege was decreed. The ensuing conflicts between the miners and government forces brought an announced death toll of 19 and the arrest of three alleged leaders of a plot to overthrow the government. Deliveries to the United States under the provisions of the 1940 agreements (by which the United States was to purchase 18,000 tons of tin annually for five years and 3,000 tons of tungsten for three years) were so threatened that a special United States commission was reported investigating the dispute.

Meanwhile, in July, the United States increased the prices of tin and tungsten and agreed to purchase a greater annual tonnage of the two. In August a Bolivian economic mission to Washington, D.C., returned to La Paz to announce the creation of the Bolivian Development corporation with a loan of $25,000,000 from the United States. These funds were to be devoted to the construction of four major highways, the establishment of a national sugar industry, the stimulation of petroleum production, the creation of a currency-stabilization fund and the financing of imports from the United States.

In November congress, irate over the shortcomings of the August agreement with the United States, forced the resignation of the cabinet. Shortly afterwards, the congressional body finally gave its approval, but only by the narrow margin of one vote, to the settlement reached early in 1942 with Standard Oil of New Jersey, by which Bolivia was to pay approximately $1,750,000 for the properties expropriated in 1937.

Education.—Bolivia had some 2,000 primary schools in 194 with more than 150,000 enrolment, and three universities. Th 1942 budget allotted 125,420,000 bolivianos, or 13.1% to ed cation.

Defense.—The standing army was estimated in 1941 to numb 14,000, with a reserve of 75,000, and an air force of 60 plane Lend-lease grants from the United States were reportedly f $8,000,000 in 1942. A four year military mission from the Unite States was agreed to in August. Some 23% of the 1942 budg was for defense.

Finance.—The monetary unit is the boliviano (value in 194 approximately 2 cents U.S.). National revenues in 1942 we estimated as 1,104,518,300 bolivianos, expenditures 672,402,4 bolivianos. The foreign debt, approximately $53,600,000, was default in 1942.

Trade and Communication.—Tin accounts for some thre fourths of all export values (78% in 1941). Under the intern tional quota, an annual export of 46,778 tons was allotted. Actu export in 1941 was 42,884 tons, with an increase in prospect f 1942 as a result of the rise in prices after July. Tungsten (2,87 tons in 1941), antimony (16,359 tons), silver (228,576 kg.), zi (6,673 tons, a drop from 12,197 tons in 1940), copper (8,0 tons), lead (17,219 tons), gold (254 kg.) and other minerals a counted for practically all the exports.

Foreign trade (officially reported in £ sterling) totalled as fo lows: Exports, 1941 (provisional figures): £15,424,114 (193 £8,888,777; 1940: £12,877,211); imports: £7,768,991 (193 £4,848,358). In 1941 60% of all exports went to the Unite States and 35.3% to Great Britain. Imports are chiefly man factured goods from the United States (41.6% of total impor in 1941) and foodstuffs and fuel from Argentina and Peru (r spectively 20.3% and 9.6% in 1941). Import values in 1942 we estimated as higher than those of 1941.

Mining is the dominant industry; agriculture and grazing a insufficient for domestic needs, as is manufacturing.

External communication is by rail to Chile, especially, and Peru and Argentina, and by Pan American Airways to all par of America. Approximately one-half of a 680-km. railway bei built by Brazil to connect Santa Cruz, centre of the Bolivian o fields, with Corumbá, Brazil, had been completed by the end o 1942, and in September Argentina began the construction of line to Santa Cruz. Railway mileage in 1941 was in excess o 2,229 km. The Bolivian highway system included about 900 m of the Inter-American highway and nearly 5,000 mi. of othe roads. An internal air line, Lloyd Aéreo Boliviano, former German-controlled, was used in 1942 to speed up Bolivian d liveries of rubber to the U.S. (*See* also MEXICO.) (C. N. G.)

Book-collecting. William Schwartzmann, working with staff which grew from four to 400 i seven centres of population, compiled, with the facilities of th Library of Congress, a bibliography of material relating to a raids and air-raid precautions in many languages based on th actual experiences of stricken localities, including Germany. Th German material was for the most part excessively difficult t come by. The initial bibliography, which had wide distributio was followed by a supplementary compilation which brought th subject reasonably up to date. Still another supplement was be ing assembled to contain much fresh material from inside Ge many. The three compilations were put at the disposal of civilia defense groups throughout the United States.

Ames W. Williams' virtually completed definitive bibliography of Stephen Crane, compiled in collaboration with Crane's earlier bibliographer, Vincent Starrett, was interrupted because of Mr. Williams' entry into the military service. It is interesting to note that steps were being taken by several institutional libraries to preserve copies of soldier and sailor publications issuing from army camps and posts and from naval stations all over the world.

The year saw the completion and publication of at least two important contributions to scholarly bibliography. The catalogue of one of America's superlative private libraries, that of Carl A. Pforzheimer of New York, appeared, and with its completion William A. Jackson, cataloguer of the collection, was offered and accepted the curatorship of the Houghton library at Harvard. The Houghton library itself, made possible by the generous assistance of Arthur Amory Houghton, Jr., was dedicated and opened during 1942.

An admirable bibliography of the imprints of Horace Walpole's Strawberry Hill Press, based largely on the superb collection of Wilmarth S. Lewis, and compiled by A. T. Hazen and J. P. Kirby, was issued under the sponsorship of the Yale University Press.

The Bibliographical society (England) observed, but did not celebrate, its semi-centennial. Organized as a result of the enthusiasm of Walter Arthur Copinger of Victoria university, Manchester, whose name will always be familiar to every student of incunabula, the society in its early days heard papers read by such authorities as E. Gordon Duff, F. S. Ellis, A. H. Huth, C. T. Jacobi, and William Morris. Its greatest contribution to bibliography was the *Short Title Catalogue of English Books 1475–1640* (1926). The Bibliographical Society of America, only twelve years younger than its London prototype, continued to record a healthy increase in membership despite the stress of the times.

Sales.—The indispensable *American Book Prices Current,* since its initiation as an annual publication in 1895 the standard authority on rare-book values as established in the auction room, this year appeared under the joint editorship of Edward Lazare and Colton Storm, the latter of whom became curator of maps in the William L. Clements Library of Americana at the University of Michigan. Prices in general offered no comparison with the boom period. Buyers in many instances showed an excusable hesitancy in acquiring literary property. Potential sellers, on the other hand, displayed a complementary reluctance to placing their goods on the market.

Important collections dispersed during 1942 included the third and final part of the library of William H. Woodin, President Franklin D. Roosevelt's first secretary of the treasury; the great angling library of Dean Sage, himself the author of one of the rarest and most sought-for of angling books, *The Ristigouche and Its Salmon Fishing* (Edinburgh, 1888); and the collection of literature relating to the stage owned, and long used, by Julia Marlowe Sothern. The auction room lost a picturesque and irreplaceable character in the death of Maximilian Harzof, who went to America an Austrian immigrant boy with little formal schooling and became one of the great authorities on bookselling and book-collecting of his generation.

A new high price was registered for John James Audubon's *Birds of America* (1827–38)—$15,600. A copy of the first collected (1640) edition of Shakespeare's *Poems* fetched $3,400. An interesting allocation of values is provided by the fact that Robert Louis Stevenson's chart of Treasure Island brought $3,200. A copy of Kipling's rigorously self-suppressed *The Smith Administration* (Allahabad, 1891) sold for $2,700. A copy of the so-called (by the author) "second" edition of Poe's *Poems* (New York, 1831) brought $2,400. (J. T. W.)

Boothe, Clare: *see* LUCE, CLARE BOOTHE.

Borates.

The production of borates in the United States in 1941 rose to 301,282 short tons, an increase of 24% over 1940. Imports ceased, and exports declined. Domestic consumption was thought to have reached a new high. There was a temporary shortage of supply due to a strike in one of the plants, but this was remedied on the settlement of the strike. (G. A. Ro.)

Bormann, Martin

(1900–), German politician, was born June 17 in Halberstadt, Germany. After World War I he joined the Free corps and participated in frequent raids along the Latvian frontier. Imprisoned for a political offense in 1923, he was released two years later and joined the budding nazi party. In 1926 he became head of the nazi press in Thuringia and rose steadily in the favour of the party leaders. By 1933 he had become chief of staff to Rudolf Hess, then deputy fuehrer, and was a member of the reichstag. On Feb. 16, 1942 Bormann was appointed successor to Hess, who had flown to Scotland nine months before, and was given powers even exceeding those of his former chief. Long a fierce opponent of Christianity, Bormann had written a book thundering against clerical interference in affairs of the state and declaring that Christianity and naziism were "irreconcilable concepts."

Borneo: *see* BRITISH EMPIRE; DUTCH EAST INDIES; NETHERLANDS COLONIAL EMPIRE.

Borno, Louis

(1865–1942), Haitian politician, was born Sept. 20 in Port-au-Prince. He was a judge in the Haiti court of cassation and also held the portfolios of foreign relations, worship, public instruction, labour and finance in the Haitian government. He induced the government to agree to a treaty with the United States in 1916 which led to American occupation, thereby ending the constant terror and revolution that had wracked the island nation. Borno was elected president of Haiti in 1922, but his tenure was far from peaceful. The Haitians resented foreign rule, and protests against his autocratic administration swept the country. In 1930, following the Hoover Investigating committee's recommendation for gradual withdrawal of U.S. marines from Haiti, Borno agreed to popular elections and stepped down from the presidency in favour of an interim president. He died at Port-au-Prince, July 29.

Bosch, Robert

(1861–1942), German industrialist and manufacturer, was born Sept. 23 in Albeck, Germany. As a youth he worked with Thomas A. Edison in the United States and for the Siemens plant in Woolwich, England. In 1886, he opened his own workshop in Stuttgart, Germany, where he manufactured telephone appliances and later spark plugs. The Bosch magneto, Bosch lamp and Bosch auto horn brought him world fame and fortune. Branches of his company spread to many parts of the world, and he employed about 25,000 workers in Germany alone. He died in Stuttgart, March 12.

Bosen, James Cruze: *see* CRUZE, JAMES.

Boston.

Ninth largest city of the United States, with a population of 770,816 by the federal census of 1940. Boston is a seaport at the head of Massachusetts bay and is the capital of the state of Massachusetts. Area, 43.9 sq.mi., com-

TAXICABS gave way to horse-drawn carriages with top-hatted drivers in Boston after gasoline rationing went into effect along the U.S. eastern seaboard in the spring of 1942

prising most of Suffolk county. Mayor (Jan. 1, 1943): Maurice J. Tobin.

The tax rate for 1942 was $41.00 on an assessed valuation of $1,473,781,000, and the net bonded debt was $158,223,000. City employees received allotments of $1,476,605 to compensate for rising costs of living. Public school enrolment totalled 108,500.

The normal life of the city was greatly modified by the war in 1942. Wartime transportation difficulties were aggravated by the complete elimination of coastwise and intercoastal steamship service, including the tanker fleet upon which New England was dependent for petroleum products, and the gradual disappearance of the collier fleet.

Staggering of hours enabled the elevated system to cope with local passenger traffic in spite of the increasing restrictions on automobile use, but the shortage of fuel became increasingly serious. Thousands of families depended upon kerosene stoves for cooking and heating, and a period of unusually severe cold in December was accompanied by a serious shortage of kerosene.

The famous Boston common became the centre of U.S.O. activities. Many hotels and office buildings were taken over by the army, navy and coast guard. There were frequent blackout tests, and many thousands of citizens were serving in the well organized civilian defense system. Boston in 1942 was the centre of an increasingly important shipbuilding and ship repairing area.

Boston suffered from many fires in 1942. The fire in the Cocoanut Grove night club on Nov. 28 with its toll of about 500 dead and 182 injured was one of the worst disasters the U.S. had known. The city took prompt action to prevent any recurrence. All entertainment licences for hotels and night clubs were suspended until the safety of their premises was established. A series of investigations by state and city authorities culminated in the indictment of 10 persons, including several city officials, for criminal negligence.

Indices for Jan.–Nov. 1942 (average 1925–27 = 100) were as follows: Manufacturing employment 102.1, a gain of 11.4%; manufacturers' payrolls 141.3, a gain of 35.4%; department store sales 79.8, a gain of 7.7%. Jan.–Nov. 1942 bank clearings increased 13.1%, bank debits increased 9.6%, kilowatt hour sales of electricity increased 15.9%, landings by fishing vessels decreased 33.6% by weight and increased 15.1% by value, food prices increased 17%. (S. J. McK.)

Botanical Gardens: *see* BOTANY.

Botany. The organisms principally responsible for the synthesis of the organic matter in sea water (in area, about four-fifths of the earth's surface) are diatoms. The energy for this synthesis is derived from the absorption of light by certain pigments of these green algae. H. H. Strain and W. M. Manning (Carnegie Inst. of Washington, Stanford univ.) showed that the green pigment chlorofucine is a normal constituent of diatoms, and also of various species of brown algae, and that in some regions of the spectrum it absorbs considerably more radiation than chlorophyll *a*. It was demonstrated that chlorophyll *b* is not present in either of these groups of organisms.

The white clover mosaic, which causes the streak disease of the garden pea and which was previously thought to be due to a single virus, was shown by F. Johnson (Rockefeller Inst. for Medical Research, department of Animal and Plant Pathology) to be due to a combination of two viruses, pea-mottle virus and pea-wilt virus, a separation of these two being accomplished. When diseased white clover plants were connected to healthy broad-bean plants by means of strands of dodder stems, the pea-mottle virus but not the pea-wilt virus was transmitted to the bean plants through the dodder tissue. Then by inoculating cowpea plants with the mixed viruses it was found that only the pea-wilt onstituent became established, the cowpea being immune to the ea-mottle type.

The method of preserving wood against rotting organisms by mpregnating it with coal tar or creosote had been in use for nore than a century. Nevertheless, C. M. Christenson, F. H. Kaufert, H. Schmitz and J. L. Allison (Univ. of Minn.) found hat a fungus tentatively identified as *Hormodendrum resinae* is common and general inhabitant of wood (such as railroad ties nd telephone poles) impregnated with coal tar or creosote. This ungus was isolated from creosoted wood samples from eight videly separated states of the United States. The fungus not only olerates the coal tar and creosote but "is able to grow and reproduce with no other source of nourishment than occurs in these compounds." The strength of the wood is not injured by the ungus.

Albino maize seedlings fail to grow because food synthesis cannot take place in the leaves in the absence of chlorophyll. The equirement for organic material for growth cannot be met by dding sugar to the culture solution because absorption of sugar hrough the roots is inadequate. H. A. Spoehr (Carnegie Inst. of Washington, Stanford univ.) overcame this difficulty by introducing the organic nutrient into the plant through its leaves. The ip of the leaf was cut off and discarded; the cut surface of the emaining portion was immersed in a solution containing 0.3 molar ucrose. Such plants grown in sand containing mineral nutrients ncreased in dry weight, formed starch in the dark, and produced nflorescences, pistillate with silks, and staminate with pollen.

Leaves of persimmon were found by C. G. Vinson (Univ. of Mo.) and F. B. Cross (Okla. A. and M. college) to be unusually high in vitamin C, showing values varying among the five cultivated varieties and three wild forms from 20,300 to 32,800 mg. per kg. of fresh leaves. An acceptable tea was made from the eaves. Fruit tissue contained about one-tenth as much of the vitamins as did leaves.

The aberrant behavior of the pollen in the pear variety Beurré Bedford observed by P. T. Thomas (John Innes Horticultural nst., London, Eng.) forms the basis for producing improved ypes by an alteration of the number of chromosomes. Following nuclear division in the pollen mother cells the four nuclei use irregularly, so that some of the mature pollen grains have 4 x, some 3x + x, others 2 x + 2 x, 2x + x + x, or x + x + x + x chromosomes. In using this variety as the male parent in crosses with diploid and tetraploid varieties, progeny with chromosome numbers varying from 2 x to 5 x were obtained.

Tetraploidy similar to that induced with colchicine was produced (by T. M. Little, U.S. Dept. of Agric.) in snapdragon (*Antirrhinum majus*) by placing a drop of 0.2% sanguinarine hydrochloride on the growing tip of the plant.

Various species of the Saprolegniaceae show asexual characters of two or more genera of the family. S. B. Salvin (Harvard univ.) ttempted to determine whether such combinations of characters could have arisen in nature by sexual matings between individuals of two different genera. Out of 51 matings tested, one succeeded, hat between *Achlya flagellata* and *Thraustotheca clavata*. The resulting oospores had not been induced to germinate by the end of 1942.

British ecologists reported on the re-vegetation of bombed sites. M. Hartog examined the site of a three-storied corner house destroyed by a direct hit in Sept. 1940. By Aug. 1942 she found n flower within the bombed lot 22 species belonging to 10 natural orders, and in addition, thick patches of moss with fruiting capsules. One of the plants showing good capacity to invade and hold in such areas was *Buddleia*. In the sites of three houses bombed in the autumn of 1940, R. F. Shove in autumn 1942 counted 60 *Buddleia* plants, some of them 5 to 6 ft. tall.

Prune dwarf, a virus disease which reduces the yield of the prune type of plums to less than 10% of normal, was shown by Hildebrand (Cornell univ.) to be harboured in and to be transmissable from the tissues of the Damson plum tree, the disease at the same time showing no symptoms in the Damson and causing no reduction in yield of fruit.

In the experiments of J. C. Montermoso and A. R. Davis (Univ. of Calif.) rooted leaves and cuttings of *Coleus blumei*, after a pre-conditioning period of exposure to the normal conditions of light and darkness, showed a rhythmic fluctuation of the rate of water loss in darkness even under constant conditions of temperature and humidity. The loss was determined over four-hour intervals and the curve resembled that of a sine curve. When these same plants were given a reversed light exposure in the pre-conditioning period, *i.e.*, with electric lights turned on at 7:30 P.M. and off at 7:30 A.M., again a periodic loss of water occurred on transfer to darkness, but the diurnal maxima and minima in the curve were the reverse of those obtained with plants grown in the natural periods of light and darkness. It required about three and one-half days of exposure to the reversed light periods to bring about complete reversal of the maxima and minima of the curve, shorter periods producing only a partial shift. (*See* also HORTICULTURE.)

Botanical Gardens.—During 1942 the activities of botanical gardens and arboreta were considerably modified by war. Great emphasis was given to war gardens, economic plants and to drug and herb plants.

In the United States, Brooklyn Botanic garden continued its researches on canker-resistant chestnuts, comparisons of the floras of western South America and Galapagos islands, and the diseases of cultivated Iris. It published an illustrated guide to the trees (500 species, 130 genera and about 120 hybrids and varieties) of the garden, and an ecological guide to the local flora (500 species) of the garden. It also ran ten different activities that helped in the war effort: selling bonds, collecting books for canteens, furnishing plants including trees for army bases, and garden seeds for children of Greater New York. It also promoted in many ways the war garden movement in New York city.

At New York Botanical garden 12,000 accessioned species and varieties were in cultivation, also 3,000 species and varieties of ornamentals. A series of propagating houses were built and 30,000 types in the herbarium were isolated and placed in separate covers for easy reference.

At the Missouri Botanical garden the development of the arboretum 35 mi. southwest of St. Louis was continued with new roads and planting. A successful Victory Garden Harvest show was held in October. The Cornell arboretum under reduced appropriations, because of the war, continued its planting. It planted during the year more than 1,000 trees, mainly junipers and conifers. In the absence of Director Warren H. Corning, Captain in the Army Air Corps, B. P. Bole, Jr. directed the Holden arboretum at Cleveland, Ohio. The arboretum obtained during 1942 an outstanding collection of hybrid azaleas.

In spite of lack of available labour, Montreal Botanical garden, under the Directorship of Henry Teuscher, was well maintained during 1942. The garden had an exhibit of "Plants Useful to Man" at the Province Horticultural show. Close co-operation was developed between the garden and the city park system.

The Morton arboretum, at Lisle, Ill., completed Thornhill building. This building contained a large lecture room with seating capacity for 250 people, class rooms, laboratory, library and offices. This building was to be used entirely for educational work for which there would be no charge. The arboretum ran three demonstration victory gardens of various sizes during the summer of 1942.

Arnold arboretum, Boston, Mass., added 61 new varieties to its lilac collection, bringing the total number of species and varieties to 556. This was believed to include all species and varieties growing in the United States. A complete collection of ornamental crabs was also being attempted. Dr. Frans Verdoorn was employed as bibliographer to make an *Index Botanicorum*.

For the occasion of the Centenary celebration of the Royal Botanical garden, Kew, Eng., April 1, 1941, its Director, Sir Arthur W. Hill, wrote a brief history of the development of this garden. A rather full review of this historical sketch appeared in *Chronica Botanica* (vol. 6, pp. 414–417, 1940–1941). (*See* also HORTICULTURE.) (W. C.)

Boule, Pierre Marcelin

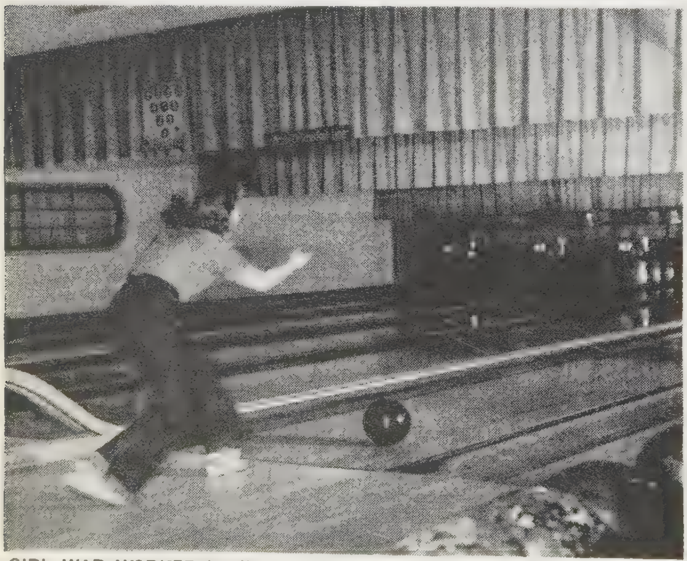
(1861–1942). French palaeontologist, born Jan. 1 at Montsalvy, was a recognized authority on the Neanderthal and other prehistoric men. He died in retirement at Montsalvy, July 19. (See *Encyclopædia Britannica* for his biography.)

Bowling.

John Stanley of Cleveland, rolling a near-record 756, won the American Bowling congress singles title. His total, second highest in the 42-yr. history of the A.B.C., included games of 258, 253 and 245. Stanley Moskal of Saginaw, Mich., won the all-events championship with a 1,973 total, including scores of 599 in team, 711 in doubles and 663 in singles. John Heinrich of Chicago had high single game of the A.B.C., a 299.

Ned Day of West Allis, Wis., relinquished his world championship crown, but the title did not leave Wisconsin. Connie Schwoegler, a 25-year-old 215-lb. bowler from Madison, Wis., won the 1942 national individual match game title with a 72-game average of 217.18. Schwoegler included a 299 in his championship total.

Nina Van Camp of Chicago set a new all-events record in the 25th annual Women's International Bowling congress, her 1,888 being 71 pins higher than the previous mark. Tillie Taylor of Newark, N.J., won the singles with 659, while Stella Hartrick and Clara Allen of Detroit won the doubles with 1,204.



GIRL WAR WORKER bowling. This sport was a favourite among workers in U.S. war plants during 1942

No letup in bowling's popularity was evinced in 1942. An estimated 15,000,000 fans took part in the sport in the United States. The recreational aspect of the sport for war workers was expected to increase its popularity and keep most of the country' 180,000 alleys in constant use. (M. P. W.)

Boxing.

Dim-out regulations curtailed outdoor boxing activities in affected areas. The New Jersey Athletic commission approved 1 A.M. starting time for bouts early in the year to accommodate war workers. The New York State Athletic commission co-operated to the fullest in ring events arranged for service funds or service members. Soldiers and sailors of allied nations were welcomed to boxing bouts on the guest-basis that obtained in theatricals and movies.

The two king-pins of fisticuffs, Sergeant Joe Louis, world heavyweight champion, and Corporal Billy Conn, most dangerous contender for the title, were paired for a contest on Oct. 12 1942, outdoors, which was to have been staged in the interests of the Army Emergency Relief fund. Sponsored by a committee of sports writers, advertised as a non-profit undertaking from which only the fund would profit, the project had advanced through its preliminary stages when complications forced its abandonment and on order from Secretary Stimson of the war department, Louis and Conn, already engaged in light training for the occasion, were ordered back to army duties.

Louis, heavyweight champion since 1937, made two defenses of his title, one as a civilian, the other as a soldier.

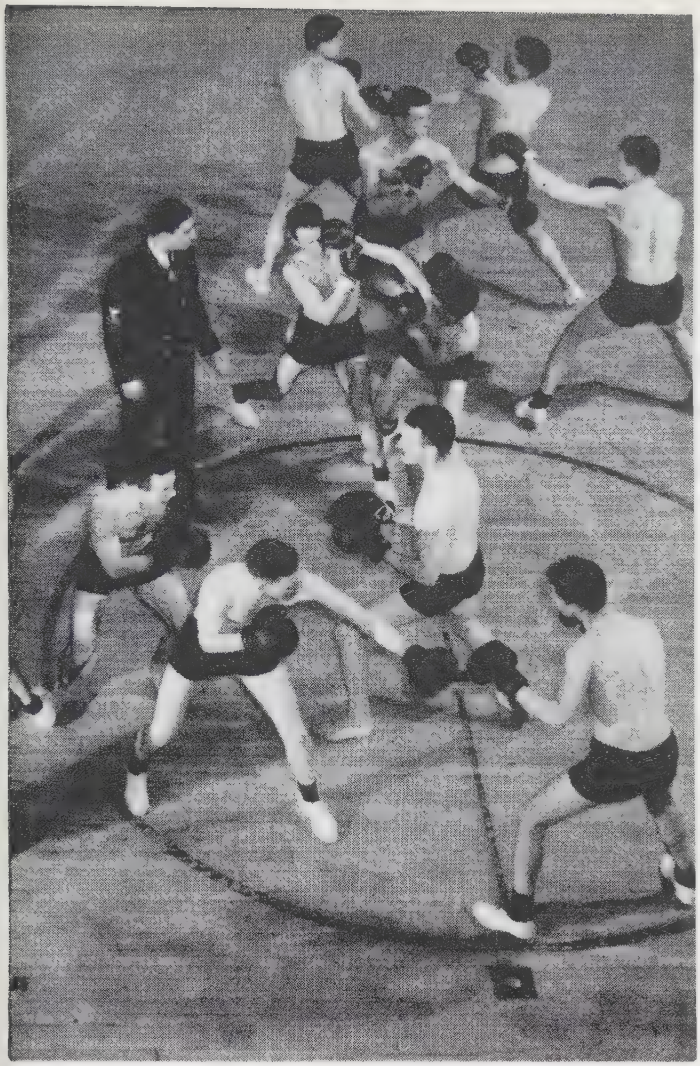
In slightly more than seven rounds of fighting, Louis polished off the two challengers. He knocked out the gigantic Buddy Baer at Madison Square Garden on Jan. 9, in 2 minutes 56 seconds of the first round of what was to have been a 15-round battle and the following day he was on his way into the army. He came out of military training March 27 long enough to knock out ponderous Abe Simon in 16 seconds of the sixth round of a scheduled 15-round bout in Madison Square Garden and, his furlough over, resumed his army life. There were 18,870 in attendance on the Baer battle which grossed $189,700. This was the year's biggest boxing gathering as well as the largest receipts. The Navy Relief society, for which the bout was staged, received $89,092, for, to Louis' winnings, $47,100, were added the profits of Promoter Mike Jacobs, part of Baer's purse, and contributions from preliminary fighters, ushers and attendants, and the Madison Square Garden corporation.

At the Simon battle of March 27 there were 18,220 persons present and the receipts amounted to $132,431. This match was staged for the Army Emergency Relief fund, which realized $64,980, the biggest contribution being Louis' entire purse amounting to $36,146. As was the case with the earlier Baer fight, Promoter Jacobs contributed his profits and the other contributions swelled the total.

Gus Lesnevich, Cliffside Park, N.J., world light-heavyweight champion, early enlisted in the coast guard and did not defend his title. The same was true of Tony Zale, Gary, Ind., world middleweight champion, who enlisted in the navy. Freddie (Red) Cochrane, Newark, N.J., world welterweight champion, was inactive because he enlisted in the navy in 1941.

Sammy Angott, Washington, Pa., made one defense of his world lightweight title and retired, undefeated. He retained the title against Allie Stolz, Newark, N.J. challenger, winning a 15-round decision May 15 in Madison Square Garden. Scheduled for a later defense of his title, Angott unexpectedly announced his retirement from boxing on Nov. 13, giving as his reason the claim that his hands were damaged irreparably and adding he intended to enter war defense work.

On Dec. 18 Beau Jack (Sidney Walker), Augusta, Ga., knocked



BOXING is a required sport at Great Lakes Naval Training station north of Chicago. The station produced a number of crack athletic teams in 1942

out Tippy Larkin, Garfield, N.J., in 1 minute 19 seconds of the third round in a scheduled 15-round bout in New York, and gained title recognition from the New York State Athletic commission. He had knocked out Stolz in six rounds on Nov. 13. The National Boxing association, however, declined to recognize Jack as champion, expressing a preference for a nation-wide elimination series.

Chalky Wright, Los Angeles, made two defenses of the world featherweight championship and lost the title on his third. He held the honour with a tenth-round knockout of Harry Jeffra in Baltimore, June 19 and remained featherweight champion Sept. 25, when he won a 15-round decision over Charley (Lulu) Costantino, New York. On Nov. 20, Wright was outpointed in 15 rounds by Willie Pep, Hartford, Conn., and his title passed. The division leadership, however, was in confusion because the National Boxing association, not in harmony with the New York State Athletic commission, recognized Jackie Wilson, Pittsburgh, as champion.

In the bantamweight ranks, too, confusion beclouded the championship. Manuel Ortiz, Mexico City, was recognized as champion on the strength of a twelve-round decision he won over Lou Salica, New York, recognized champion, in Hollywood, Calif., Aug. 7. However, because the bout was not at 15 rounds, the New York State Athletic commission declined to recognize Ortiz as champion, necessitating a re-match between the rivals. The flyweight class was dormant, as it has been for years.

Amateur and collegiate boxing felt the effects of the war, but championship tournaments were conducted. University of Maryland, expressly invited to fill out the entry lists, won the Eastern Intercollegiate association championships at Charlottesville, Va., March 7, although its 5-man team lost every bout in the finals. University of Wisconsin's 4-man team won the National Collegiate Athletic association championship title at Baton Rouge, La., March 28, winning four individual titles as well. In the Amateur Athletic Union's annual championships held in Boston, April 13, 14 and 15, titles were won by competitors from Cleveland, O., New Orleans, La., Fort Mitchel, N.Y., Lackawanna, N.Y., Saugus, Mass., St. Louis, Mo., and Pittsburgh, Pa.

(J. P. D.)

Boy Scouts. Among the outstanding war service projects requested by the U.S. government and performed by the Boy Scouts of America in 1942 were the collection, over a nine months period, of 300,000,000 lb. of paper; a scrap rubber campaign in which more than 30,000,000 lb. of rubber were collected; an all-out salvage campaign in which millions of pounds of steel were collected; the distribution of war bonds and stamps posters; the collection of more than 10,500,000 lb. of aluminum in 11,369 communities; and the planting of thousands of victory gardens.

The Boy Scouts of America were recognized officially as a part of the Office of Civilian Defense, and scout leaders were entitled to wear the insignia upon their scout uniform. By a joint agreement between the OCD and the Boy Scouts of America, three specific responsibilities were placed upon scouts (1) messenger service; (2) assisting emergency medical units; (3) fire watchers.

The new status of Junior Alumni was formed during 1942 for scouts who are obliged to drop their scouting activities but wish to maintain their relationship with the organization.

During 1942 the Air Scout program was adopted by the Boy Scouts of America and made available to all scouts 15 years of age as air scouts, and to scouts below 15 as air scout candidates. Four new merit badge pamphlets and an air scout manual were published.

Scout leaders and former scouts rushed to enlist in their country's service. In the first year of the war, out of 411 who received Distinguished Service awards from the United States government, 285 were former Scouts.

The 32nd Meeting of the National Council, a wartime meeting, was held in Minneapolis and St. Paul.

On Sept. 30, 1942, the grand total membership of the Boy Scouts of America, including scouts and scouters, cubs and cubbers, was 1,528,515 (including the latest figure received from Philippine Islands). Total troops and packs numbered 50,478.

Great Britain.—During 1942, scouts in England performed numerous acts of heroism. Since the beginning of the war many awards had been received by scouts and former scouts for gallant conduct, among which were one Victoria cross, more than 80 naval, military and air force decorations, presented to scouts, rovers and leaders serving in His Majesty's forces. In addition, awards of the Bronze cross, the Silver cross, the Gilt cross, 24 certificates of gallantry, 5 certificates of merit and three letters of commendation were made by the Boy Scouts association for gallantry during the war. Scouts in England were performing 180 different war service jobs, and more than 60,000 Scouts had qualified for the national service badge.

Four King's Scouts—Britain's equivalent of Eagle Scouts—toured the United States and Canada, recounting for American scouts and scouters their thrilling experiences under actual air bombardment and their service during Britain's trial by fire. Upon their return to England another tour was made in which they told of their experiences in America. (J. E. W.)

Bracken, John (1883–), Canadian political leader, was born at Ellisville, Ont., on June 22, and graduated from the Ontario Agricultural college, and the University of Illinois. After graduation Bracken went into the prairie provinces as a seed inspector for the Canadian government. He became professor of field husbandry at the University of Saskatchewan, and later president of the Agricultural college of Manitoba. It was while holding this post that in 1922 he was offered, and accepted, the leadership of the newly formed Agrarian or Progressive party in the province of Manitoba. He was returned to the legislature in a by-election held in Le Pas, the constituency he still represented in 1942. In 1932 he headed a coalition government of Progressives and Liberals, and later the coalition principle was extended to include Conservatives, Cooperative Commonwealth Federationists, and Social Credit members. In Dec. 1942 he emerged as a national figure, when he was chosen national leader of the Conservative party by a nominating convention meeting at Winnipeg. In deference to his views, the name of the party was altered to Progressive Conservative.

(J. I. C.)

Bragg, Sir William Henry (1862–1942), British scientist and Nobel prize winner, was born July 2 at Wigton, Cumberland, England. After the outbreak of World War II, he served as chairman of a scientific food committee. His last book, *The Universe of Light,* was published in 1933. Sir William died in London, March 12. (For his biography, see *Encyclopædia Britannica.*)

Bramah, Ernest (1868?–1942), British author, a resident of China for many years, was best known for his Kai Lung and Max Carrados detective fiction books. His first book was *English Farming* (1894). At the turn of the century, under the influence of the orient, he began his Kai Lung series which include *The Wallet of Kai Lung* (1900), *Kai Lung's Golden Hours* (1922), *Kai Lung Unrolls His Mat* (1928), *The Return of Kai Lung* (1937) and *Kai Lung Beneath the Mulberry Tree* (1940). His detective hero, Max Carrados, was a blind sleuth; his adventures are described in *Max Carrados* (1914), *The Eyes of Max Carrados* (1923) and *Max Carrados Mysteries* (1927). Bramah died in Somerset, England, June 26.

Brauchitsch, Walther von (1881–), German general, was born in Berlin on Oct. 4, the son of a general of cavalry, and was educated in the German capital. He entered a military academy and became a lieutenant in 1900. In 1912 he became an officer of the German general staff and he served in this position during World War I. In 1933 he succeeded Marshal von Blomberg as commander of the East Prussian army district, which in 1935 was transformed into the 1st army corps. In 1937 he became commander of the 4th army group, and in Feb. 1938, after the "army purge," he succeeded Gen. von Fritsch as commander in chief of the German army. He personally directed the campaigns in Poland, the Netherlands, Belgium and France. He was singled out for mention by Adolf Hitler on July 19, 1940, and, with 11 other generals, was raised to the rank of field marshal.

In 1941 Brauchitsch supervised German operations in the Balkans and Crete, in northern Africa and in the U.S.S.R. When his armies in Russia retreated, Hitler announced on Dec. 21, 1941, that he had removed Brauchitsch as commander in chief as of Dec. 19 and, answering an "inner call," had taken over that position himself. London dispatches of Dec. 10, 1942, reported that Brauchitsch had been summoned back to Berlin for consultations but was not reinstated.

Brazil A republic in eastern and central South America and the largest independent country in the western hemisphere; language: Portuguese; religion: overwhelmingly Roman Catholic; capital: Rio de Janeiro (pop. 1,781,567); president in 1942 (since 1931): Dr. Getúlio Vargas.

Area and Population.—Brazil has an area of 3,291,416 sq.mi. The population according to the 1940 census was 41,356,605, an increase of 10,721,000 in ten years, but was considerably less than the official estimate as of Dec. 31, 1939 (45,002,176). The main concentrations of population are in the south and in the east. Four southern states (São Paulo, 7,230,163; Paraná, 1,243,838; Rio Grande do Sul, 3,336,632; Santa Catharina, 1,182,854) had 31.4% of the population, but made up less than 10% of the area. The five eastern states of Rio de Janeiro (1,861,727), Sergipe (541,945), Bahia (3,907,086), Espirito Santo (758,425), Minas Geraes (6,797,219), and the federal district, *i.e.,* Rio de Janeiro city (1,781,567), with one-seventh of the total area, had 37.9% of the population. Seven northeastern states, occupying another seventh, had 24% (Maranhão, 1,246,813; Piauhy, 832,250; Ceará, 1,994,000; Rio Grande do Norte, 774,503; Parahyba, 1,424,457; Pernambuco, 2,674,683; Alagoas, 957,621). The Amazon valley states of Amazonas (449,077) and Pará (949,808) and Acre territory (81,326), with three-eighths of the total area, had 3.6% of the population; interior Goyaz (882,865) and Matto Grosso (427,629) states occupy almost a quarter of the area, but had only 2.2% of the population. Census reports for 1940 were lacking for individual cities; 1939 official estimates, however, showed the chief cities as: São Paulo, 1,322,643; Recife (Pernambuco), 550,389; São Salvador (Bahia), 388,183; Porto Alegre, 385,389; Belém (Pará), 318,341; Bello-Horizonte, 217,218; Santos, 203,126.

No official estimates of racial distribution were made, but according to the best unofficial calculations the population was 32.7% white (with 8.9% chiefly Italian stock and 2.6% chiefly German), 37.2% Negroes and mulattoes (full-blooded Negroes 5% to 12%), 17.7% Indians and mestizos (pure Indians 2.2%), and 0.7% orientals.

History.—World War II and its effects dominated Brazil's history politically and economically throughout 1942. In January

BRAZIL'S DECLARATION OF WAR Aug. 22, 1942, was "felt all over South America," as neatly illustrated by Bishop of the *St. Louis Star-Times*

Brazil was host to the Conference of Foreign Ministers of the American Republics at Rio de Janeiro (*see* HISPANIC AMERICA AND WORLD WAR II). Under the leadership of her foreign minister, Oswaldo Aranha, Brazil stood out as one of the most influential of all the countries represented at the conference. Foreign Minister Aranha himself played a prominent role in shaping the conference's program and policies. Evidencing its own sincerity and good faith, Brazil broke relations with the axis powers, with the avowed policy of giving all aid short of war to the United Nations.

With Natal, in Rio Grande do Norte state, a scant 1,620 mi. from Dakar (in 1942 under axis domination), northeastern Brazil was a logical point of entry for any axis-inspired invasion aimed at the western hemisphere. Fully cognizant of this, the government made strenuous efforts to improve the defenses of this area. In close co-operation with the United States in particular, air bases were developed, anti-aircraft defenses set up, and other air-raid precautions were taken.

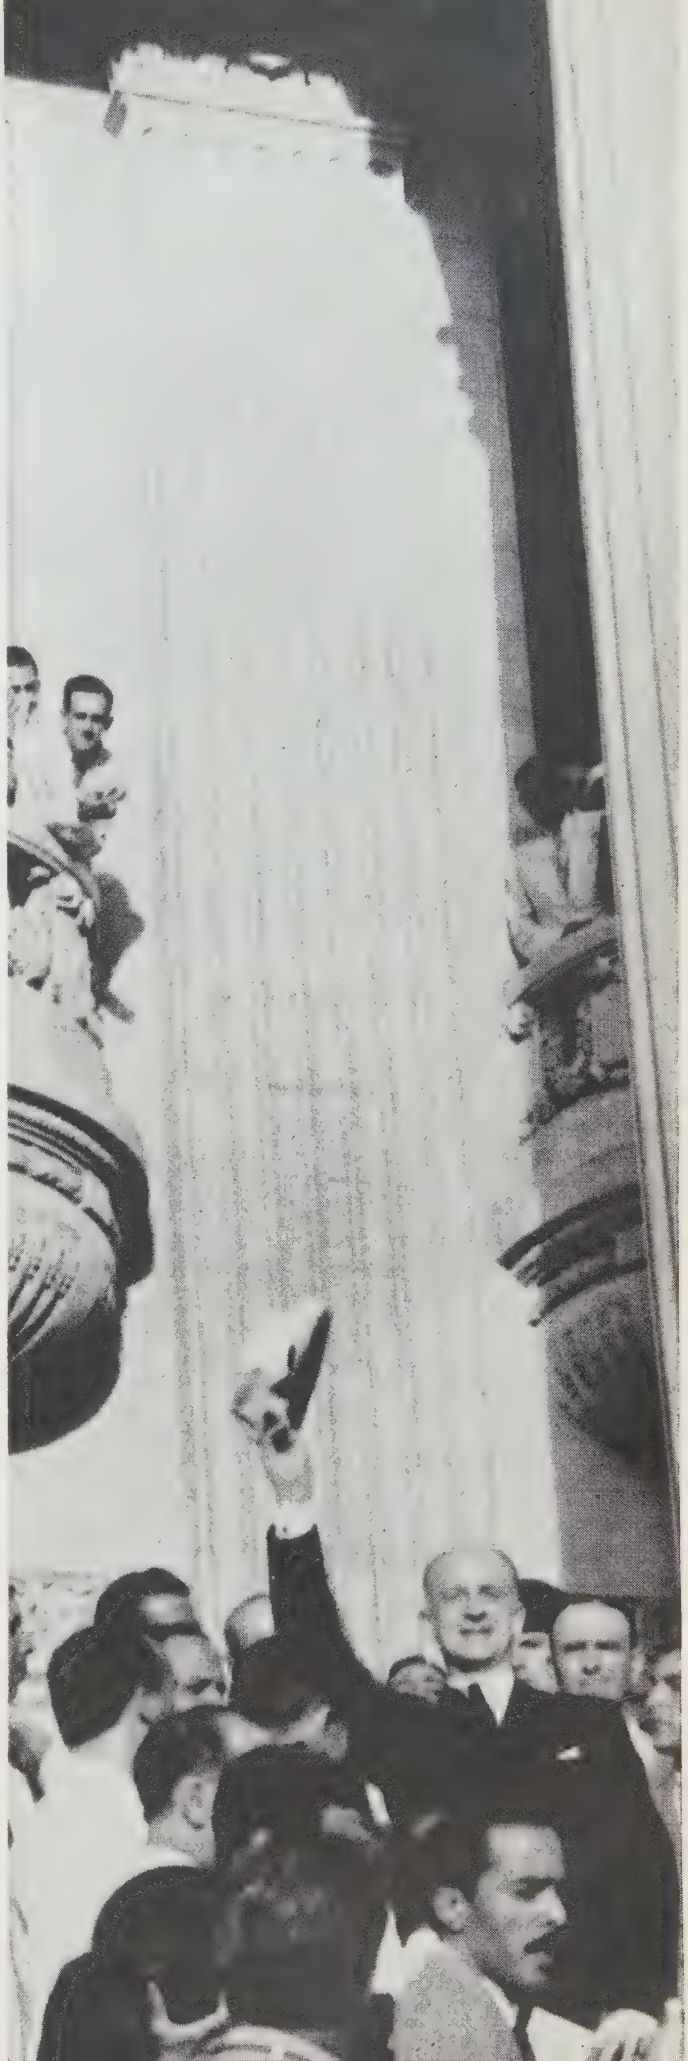
Meanwhile, as the axis submarine campaign in American waters increased in intensity, Brazil was drawn closer to actual participation. Several Brazilian ships were sunk, as well as a number under other flags engaged in carrying Brazilian commerce. Pres. Vargas promptly took strong countermeasures. A portion (from 1% to 30%, depending on the amount involved) of all axis-owned assets in the country was seized as compensation for Brazilian losses, and the Brazilian air force patrolling the coast was ordered to attack any axis submarines encountered. At the same time large minorities of axis origin in the country were carefully watched, and numerous persons of questionable loyalty rounded up.

The "aid short of war" period came to an end in August. Early in that month five Brazilian ships, including one load transport, were sunk by submarines off the Brazilian coast with heavy loss of life. These attempts to intimidate the country were soon answered on Aug. 22, by a formal declaration of war.

Immediately coastal patrol was stepped up, blackouts were instituted at strategic points, and enemy agents, including members of the pro-fascist Integralist party, were hunted down. Other measures effected complete confiscation of axis-owned properties, including banks with assets roughly estimated at $30,000,000 and a yearly turnover of around $200,000,000. Seventeen axis ships seized at an earlier date were formally confiscated, as were the properties of the Condor air lines, a subsidiary of the German Lufthansa. Plans were also made for evacuation of all Germans from the strategic "bulge" of Brazil.

The most immediate military significance of Brazil's entry into the war as a member of the United Nations lay in its effect upon the submarine campaign. Brazilian naval units, designed for defensive operations, were brought into active use, as were its air forces. Formerly, the nearest base from which to combat the submarine menace had been Paramaribo in Surinam, 1,800 mi. from the focal point of submarine activity off Brazil's easternmost tip. Now all Brazilian harbours and air bases were available. At the same time previous complications surrounding the use of Brazilian airfields for air transport from the U.S. mainland to West Africa were done away with.

The effect of Brazil's war declaration upon still nonbelligerent nations was likewise noteworthy. Every other South American country, including still-neutral Argentina and Chile, promptly granted nonbelligerent rights to Brazil, as they had earlier done for the United States. So, too, did Portugal, the Brazilian motherland, whose policies the other United Nations had at times found unsatisfactory.



SUMNER WELLES, U.S. undersecretary of state, acknowledging the cheers of Brazilians Jan. 15, 1942, the opening day of the Emergency Conference of American Foreign Ministers at Rio de Janeiro

ABAIXO OS TRAIDORES DO BRASIL

ON AUG. 22, 1942, when Brazil declared war on the axis, jubilant citizens staged an impromptu celebration in front of the U.S. embassy in Rio de Janeiro

Internally the declaration of war was followed by extensive mobilization measures. The government took over the operation of several domestic and foreign commercial organizations, among them the Lage organization, one of the country's largest commercial combines, involving shipping lines, shipbuilding, coal mining, construction, aeroplane manufacture, banking, real estate, insurance and other activities.

Measures controlling stocks and prices of a number of commodities were also adopted, and rationing was extended. Coal was one of the important products placed under price and distribution control. The decrees concerning controls provided for preference for government departments in merchandise sales, requisition of products needed by the government, and the preparation of national inventories of metallic, medicinal and drug stocks. Labour laws on working hours were relaxed to allow increased output in general industries and in those directly affecting national defense.

Education.—In 1940 there were 42,103 primary schools (enrolment: 3,463,000), besides numerous secondary, technical and other specialized schools, with more than 300,000 students.

Defense.—Military service is compulsory. As of 1941, Brazil had a standing army of 88,548 and reserves officially estimated at more than 250,000. The navy comprised 2 battleships, 2 cruisers, 16 destroyers (with 9 more under construction) and 4 submarines. The air force had 100 military planes and a personnel of 3,500. After Brazil's declaration of war in Aug. 1942, the armed forces underwent considerable expansion.

Finance.—Until 1942 the monetary unit was the milreis (valued at from 5 cents to 6 cents U.S.), theoretically split into 1,000 reis, and for large transactions ordinarily expressed in contos of 1,000 milreis each. Effective Nov. 1, 1942, the monetary unit was changed to the *cruzeiro,* equal to the old milreis, divided into 100 centavos.

In 1942, the budget presumed 4,388,756 contos of revenue, 6.4% more than in 1941, and 5,026,077 contos of expenditure 3% greater than in 1941. The budget for 1943 anticipated 4,777,673,000 cruzeiros in receipts and 5,270,160,879 cruzeiros expenditures. The largest single revenue source was the consumption tax replacing customs receipts, which had declined sharply since 1939 War expenditures were cared for by war bonds, whose purchase was obligatory for all 1942 income taxpayers.

Trade.—In 1941 export values (6,729,401 contos) exceede those of 1940 by 35.7% and 1939 by 19.8%. Import value totalled 5,514,417 contos, 11.1% over 1940 and 10.7% over 1939 For the first ten months of 1942, exports were tentatively reporte as 2,925,000,000 cruzeiros and imports 2,064,000,000 cruzeiros roughly half and two-fifths of the totals for the comparable 194 period.

The dominant feature of 1941 foreign trade was the increase role of western hemisphere trade. The United States took 56.9% of all exports (1940: 42.3%), Great Britain 12.2% (17.3%) Argentina 9.2% (7.2%), Japan 4.0% (5.8%), Canada 3.4% (2.1%), China 1.8% (3.1%), Uruguay 1.6% (1.5%), Chile 1.3% (0.7%), Germany 1.2% (2.3%), Colombia 1.1% (0.2%). Imports came from the United States, 60.4% (1940: 51.9%), Argentina 11.2% (10.8%), Great Britain 5.7% (9.4%), Curaçao 4.4% (4.7%), Canada 2.4% (1.9%), Japan 1.9% (2.4%), German 1.8% (1.9%), Portugal 1.8% (1.6%), Sweden 1.7% (1.4%) Switzerland 1.2% (0.7%).

Every major classification of imports and exports, except liv animals, showed considerable increases in 1941. Exports consiste of raw materials 48.3% (1940: 43.2%), foodstuffs 46.2% (1940 54.2%), manufactures 5.5% (1940: 2.6%), others, including liv animals, less than 0.1%; imports into manufactures 52.3% (1940 50.6%), raw materials 33.3% (1940: 33.7%), foodstuffs 13.6% (14.8%), live animals 0.8% (1940: 0.9%).

The leading exports in 1941 were coffee 29.9% (1940: 32.0%) raw cotton 15% (1940: 16.9%); preserved and refrigerated meat 6.7% (1940: 9.4%); cacao 4.7% (1940: 3.9%); hides and skin

4.5% (1940: 4.5%); carnauba wax 4.3% (1940: 3.4%); cotton cloth 3.1% (1940: 1.4%); vegetable oils (including cottonseed, oiticica, castor, copaiba, coco-nut and babassu oils) 2.9% (1940: 1.9%); castor oil seed 2.8% (1940: 2.4%); lumber 2.2% (1940: 1.7%); diamonds 2.2% (1940: 1.6%); quartz 1.5% (1940: 0.6%). Leading imports were: machinery and apparatus 18.8% (1940: 16.2%); wheat 8.8% (1940: 9.5%); automobiles and accessories 8.3% (1940: 8.1%); iron and steel goods 8.2% (1940: 8.9%); coal, coke, etc. 4.8% (1940: 5.8%); chemicals 4.1% (1940: 3.9%); gasoline 4.1% (1940: 4.0%); unrefined iron and steel 3.2% (1940: 1.9%); lubricating oils 1.8% (1940: 1.4%); unrefined copper 1.6% (1940: 1.0%).

An outstanding feature of 1941 foreign trade was the increased volume and value of mineral exports, whose export was restricted as of June 13, 1941 to the United States.

Communication.—External communication, normally good, was hampered by war conditions during 1942. Pan American Airways provided air transport service north and south, and its Brazilian subsidiary Panair do Brasil connected from Natal on the Brazilian "bulge" to Africa, linking there with routes to Portugal. The facilities of the former Condor (German) air line to the Rio de la Plata were in process of reorganization at the end of 1942.

Internal aviation in 1942 was under government control through the ministry of aviation. Domestic lines linked many isolated areas with the main centres of population.

Rail and highway communication was generally inadequate, with the Amazon basin entirely dependent upon navigable rivers. The highway system was about 140,000 mi. in extent but nearly all of it was unsurfaced in 1942. As of 1941, there were 21,750 mi. of railway in operation and some 600 mi. under construction.

During 1942, as a result of a visit to British Guiana by the governor of Amazonas state, long dormant proposals were revived for a railroad or highway from the interior of British Guiana to Bôa Vista, Brazil, in order to link that area with Manáus, the Amazon metropolis.

Agriculture.—Brazil is primarily agricultural, with coffee and cotton the principal money and export crops. Under the Inter-American Coffee Quota agreement of 1941, Brazil received originally a quota of 9,300,000 bags of 132 lb. for export to the United States, the principal consumer of coffee. A series of quota adjustments raised this amount to 13,772,990 bags (in July 1942) for the crop year ending Sept. 30, 1942. In the crop year 1941–42, first under the quota system, coffee prices averaged 50% more than in the previous year.

Unsatisfactory shipping conditions during 1942 threatened for a time to deprive Brazil of facilities for marketing its crops. Under an agreement with the United States in Oct. 1942, however, that country undertook to purchase a minimum of 9,300,000 bags of the 1942–43 crop, with payment made in advance of actual shipment. Included in this accord were similar provisions for purchase of 1,300,000 bags of cacao and 10,500 tons of Brazil nuts, at a total cost of $212,000,000.

In 1941 the cotton crop totalled 521,600 tons, of which 55% was exported, against 468,695 tons in 1940, with 48% exported. Exports in 1941 were 288,274 tons. A rapidly increasing amount of cotton was being manufactured for export.

Cacao is produced on a considerable scale in the tropical areas. Corn, rice, sugar, oranges, beans and manioc are important for domestic consumption. Forest products, mostly semi-cultivated, include yerba maté (Paraguay tea), carnauba wax (taken principally by the United States), castor seed, oiticica oil, a substitute for tung oil, and the babassu palm nut, whose oil was being developed in 1942 for use as a combustible.

It was estimated in 1942 that the Amazon basin had a potential of 60,000 to 70,000 tons of wild rubber annually, against actual production of 10,000 to 16,000 tons. During 1942, under stimulus of war demands, strenuous efforts were made to utilize Brazil's potential rubber production. Following a study of conditions and possibilities by technical experts from the United States, an agreement with the United States provided for a price of 39 cents per lb., and bonuses up to an additional 5 cents for production in excess of 10,000 tons, with the entire supply going to the United States Rubber Reserve company. The United States further undertook to aid transportation development in the primeval Amazon area and to provide extensive sanitation safeguards. The government of Brazil, on its part, took over the handling of all wild rubber collected, and made plans to recruit some 50,000 labourers and eventually double that number, drawing them largely from the northeastern states. Balata, close kin to rubber, used especially for machine belting and similar purposes, is likewise found in quantity.

In 1938 there were 41,883,374 cattle, 23,542,998 hogs, 14,167,450 sheep, 6,712,710 horses, 5,905,581 goats and 4,119,273 mules in Brazil. Frozen beef and hides and skins were exported in considerable quantities.

Manufacturing.—Manufacturing is primarily for domestic consumption, but exportation had been greatly accelerated since 1939. Manufactured exports in 1941 were 70% greater in volume and 184.3% in value than in 1940, largely the consequence of increased cotton textile and chemical and pharmaceutical manufactures.

Formerly, domestic iron and steel mills supplied around 144,000 tons of steel annually toward a normal demand of 405,000 tons, but the Volta Redonda steel mills, on which construction was begun in 1940, were expected to be in operation by 1944, with an initial output of 275,000 tons and eventually 750,000 tons.

Mineral Production.—In 1941 coal output was 1,407,530 tons (1940: 1,336,301 tons). Mineral exports in 1941 were more than double those of 1940 in value (487,803 contos; 1940: 221,813 contos) and only mica, aquamarine and chrome decreased in volume. In order of value, the 17 leading minerals exported in 1941 (with 1940 volume in parentheses) were: diamonds 64,309 grams (50,866 grams); quartz 1,980 tons (1,103 tons); iron (including all alloys except ferronickel) 476,190 tons (286,117 tons); manganese 437,402 tons (222,713 tons); mica 867 tons (1,117 tons); aquamarine 524,651 grams (1,169,034 grams); coal 61,434 tons (7 tons); titanium 2,369 tons (499 tons); carbonates 4,309 grams (2,304 grams); tantalum 91 tons (27 tons); zirconium 4,735 tons (1,521 tons); bauxite 14,365 tons (82 tons); ferronickel 441 tons (89 tons); beryl 1,703 tons (1,472 tons); tungsten 32 tons (10 tons); ilmenite 4,471 tons (12 tons); chrome 4,424 tons (4,572 tons). (*See* also ARGENTINA.)

Bread and Bakery Products.

An abundance of wheat in the U.S., and shortages in many other foods, increased the importance of bread and bakery products in wartime diets. Nutritional authorities advocated, in fact, that breadstuffs such as enriched white bread should comprise at least 40% of the calories in well-constructed American and British dietaries.

Continued progress was made in the enrichment of white bread with the vitamins of the B complex, thiamin and niacin, and the food-mineral iron. At the end of 1942 about 75% of all U.S. white bread was thus enriched with vitamins and minerals natural to whole wheat, in contrast to about 33% at the end of 1941. It is estimated that more than 12,000,000,000 lb. of white bread were produced in the U.S. in 1942, as against approximately 11,000,000,000 lb. in 1941.

Two states, South Carolina and Louisiana, adopted legislation in 1942 for the mandatory enrichment of all white flour and bread sold in those states. Federal standards for enriched flour sold in interstate commerce became effective on Jan. 1, 1942, but federal standards for enriched white bread were not promulgated. The standards followed for enriched bread continued to be those recommended by the National Research council.

Nutritional improvement of the popular U.S. white bread was accomplished, in general, by the voluntary action of American bakers, and was regarded as a noteworthy contribution to the war effort. A resolution for the vitamin and mineral enrichment of *all* white bread was unanimously adopted at a Baking Industry War Conference in Chicago in October 1942.

In Canada an Order in Council, effective April 1, 1942, established "Canada-Approved Bread," made from a specially prepared flour high in thiamin. In Great Britain the bread was the so-called national whole-meal loaf.

According to the latest official data, the American baking industry in 1942 consisted of about 18,000 establishments making bread and bakery products. These employed more than 200,000 wage earners, who were paid more than $262,000,000. Cost of materials was more than $568,000,000, and the total value of products amounted to nearly $1,500,000,000. (*See* FLOUR AND FLOUR MILLING.) (J. A. To.)

Brereton, Lewis Hyde (1890–), U.S. army officer, was born June 21 in Pittsburgh, Pa., was graduated from the naval academy at Annapolis, 1911. Two days after he was commissioned as an ensign he resigned to become a lieutenant in the army's coast artillery corps. He took flight training in 1912, served as a pilot in the Philippines and commanded one of the first U.S. flying units on the western front during World War I. A pioneer in the development of dive-bombing, he commanded in 1922 the first aviation attack group in the army air corps. He was in command of an airfield in the Canal Zone, 1931–35, and was transferred from his air command at the Tampa field in July 1941 to head the army air force in the Philippines. After fighting a losing battle against Japan's quantitative plane superiority, he was ordered to leave the Philippines and was made chief of the U.S. air forces in India. On one occasion in April 1942 he personally led a U.S. bomber raid on Japanese-held Port Blair in the Andaman islands. Transferred to the middle east in July 1942, he was put in command of the U.S. air force there and co-operated with the R.A.F. in planning joint attacks on axis military and supply bases in the Mediterranean zone.

Brett, George Howard (1886–), U.S. army officer, was born Feb. 7 in Cleveland, O. A graduate of Virginia Military institute in 1909, he was a major during World War I, retiring from active service in 1920. He later returned to the army, specialized in military aviation, and won his rating as a command pilot. In Oct. 1940, he was promoted to the rank of major general. After Japan attacked U.S. Pacific possessions, Gen. Brett, British General Wavell and Generalissimo Chiang Kai-shek set up a military council in Chungking for common prosecution of the war. On Jan. 3, 1942, when President Roosevelt and Prime Minister Churchill made Gen. Wavell supreme commander of Allied forces in the far east, Gen. Brett was appointed deputy supreme commander of that region and on Jan. 10 he was promoted to lieutenant general. On Nov. 4, 1942 Brett succeeded Gen. Frank M. Andrews as head of the Caribbean command.

Brewing and Beer. The generic word beer covers the malt beverage group, including beer, ale, porter, etc. Malt beverages are sold in all of the states of the U.S.A. under regulation and licence. They are taxed by the federal and state governments and in scattered cases local taxes are imposed. Aside from taxation, control is vested in the states which generally treat beer distinct from liquors because of its low alcoholic content.

In 1942, the product was manufactured in 39 states. Approximately 490 breweries were in operation at the close of the year as compared with 750 in 1935.

Sales Records.—Following are the sales records in United States barrels (31 gal.) by fiscal years, ending June 30: 1933 (85 days)—6,277,728; 1934—32,266,039; 1935—42,228,831; 1936—48,759,840; 1937—55,391,960; 1938—53,926,018; 1939—51,816,874; 1940—53,014,230; 1941—52,799,181; 1942 (official but not audited)—60,493,015.

Sales for the calendar year 1942 approximated 64,000,000 bbl While this was an increase of 12% over 1941, the rise was fair under the rate of increase in national income, which was about 20% over 1941. Brewing industry economists usually agree that beer sales, normally, follow the curves in national income.

Market Conditions.—Impaired facilities for distribution resulted in rationing by brewers in some instances. Tire rationing forced a cut in deliveries, and in many instances brought a return of the nearly forgotten brewery wagons and teams to share with trucks in delivery loads. Priorities on tin affected the bottling rooms. Cans, during 1942, became a total casualty as far as civilians were concerned, and were made available only to the armed forces. The shift to total packaging in bottles developed a heavier demand for crowns. In spite of this new load, brewers were allowed only 60% of the weight of crowns they used in 1941. Laboratory experiments with composition substitutes had developed no satisfactory solution by the close of 1942.

An adequate supply of ingredients was the most favourable factor for the industry. The brewers' raw materials are farm products that do not compete with the table and in recent years have been grown in surplus.

Package sales, considered significant of home consumption, continued to gain in 1942, accounting for about 58% of all beer sales In 1934 the percentage was 25% package against 75% draught Research conducted by the Psychological corporation of America revealed that 46% of all urban families are purchasers of beer or ale, an increase of 7% over a previous survey, taken a few months earlier.

Taxes.—The federal tax was increased $1 per bbl., effective Nov. 1, 1942, making the new rate $7 per bbl. Added to the state tax, averaging nearly $1.50 per bbl., the new tax rate borne by beer was over 8 times the tax load carried in 1914, when beer consumption hit its all-time peak.

Federal excise and special taxes on beer for the fiscal year 1942 ending June 30, totaled $369,659,765. Cumulative federal taxes after re-legalization, April 7, 1933, totalled $2,447,067,953. State and local taxes for the year ending June 30 were estimated at $960,000,000, bringing the combined public revenue from beer to approximately $3,407,000,000 for the period from April 7, 1933 to June 30, 1942.

Law Observance.—The industry's nationwide program being conducted through the Brewing Industry foundation, with committees of brewers and beer distributors applying it intensively in 15 states, worked directly with retailers and the public authorities to protect the good repute of beer and brewing from abuse by a minority of law violators.

In addition, an "army camp area" program covered all of the 37 states in which there were large concentrations of troops in training, including 13 of the 15 states referred to above. This program for camp and training areas, directed by the foundation, brought the co-operative effort of brewers, wholesalers, retailers and their associations to work with military and civil authorities for the maintenance of wholesome conditions where beer is sold. Light beer was sold on military reservations.

The general results of such sales at or near army training camps were found satisfactory by army and civil authorities, as well as private investigators, including many church representatives. As a result, many of them lent their support to a crystallization of sentiment opposing a threatened return of wartime prohibition. (*See* also LIQUOR CONTROL; LIQUORS, ALCOHOLIC.)

(H. HY.)

Bridge, Contract: *see* CONTRACT BRIDGE.

Bridges.

The world's longest spans of the various types in 1942 are listed in Table I.

Table I.—*World's Longest Spans*

Type	Bridge	Location	Year	Span
Cable Suspension .	Golden Gate	San Francisco	1937	4,200 ft.
Eyebar Suspension	Florianopolis	Brazil	1926	1,114
Cantilever	Quebec	Canada	1917	1,800
Steel Arch	Kill van Kull	New York	1931	1,652
Continuous Truss .	Duisburg	Germany	1935	839
Wichert Truss . .	Homestead	Pittsburgh	1937	533½
Continuous Girder .	Mangfall	Germany	1935	354

Vertical Lift . . .	Cape Cod canal	Massachusetts	1935	544
Swing Span	Fort Madison	Mississippi river	1927	525
Bascule	Sault Ste. Marie	Michigan	1914	336
Masonry Arch . .	Plauen	Saxony	1905	295

Plans for the reconstruction of the Tacoma Narrows bridge (main span 2,800 ft.—the third longest in the world), which was destroyed by wind action on Nov. 7, 1940, were postponed until after the war. Dismantling of the cables and towers was begun in Sept. 1942, when scrap steel prices made it profitable to tear down these remaining portions of the structure.

A contract was let in 1942 for the strengthening of the Bronx-Whitestone bridge in New York (span 2,300 ft.—the fourth longest in the world) by adding deep trusses to the stiffening girders in order to increase the resistance of the suspension span to aerodynamic undulations.

The world's longest double-leaf bascule span (*see* Table I) at Sault Ste. Marie, Mich., which collapsed under a passing locomotive on Oct. 7, 1941, due to a failure of the interlocking system which permitted a clear signal to be given before the two leaves were properly locked and closed to form a simple truss, was repaired and reopened to railroad traffic in 1942.

Despite the war, construction on the new Waterloo bridge over the Thames in London, Eng., was continued and the partially completed roadway was opened to traffic on Aug. 11, 1942. Demolition of the old bridge was begun in 1935 and construction of the new one started in 1937. It consists of five spans of 238 ft., of cellular construction, with piers and spans of reinforced concrete faced with granite and Portland stone. The bridge deck, providing six lanes of traffic, is 80 ft. wide. The old bridge, a famous structure of masonry arches built by John Rennie in 1811–17, had a roadway width of only 27½ ft.

The Puente Cuscatlan over the Lempa river in El Salvador, completed in 1942 with a main span of 820 ft., is the longest suspension bridge in Central America and a vital link in the Pan-American highway. Each cable is composed of 16 galvanized steel bridge strands of 1$\frac{15}{16}$-in. diameter.

A combination tramway and suspension bridge 1,185 ft. long across the Espiritu Santo river on the boundary line of Brazil and Bolivia, in the jungle regions of the Matto Grosso, was commenced in 1942. Two 100-ft. towers support the tramway cables and the compensating suspension cables. A suspended tram car geared to a two-cable track is capable of carrying 80 persons or a 7-ton truck across the river.

The Howrah bridge over the Hooghly river, India, under construction 1938 to 1942, is a cantilever bridge costing £1,750,000.

The Charter Oak bridge, carrying an express highway over the Connecticut river at Hartford, was completed and opened to traffic as a state-owned toll bridge on Sept. 5, 1942. It has three continuous steel girder spans of 270, 300 and 270 ft. respectively, establishing a new record for the longest continuous plate-girder span in America. The cost is $4,400,000.

A new cantilever bridge at New London, Conn., under construction 1941 to 1942 at a cost of $6,000,000, with a main span of 540 ft., carries an express highway over the deep tidal estuary of the Thames river. Foundations for the main river piers are from 135 to 155 ft. deep. A new interstate toll bridge, spanning the Mississippi river at Chester, Ill., is a continuous truss of two 670-ft. spans. Financed by the city of Chester, it was started in 1940 and completed in 1942 at a cost of $1,090,000.

The new interstate highway bridge across the Mississippi river at Dubuque, Iowa, completed in 1942, is a continuous, through-truss, tied-arch cantilever of novel design, with 845 ft. central span and 347 ft. side spans. The total cost is $3,600,000.

A new highway bridge over the Illinois river at Peoria, Ill., under construction 1941 to 1943, has a three-span continuous truss over the main channel. The cost is $2,000,000.

The new Kentucky river crossing at Cleveland, Ky., under construction in 1942, is the highest highway bridge east of the Mississippi river—250 ft. above the water, with a maximum pier height of 198 ft. It is a three-span continuous truss with spans of 320, 448, and 320 ft. Replacing an old wrought-iron bridge built in 1869, it eliminates several steep grades and dangerous hairpin curves in the highway. The cost is $900,000.

To save steel, a new bridge completed in 1942 over the Brazos river in Palo Pinto county, Tex., is built of native stone. It is 440 ft. long, and consists of a series of 19 stone arches.

The State street double-leaf bascule bridge over the Chicago river, with 245 ft. span, had its completion delayed by priority difficulties. Each leaf will weigh 4,200 tons.

In 1942 the historic iron truss bridge across the Susquehanna river at Havre de Grace, Md., was ordered taken down to yield 3,495 tons of scrap metal for the nation's war drive. Originally a railroad bridge, it became obsolete in 1904. Refused by the county commissioners as a free gift, the bridge was sold in 1910 for $1 to a group of seven citizens for operation as a highway toll bridge; thereafter, with mounting receipts approaching $200,000 annually in tolls, it came to be known as the "Gold Mine Bridge." In 1923 the state of Maryland purchased it for $585,000, and in 1927 an upper deck was added to double the capacity; this operation, adding 1,260 tons of new steel, established a notable pioneer record in structural welding. The following year the bridge was made free as the total investment had been repaid by tolls; and in 1940 the old bridge was superseded by a beautiful modern bridge of the Wichert type, built at a cost of $4,500,000, to accommodate increased traffic requirements at this crossing.

The artistic bridge awards of the American Institute of Steel Construction for bridges completed in 1941 went to the Rainbow bridge at Niagara Falls (a hingeless arch of 950 ft.); the Fairmount Boulevard bridge in Cuyahoga county, O. (a continuous girder of three spans); and the Passaic river bridge of the Lincoln highway in New Jersey (with a lift span of 332½ ft.).

The trend of toll-bridge ownership in the United States is indicated in Table II.

Table II.—*Toll Bridges in the United States*

	1938	1940	1941
Public.	97	114	115
Private	145	120	120
Total	242	240	235

In 1938, tolls paid in the U.S. to cross rivers via bridges, tunnels and ferries amounted to $76,000,000. (D. B. S.)

Briggs, Caspar Warren (1846?–1942), U.S. photographer, was born in Norton, Mass. He bought a magic lantern business in the 1870s and began to manufacture "slip slides." One of the early forms of motion pictures, the slip slides were operated in such a fashion that the figures painted on a lantern slide moved horizontally across a scenic background mounted on another slide. Briggs's first slide production shown throughout the country in magic lantern theatres was *Lincoln's Assassination;* it was followed by such melodramas as *The Drunkard's Daughter, The Bottle, Father, Dear Father* and *Ten Nights in a Barroom.* Others of his stories were taken from the Bible. He won the distinguished service award from the Pennsylvania Arts and Sciences society in 1938 for his work in the field of animated screen pictures. He died in Atlantic City, July 10.

Briquettes, Fuel: *see* FUEL BRIQUETTES.

Bristol, Arthur LeRoy (1886–1942), U.S. naval officer, was born July 15 in Charleston, S.C. He graduated from the naval academy in 1906, and qualified as naval pilot in 1928. During World War I he served with the Atlantic transport force and won the navy cross and the army's distinguished service medal. He was naval attaché in London, 1931–34, commander of the naval air station at San Diego, 1936–39, and in June 1940 he was named commander of carrier division I, aircraft battle force. Adm. Bristol, who was put on duty with the Atlantic fleet in 1941, was promoted to vice-admiral, Feb. 28, 1942. He died in Washington, D.C., April 20.

British Borneo: *see* BRITISH EMPIRE.

British Columbia. The most westerly province of Canada, bordering on the Pacific ocean. The crown colonies of Vancouver Island (1849) and of British Columbia (1858), after uniting in 1866, entered the Canadian confederation in 1871 to form the province. Area, 366,255 sq.mi., of which 6,976 sq.mi. are water. The total population of 817,861 persons (1941) is divided between 443,394 urban and 374,467 rural dwellers. The chief ports of Vancouver (271,597), Victoria, the capital (42,907), and New Westminster (21,602) lie in the southwestern corner—not far from the United States border.

History.—Early in 1942 public concern over the presence of a relatively large group of persons of Japanese extraction prompted the dominion government to expel all Japanese fishermen from that industry, and subsequently led to the gradual removal of this racial group from strategic coastal areas.

In the spring session of the legislative assembly, the coalition government introduced legislation to create a postwar rehabilitation council; ratified an agreement with the dominion government under which the province, in return for an annual dominion payment of $12,048,367.51, consented to withdraw from the income tax field for the duration of World War II; and sought to encourage private interest in the prospects for an iron and steel industry. John Hart, premier and minister of finance, in his budget address, announced an estimated revenue of $33,155,058 and an expenditure of $33,094,292 for the fiscal year ending March 31, 1943. In October, E. C. Carson was appointed minister of mines and trade and industry, succeeding H. Anscomb, who had accepted the portfolio of public works following the demise of R. Bruhn. The remaining members of the provincial cabinet in 1942 included: G. S. Pearson, provincial secretary, labour and fisheries; P. Maitland, attorney-general; K. C. McDonald, agriculture; Wells Gray, lands and municipal affairs; H. G. T. Perry, education and chairman of the postwar rehabilitation council.

In September, Justice G. McG. Sloan, commissioner inquiring into the Workmen's Compensation act and its administration, reported that the act had been efficiently administered and suggested a moderate extension of its coverage as well as certain minor, upward adjustments in the scale of compensation. In October the new Royal Canadian Naval college at Royal Roads, Esquimalt, was commissioned. Completion of the United States-Canadian military highway in November, through northern British Columbia to Alaska, revived interest in proposals to make the province-owned Pacific Great Eastern railway a link in a potential railroad connecting the Pacific northwest states with Alaska.

Education.—During the school year ending June 30, 1941, 119,634 students were enrolled in the elementary (78,306), junior high (14,318), superior (3,442) and high (23,568) schools of the province. Teaching staffs comprised 2,658 teachers in the elementary, 481 in junior high and 1,109 teachers in superior and high schools.

Communications.—Provincial highways in 1940 totalled 21,258 mi. and included 8,376 mi. of surfaced, 10,299 mi. of improved earth and 2,583 mi. of unimproved earth roads. Railway mileage amounted to 3,883 mi. of single track in the same year. The total number of telephones, 167,788, included 32,503 on automatic switchboards.

Manufacturing, Trade, Agriculture, Minerals.—Although affected by the growing shortage of manpower and rising production costs, business activity in British Columbia during 1942 maintained the relatively high level of 1941. Production in the basic industries reached an estimated net value of $343,000,000 in 1941 compared with $302,762,441 in 1940. Salaries and wages paid to employees in the leading industries were estimated at $239,525,459 in 1941, an increase of approximately $51,000,000 over the estimated 1940 gross pay roll of $188,325,766. The impact of wartime conditions created new labour problems for the gold mining industry; led to the sale of the entire 1942 canned salmon pack to Great Britain; and brought enlarged orders for steel cargo vessels to the expanding shipyards from the federal Wartime Merchant Shipping, Ltd.

According to preliminary provincial estimates, the net value of production in 1942 amounted to $60,000,000 (1941, $58,577,539) in agriculture, $30,000,000 in fisheries (1941, $31,732,037); $120,000,000 in forestry (1941, $119,920,000) and $75,000,000 in min-

Economic Activity in British Columbia, 1940-42

	Unit	1940	1941	1942 preliminary estimates
Agriculture:				
Total value of production	$	52,317,121	58,577,539	60,000,000
Livestock	$	5,854,000	7,472,000	7,800,000
Poultry products	$	5,169,000	6,085,000	6,200,000
Dairy products	$	14,218,825	16,209,733	16,900,000
Fruits and vegetables	$	10,150,307	11,782,076	13,100,000
Field crops	$	14,761,000	14,552,000	14,800,000
Fisheries:				
Total value of production	$	21,719,167	31,732,037	30,000,000
Pack of canned salmon	case	1,467,216	2,295,433	1,850,000
Forestry:				
Total value of production	$	102,804,000	119,920,000	120,000,000
Timber scaled	M.B.M.	3,693,155	3,522,750	3,100,000
Paper production	ton	330,572	351,241	350,000
Mining:				
Total value of production	$	75,701,155	78,479,719	75,000,000
Internal trade:				
Index of wholesale sales	1935-39=100	126.1	155.0	175.0
Index of retail department store sales	1935-39=100	116.5	134.8	150.0
Railway freight loaded	ton	7,592,881	9,139,480	9,000,000
Consumption of electric power	000 kw.hr.	2,095,625	2,407,480	2,500,000
Construction	$000	11,929	14,509	9,000
Bank debits	$000	2,137,200	2,427,200	2,700,000
Index of employment	1926=100	113.3	135.6	160.0

ing (1941, $78,479,719). The trend in other business characteristics may be seen from the table on p. 126. (G. N. P.)

British East Africa. Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table. *See* British Empire for population, capital towns, status and governors. (*See* also Rhodesia.)

A civil defense and supply council was set up for the East African colonies. The civil supply board advised on the distribution of imports and essential civil supplies. The war supply board was responsible for the purchase of military supplies of foodstuffs and for the organization of products other than agriculture. The industrial research and development board was investigating substitute fuels, among which are cottonseed oil, power alcohol and charcoal gas. East African troops, both European and African, continued to take part in the North African campaign, and detachments of the King's African Rifles who had been through the Abyssinian campaign, were sent to Ceylon and Madagascar. A number of British officials from Malaya were drafted to East Africa.

Kenya.—Increased production, especially of food supplies for military needs, was the chief objective in Kenya, and 10,000 acres in the Athi plains, formerly a grazing ground for herds of wild animals, were to be devoted to wheat cultivation. The shortage of labour in Kenya, depleted still further by military needs, made the government decide to introduce conscription, especially for farm labour, under regulations laid down with regard to pay and other conditions of work. Army schools were set up for the training of African artisans to serve military needs. More than a thousand men a month were being turned out of these schools as masons, carpenters, joiners, blacksmiths, tailors, electricians, and in other sections as signallers and motor mechanics and drivers.

Uganda.—The Kabaka of Uganda came of age in 1942 and special ceremonies were held at the Baganda capital. The first electric cotton ginnery was established, and two sugar factories to process sugar cane were opened. At Malago hospital Africans were being trained as doctors and medical assistants.

Tanganyika.—An economic control board was set up for the territory. After the fall of Malaya and the Netherlands Indies two of Tanganyika's products, sisal and rubber, became vital to the war effort. All the sisal which was not bought up by the British government was earmarked by the United States. Rubber, however, had the priority over all other production. Old German plantations were revived, the collection of wild rubber organized, and research undertaken at the Amani research station, in co-operation with an official of the Rubber Research institute from Malaya. Two fully qualified African doctors, trained in Uganda, were working in Dar-es-Salaam hospitals. Arrangements were made to receive 5,000 Polish refugees from the U.S.S.R. and Iran in specially prepared camps in the highlands.

Nyasaland.—A successful experiment in African dairy farming in north Nyasaland for making ghee for export was accompanied by the beginnings of small holdings farmed on up-to-date lines. There was a marked improvement in the housing conditions for labour on tea estates. Five months after war savings certificates had been introduced into the country, over £14,000 had been subscribed.

Zanzibar.—The clove industry showed a record export for 1941 in spite of the fact that the main drive was for extended cultivation of food crops, which resulted in a considerable increase in the island's food production.

Somaliland.—At the first big Muslim festival after the victory in Ethiopia, the leading chiefs met the governor and assured him of their support and help. The Somaliland Camel corps destroyed large concentrations of locust hoppers and so saved the land and crops from the ravages of swarms of locusts.

Mauritius.—A special drive to increase food cultivation on the island resulted in one third of all the cultivated lands being under food crops. A successful settlement of the Jewish refugees from central Europe resulted in increased cultivation and the starting of new village industries. (M. Rd.)

British East Africa

Territory and Area in sq.mi.	Principal Products	Imports and Exports Merchandise (in thousand £)	Road, Rail and Shipping	Revenue and Expenditure (in thousand £)	Education: Elementary and Secondary

British Guiana, a British crown colony in northeastern South America. Area, 89,480 sq.mi. Population: 1931 census, 310,933; 1940 official est., 346,982. East Indians are proportionately greater (42.7%) than in any other American area except Trinidad. Negroes aggregate 38.2% of he population, mixed races 12.3%. Almost the entire population ives on the coastal plain. Surveys show, however, that the inerior highlands possess great possibilities for extensive white colonization. Georgetown, the capital (pop. 69,844) and New Amsterdam (pop. 9,913) are the chief cities. The United States n 1942 maintained naval air and patrol bases at Suddie and near Georgetown. Governor (1942): Sir Gordon Lethem.

History.—During 1942 British Guiana felt increasingly the strain of war disruptions of trade and shipping, but was able to withstand the ill effects better than were her sister colonies in he West Indies. This was largely the result of the self-sufficiency program begun early in World War II. Government control of gasoline and power alcohol, subsidies for production of some staple foods, and stringent restrictions of imports were effected, however.

Education.—In 1940 the colony had 238 primary schools, with n enrolment of 55,707, and seven secondary schools.

Finance.—The monetary unit, the British Guiana dollar, tied o the pound sterling at 4.8665 to 1, is normally equivalent to the United States dollar (1942 exchange value: approximately 83 cents U.S.).

Trade.—Under wartime regulations, output and export of certain strategic materials (notably bauxite) were not made public. Statistical information was, therefore, fragmentary, particularly fter 1940. In 1940 imports totalled $14,197,921 (1939: $10,07,506). Great Britain supplied 39% (1939: 45%), Canada 3% (1939: 18%), United States 19% (1939: 14%). Incomplete 941 figures indicated approximately $16,600,000 value, the increase reflecting greater unit costs rather than larger volume. In he first months of 1942, imports declined 8%, primarily the esult of shipping difficulties and of the self-sufficiency program. n 1940 exports were $15,212,223 in value (1939: $14,727,075), with 30% unofficially estimated to represent bauxite (1939: 9.7%).

Communication.—External communication, both by sea and by air, are normally good. Within the colony, however, railways (79 mi.) are confined to the coastal districts, as are most of the 322 mi. of highway. Interior communication is quite primitive and entirely by navigable rivers except for a 102-mi. road to the diamond centres and a cattle trail (182 mi.) to the Rupununi district. In April 1942 the visit of the governor of the Brazilian state of Amazonas served to focus attention again on long-discussed proposals for a railway from the colony's border to Bôa Vista in Brazil.

Agriculture.—Sugar and rice are the main agricultural products. In 1940 sugar (142,707 tons), rum (1,811,635 gal.) and molasses (3,719,531 gal.) made up nearly $10,000,000 of export values in 1940 (1941: $9,000,000 est.). Sugar export to Sept. 30, 1942 was 105,654 tons. Rice (1940: 11,677 tons; first nine months of 1942, 16,720 tons) is exported, especially to the British West Indies. In 1942 an imperial grant of $400,000 was allotted for drainage and irrigation works to extend rice production. In 1942 rubber production was resumed after an 11-year lapse. United States technical assistance and guaranty of purchase through 1946, coupled with a production bonus, was expected to show results by late 1943.

Mineral Production.—British Guiana is one of the world's leading bauxite exporters (1939: 476,013 tons). Under war stimulus the output was greatly expanded. Diamonds (1939: 33,351 carats) and (1940: 35,745 oz.) are also important.

BIBLIOGRAPHY.—*West Indies Year Book, 1941–1942; Canada-West Indies Magazine* (Montreal, monthly); *Crown Colonist* (London, monthly).

British Honduras, a British crown colony in northeastern Central America bordered by Guatemala on the west and by Yucatan (Mexico) on the north. The area is 8,598 sq.mi. Although the Guatemala boundary was formally settled by treaty in 1859, Guatemala officially reopened the question in 1939, but subsequently suspended its claims for the duration of World War II. The population (1931 census: 51,347) was officially placed at 58,759 in 1939. The capital is Belize (1931 pop.: 16,687). Governor in 1942: Sir John Adams Hunter.

History.—During 1942 the already critical economic condition of British Honduras was further disturbed by shipping disruption caused by the serious submarine menace, which brought the war to the colony's doorstep. In June 15 persons were arrested as enemy agents who had been furnishing axis submarines with information and supplies. The leader of this gang, which had close liaison with a spy ring in Panama, was identified by police as a local resident. No official announcement was made as to their fate.

Education.—There were 106 elementary schools in 1942, with an enrolment of over 10,000, and five secondary schools with around 500 pupils. Most, but not all, of the schools receive government financial aid.

Finance.—The monetary unit is the British Honduras dollar, tied to the pound sterling at 4.8665 to 1, and normally equivalent to the United States dollar (1942 exchange value: approximately 83 cents U.S.).

Trade and Resources.—In 1940 exports were valued at $3,039,505 (Br. Hond. currency), imports at $3,318,070. Re-exports to and from adjacent sections of Mexico, for which the colony serves as an important trade intermediary, accounted for 47.3% of all exports in 1940. Imports are largely foodstuffs, textiles, machinery and other manufactured goods, supplied mainly by the United States, Great Britain and Canada. Normally, 80% of domestic exports are forest products (mahogany logs, mahogany timber and chicle), with the remainder almost entirely agricultural, principally bananas, grapefruit and coconuts. Under war conditions, however, the export markets for fruits was lost except for dehydrated and other concentrated forms. Rubber development was stimulated during 1942, however, with a United States Rubber Reserve company contract to purchase all production until the end of 1946.

Communication.—Belize normally enjoys regular steamer service to New Orleans, Kingston and Tampa. The TACA (Central American Air Transport) air lines provide service to San Pedro Sula, Honduras. Domestic transport is by navigable rivers, 25 mi. of railway and 185 mi. of improved highways. There are only a few subsidiary roads. In 1942 a highway from Belize to Cayo (near the Guatemala border), to cost £187,500, was authorized. (*See* also WEST INDIES, BRITISH.)

British Legion.

The year 1942 saw the twenty-first birthday anniversary of the Legion. In these 21 years, millions of ex-service men and their dependents had been made happier and more contented by the Legion's pensions work, expenditure on benevolent aid had grown from £160,000 in 1922 to £466,563 in the peak year before World War II and 394,725 vacancies had been filled by the employment department in the 12 years ending 1941. The annual Poppy day appeal for funds had risen from £106,000 in 1922 to £752,000 in 1941, the total collected in the 21 years being £9,000,000.

The planning committee of the national executive council issued interim reports during the year on post-war problems. These included schemes for land settlement and the employment of demobilized men in the civil service. The internal re-organization of the Legion to provide for expansion after the war was under consideration. Benevolent grants, after falling for a period, had recently gone up by 15% to 20%. The immediate pensions aims of the Legion were to raise the pensions payable to men of World War II to the level of those paid to the men of World War I, and to extend the system of independent appeals tribunals to men and women of World War II. It achieved one of its objects in raising the pensions of totally deaf men to 100%, on a parity with the blind. Membership of the Legion, which fell for a period when war broke out, had been restored to its old strength.

History.—The Auxiliary Military Pioneer corps raised in the three protectorates received high praise from the military authorities. In Aug. 1942 there were 20,000 of these men on active service in the middle east, and another 15,000 in training. Chief Tshekedi and five other Bechuanaland chiefs went to the middle east to visit their men. They found them in the heavy repair workshops dismantling engines, working as motor mechanics, volunteering for dangerous work in the fire services, supervising Egyptian labourers on construction work. Before the Swazi troops went north, their paramount chief presented them with the Swazi colours, which were dedicated by the archdeacon. Cotton growing was promoted in Swaziland by the Empire Cotton Growing corporation, and some 60 Swazi farmers were cultivating cotton on their lands on up-to-date lines. The three protectorates continued to give generously to war funds. The Bechuanaland protectorate arranged broadcasting for Africans from Mafeking. Receiving sets with loud speakers were installed in the principal towns and villages. (M. RD.)

British West Africa.

Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given in the table on page 131. *See* BRITISH EMPIRE for population, capital towns, status and governors.

Lord Swinton was appointed as minister of state in West Africa and made the Gold Coast his headquarters, using part of the buildings of Achimota college. He toured all the West African colonies and interviewed leading Africans as well as Europeans. Broadcasting and information services were considerably developed in 1942, and the station at Accra now reached all West

Africa, and was broadcasting in several languages. A number of Africans went to England to be trained as technicians in various branches of munitions and other war production work. Additional labour officers and experienced trade union organizers were sent from England to Sierra Leone, the Gold Coast and Nigeria. Army schools were opened in the Gold Coast and Nigeria for training clerks and artisans to serve with the military forces.

Nigeria.—After the fall of Malaya, the Nigerian tin mines became vital to the Allies and they were working to their maximum production. To ensure an adequate labour supply, conscription of Africans for the mines was permitted under certain safeguards. A school of forestry was opened at Ibadan with the object of providing an adequate supply of trained Africans for the forestry department. The first Nigerian woman to become a barrister was appointed as an acting magistrate of Ikeja district. Two Africans who had taken B.Sc. degrees in England were appointed as cadet education officers. The alake of Abeokuta said in his address on the 21st anniversary of his accession that the external signs of progress in his country were evident in the macadamized roads, electric power, stone buildings in towns and improved villages.

Gold Coast.—The lands belonging to the Asantahene, the African ruler of Ashanti, were formally restored to the Stool in a ceremony held at Kumasi. The African ruler of Ashanti was made zone organizer of the home guard with the honorary title of lieutenant-colonel. The first African to receive the king's commission as an officer in the British army was from the Gold Coast, and two Africans were appointed as cadet officers in the administrative service. A report on education based on a five-year's survey envisaged an extension of school facilities to cover all children of school age.

Sierra Leone.—Measures for air raid precautions and civil defense became increasingly important in view of the position of the colony on the coast. Special measures were taken to increase the cultivation of rice to assure the food supplies of the colony.

Gambia.—The British government again undertook to buy the complete output of ground-nuts, the most important export crop in the colony.

St. Helena.—The manufacture of hemp in the island continued, as the necessary supplies of fuel were obtained from South Africa. Food supplies were strictly rationed, but production of food crops increased locally. (M. RD.)

British West Indies: *see* WEST INDIES, BRITISH.

Broadcasting: *see* RADIO.

Bromine.

The series of increased outputs that prevailed after 1933 brought the production of bromine in the United States in 1941 to 34,159 short tons, from 14 plants. The production of bromine as a by-product of the recovery of magnesium in sea water was expected to contribute a further increase in 1942. (G. A. RO.)

Brooke, Sir Alan Francis

(1883–), British army officer, was born at Baguères de Bigorre, France, on July 23, the son of Sir Victor Brooke. After completing his studies at the royal military academy, Woolwich, he joined the royal field artillery in 1902. He was stationed in Ireland from 1902 to 1906, then India. At the outbreak of war in 1914 he went to France. Advancing rapidly, he was soon recognized as an authority on artillery and was a general staff officer of the royal artillery at the time of the armistice. After the war he joined the staff college, Camberley, and the imperial defense college, and from 1929 to 1932 he was commandant of the school of artillery. After duty at various other military posts he was appointed in 1939 commander in chief of the anti-aircraft command. When Germany invaded the Low Countries on May 10, 1940, Brooke was commander of the B.E.F. 2nd corps in France. His guarding of the British retreat from Flanders was an important factor in the successful evacuation at Dunkirk. Back in England early in June, he hastily reassembled British military manpower for the expected nazi invasion and prepared a formidable series of defense zones. For his work in Flanders he was knighted, and on July 19, 1940, he was appointed to succeed Sir Edmund Ironside as commander in chief of the home forces.

On Nov. 18, 1941 Brooke was appointed chief of the British imperial general staff to succeed Sir John Greer Dill. Sir Alan accompanied Churchill on his visit to Washington in June 1942 and on his trip to Moscow in Aug. 1942.

Brookings Institution.

Much of the research program of the Brookings institution in 1942 was devoted to problems connected with the war effort or with the maintenance of democracy in the light of critical world conditions. Among the book-length studies published were the following: *American Highway Policy,* by Charles L. Dearing, a presentation of policies needed in order to insure the proper distribution of the cost burden among the various classes of highway users; *Refugee Settlement in the Dominican Republic,* conducted by a staff of seven under the direction of Dana G. Munro, which surveyed the possibilities of refugee colonization offered by the republic, in the light of its economic and agricultural resources; *Democracy, Efficiency, Stability* and *Peace Plans and American Choices,* both by Arthur C. Millspaugh, the former dealing with the problems involved in reconciling the operation of the democratic process with efficient and stable government and the latter concerning international alternatives which the United States may have to face after the war.

A series of pamphlets on the subject of price-making in a democracy was published under the authorship of Edwin G. Nourse. Other pamphlet studies included the following: *German Manpower: The Crucial Factor,* by Fritz Sternberg; *Automobile Transportation in the War Effort,* by Charles L. Dearing; *Will Electric Power Be a Bottleneck?* by Louis Marlio; *French Price Control,* by Louis Franck.

The institution suspended the granting of fellowships for advanced study for the duration of the war. The facilities ordinarily utilized by holders of fellowships were made available to the National Institute of Public Affairs for the use of students being trained in government departments. (H. G. Mo.)

Brooklyn-Battery Tunnel: *see* TUNNELS.

Brown, Wade Hampton (1878–1942), U.S. pathologist, was born Oct. 18, in Sparta, Ga. He received a B.S. degree from the University of Nashville, 1899, and an M.D. from Johns Hopkins in 1907. After teaching pathology at the universities of Virginia, Wisconsin and North Carolina, he joined the Rockefeller institute in 1913 as an associate in pathology and bacteriology. He was made a member of the scientific staff for medical research in 1922. During his association with the institute, he specialized in the study of syphilitic infections and the relation of environment to disease. He made important contributions in the chemotherapy of spirochaete and trypanosome infections. He died at Rice Lake, Wis., Aug. 4.

Brunei: *see* BRITISH EMPIRE.

Bryn Mawr College. A resident college for women at Bryn Mawr, Pa. (eight mi. from Philadelphia). Katharine Elizabeth McBride, former dean of Radcliffe college, was inaugurated as the fourth president of Bryn Mawr college on Oct. 29, 1942. She succeeded Marion Edwards Park, who reached the age of retirement. The college, while maintaining its regular academic work, added special war courses in elementary Russian; postwar reconstruction, by the department of economics and politics; techniques of translating, interpreting and analyzing, by the department of French; photogrammetry and mapping, by the departments of geology and mathematics; and the theory and practice of democracy, an interdepartmental course. The courses in photogrammetry were practical and were based on laboratory and field work. For statistics of enrolment, faculty, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (K. E. M.)

Bubonic Plague: *see* PLAGUE, BUBONIC.

Buckner, Thomas Aylette (1865–1942), U.S. insurance executive, was born Jan. 18, in Bloomingdale, Ill. At the age of 15, he started as office boy in the New York Life Insurance company and worked up to president of the company, 1931–36. He was chairman of the board, 1936–41, later becoming chairman of the finance committee. He retired from active service at the end of 1941, remaining as director. Buckner died in New York city, Aug. 8.

Buckwheat. Production of buckwheat in the United States in 1942 was estimated Nov. 1 by the department of agriculture as 6,412,000 bu., compared with 6,392,000 bu. in 1941 and a 10-year (1930–39) average of 7,315,000 bu. Production in Canada was officially estimated at 5,110,000 bu. in 1942 and 4,788,000 bu. in 1941. Average yield in the United States was 17.7 bu. in 1942 and 17.9 bu. per ac. in 1941.

Table I.—*Estimated U.S. Production of Buckwheat in Leading States, 1942 and 1941*

State	1942 bu.	1941 bu.	State	1942 bu.	1941 bu.
New York . .	2,257,000	2,282,000	West Virginia .	216,000	254,000
Pennsylvania .	2,028,000	2,300,000	Ohio	140,000	192,000

Wisconsin . .	238,000	188,000	Maine	102,000	144,000

Table II.—*Canadian Production of Buckwheat in Leading Provinces, 1942 and 1941*

Province	1942 bu.	1941 bu.
Ontario	2,545,000	2,326,000
Quebec	1,785,000	1,773,000
New Brunswick.	552,000	483,000

(S. O. R.)

Budenny, Simeon Mikhailevich (1876–), Russian soldier, was born April 25 in Koziurin, in the Don basin, the son of a Cossack farmer. (See *Encyclopædia Britannica.*) He entered the Moscow military academy in 1928, and was graduated with honours in 1932. Budenny, who became a marshal of the soviet union in 1935, was made commander in chief of the Moscow district in 1937. He played an outstanding role in the final victory over the Finns in 1940, and in Aug. 1940, he was made first vice-commissar of defense. In July 1941, after the outbreak of war with Germany, he was appointed commander in chief of the Russian armies defending Kiev and the Ukraine. Following Stalin's "scorched earth" policy, Budenny's retreating armies blew up the huge Dnieper river dam in Aug. 1941. He was shifted from the southern front Oct. 23, 1941 and was charged with formation of new Russian armies. Budenny thereafter dropped out of public notice.

Budgets, National. President Roosevelt's second war budget covering the fiscal year 1944 was submitted to congress on Jan. 11, 1943. It was designated as a budget presenting the maximum program of the United States for waging war, in contrast to the previous year's budget, which the president had called an instrument for transforming a peace economy into a war economy. The figures for the fiscal year 1944 were truly staggering, so far outstripping previous budgets as to make comparisons almost meaningless. Total government expenditures for the fiscal year 1944, exclusive of government corporations and agencies, were estimated at more than $104,000,000,000, while revenues on the basis of tax legislation were expected to yield more than $35,000,000,000. The president recommended that congress consider additional taxes or forced savings to yield not less than $16,000,000,000. In the fiscal year 1940, immediately preceding the defense program, government expenditures totalled $8,998,000,000, while gross receipts were $5,924,000,000.

Completely dominating the expenditures side of the maximum war budget were the contemplated expenditures for war activities. Within the budget proper, war expenditures for fiscal year 1944 were estimated at $97,000,000,000, while an additional expenditure of $2,693,000,000 for war purposes by the various government corporations and agencies was anticipated.

The budget did not include detailed estimates of war expenditures because of the possible use of such information by the enemy. However, it did show the broad categories of war expenditures, revealing that munitions alone would amount to $66,000,000,000 in the fiscal year 1944, as compared with $43,000,000,000 in the fiscal year 1943. The other major items were: military and civilian pay and subsistence, $21,000,000,000; industrial construction, $2,000,000,000; other construction, $5,000,000,000; other expenditures, including agricultural lend-lease, $6,000,000,000. It

Table I.—*General Budget Summary of the United States*

Classification	Estimated 1944	Estimated 1943	Actual 1942
General and Special Accounts			
Receipts (based on present legislation)*:			
Direct taxes on individuals	$13,750,600,000	$ 8,338,500,000	$ 3,695,340,677.95
Direct taxes on corporations	14,915,000,000	10,070,000,000	5,021,578,715.65
Excise taxes	3,915,380,000	3,678,110,000	3,127,631,235.25
Employment taxes	1,982,200,000	1,472,300,000	1,194,046,888.42
Customs	204,300,000	252,600,000	388,948,426.88
Miscellaneous receipts	639,215,000	740,745,000	277,376,297.34
Adjustment to daily treasury statement basis	...	...	—37,007,417.65
Total receipts	35,406,695,000	24,552,255,000	13,667,914,823.84
Deduct:			
Net appropriation for federal old-age and survivors' insurance trust fund	1,525,450,000	1,076,180,000	868,853,202.82
Postwar credits for excess profits tax and Victory tax	800,000,000	500,000,000	...
Net receipts, general and special accounts	33,081,245,000	22,976,075,000	12,799,061,621.02
Expenditures:			
War activities	97,000,000,000	74,000,000,000	26,011,065,089.39
Interest on the public debt	3,000,000,000	1,850,000,000	1,260,085,336.46
Other activities:			
Legislative establishment	27,455,600	27,042,300	27,268,973.19
The judiciary	12,663,500	12,118,100	11,537,736.82

*Does not include proposal for $16,000,000,000 additional funds from new legislation for the fiscal year 1944.

†Includes net war expenditures of $2,254,949,959 for 1942 and estimates of $3,332,000,000 for 1943 and $2,693,000,000 for 1944.

Source: Budget statement sent to congress by President Roosevelt Jan. 11, 1943.

as interesting to note that, ith the nation reaching a full ar footing, total war construc- on expenditures would decline rom $14,000,000,000 in fiscal 943 to $7,000,000,000 in the ollowing year.

The president emphasized in is budget message that this ar program should not be con- idered fantastic, since it was ntirely feasible if the nation's nanpower and resources were ully harnessed. He particularly nentioned the necessity of chieving the maximum possi- le productive effort so that es- ential civilian needs could be net at the same time with an ll-out war effort. To accom- lish these objectives it would e necessary to utilize all avail- ble manpower, equipment and aw materials in the most ef- ective way. Although 10,000,- 00 people had already been dded to the employed and the rmed forces since the summer f 1940, about 6,000,000 addi- ional would be needed during he calendar year 1943 for the rmed services and war produc- ion. To meet this requirement, would be necessary not only o mobilize and train a reserve f women and young people, ut to accelerate the shift of abour from nonessential to es- ential industries, and to re- uce turnover and migration of abour.

With the nation's economic esources working effectively, President Roosevelt declared hat essential civilian needs ould be met in addition to the $100,000,000,000 war program. It was estimated that these needs vould average about $500 of goods and services per person dur- ng 1943–44. The level of consumption would represent a reduc- ion of almost 25% from the record of the calendar year 1941.

The other major item on the expenditures side of the budget o show a striking increase was interest on the public debt. For he fiscal year 1944 interest charges were estimated at $3,000,- 00,000 as compared with $1,260,000,000 in 1942 and $1,850,- 00,000 in 1943. This precipitous increase resulted from the rise n the volume of debt outstanding, interest rates on the govern- nent debt being held at relatively low levels.

For the total of all other expenditures of the federal govern- nent, the budget for 1944 showed a continuation of the decline hat had characterized the previous few years. Expenditures on hese nonwar activities were estimated at $4,128,924,000 for the iscal year 1944 as compared with $4,587,000,000 and $5,220,000,- 00 in the years 1943 and 1942, respectively. In recognition of ublic agitation for a reduction of nonwar expenditures, the resident explained this item in some detail in his budget message. He said, "Actually, the 'nonwar' classification now has little, if any, meaning. Most of these expenditures are related to the war effort and many are directly occasioned by it." While expressing his desire to co-operate with the congress in effecting further reductions in nonwar expenditure, he emphasized that both the congress and the nation should realize "that we are fast approaching the subsistence level of government—the minimum for sustaining orderly social and economic processes—and that further reductions will necessarily be of much smaller magnitude than those already achieved."

The major categories of nonwar expenditures which were decreased in the budget were those which had grown up in the course of the depression years. The general public works program was to be cut to approximately $350,000,000 from almost $577,000,000 in the fiscal year 1943. No allowance was made in the budget for aids to youth, and only $5,500,000 for work relief, whereas these two items had been $250,000,000 and $937,000,000, respectively, in the fiscal year 1942. Aids to agriculture were estimated at $889,000,000 as compared with slightly more than

$1,000,000,000 in the two preceding years. The food stamp plan was to be discontinued, and various other curtailments were to be made. However, the president considered that a large agricultural program was still essential to secure the food needed for victory. The only significant increase among the nonwar expenditures was veterans' pensions and benefits, which were expected to rise to $879,000,000 in fiscal year 1944 as compared with $551,885,000 in 1942.

Table II.—*Government Receipts and Expenditures—Great Britain*

(£'000)

Receipts	Actual Receipts 1941–42	Estimate for 1942–43
Inland Revenue:		
Income tax	769,657	913,000
Surtax	74,937	78,000
Estate duties	90,870	90,000
Stamps	14,133	15,000
National defense contribution	21,883	425,000

Self-balancing Revenue and Expenditure		
Post office	93,746	102,523
Broadcasting	6,836	....
Total	100,582	102,523

*In addition, £8,700,000 was issued to the Post Office from votes of credit in 1940–41 and £4,970,000 was estimated to be so issue in 1941–42.

With new revenue acts having been passed in each of the years 1940, 1941 and 1942, it was estimated that federal revenues in the fiscal year 1944 would reach the record total of more than $35,000,000,000, as compared with $24,552,000,000 in 1943 and $13,668,000,000 in 1942. By 1944, direct taxes on individuals and corporations would constitute the overwhelming bulk of federal revenues, accounting for almost $29,000,000,000. In 1942 these classes of taxes had yielded less than $9,000,000,000; in 1940, $2,125,000,000.

On Oct. 20, 1942, the largest tax bill in the nation's history was enacted, providing additional revenue of nearly $7,000,000,000 for a full year of operation on the basis of the income level of 1942. Because the increase in government expenditures was much more rapid than the increase in revenues, the president recommended that additional funds be sought by new legislation. He suggested a goal of $16,000,000,000 for the fiscal year 1944, which would mean that approximately 50% of federal expenditures would then be met by current receipts. The new revenues were to be taxes, forced savings or both. Above all, the president emphasized the necessity for additional taxes in order to buttress the government's price stabilization program. While it was recognized that the major reliance in the prevention of inflation was being put upon direct price control and rationing, the need for a large enough tax program to make these direct controls workable, was stressed.

The federal deficit for the fiscal year 1944 was estimated at slightly above $71,000,000,000, as compared with $57,461,000,000 in the previous year and slightly less than $20,000,000,000 in fiscal 1942. If the president's revenue recommendations were followed, the deficit in 1944 might be held to $55,000,000,000. In any case, an increase in the public debt to approximately $200,000,000,000 by the end of the fiscal year 1944 was in prospect. (*See* also NATIONAL DEBTS; NATIONAL INCOME AND NATIONAL PRODUCT; TAXATION; UNITED STATES.)

Great Britain.—The budget messages for the fiscal years 1941–42 and 1942–43 were concerned not so much with the purely bookkeeping aspects of government receipts and expenditures as with the problem of how the vast sum required for war purposes could be spent by the government while yet avoiding an inflation of prices and the cost of living. It was made clear that this problem had to be met by eliminating the "inflationary gap"—the excess of probable private and government expenditures over the total value of goods and services available for purchase without a rise in prices. The chancellor of the exchequer, Sir Kingsley Wood, was more interested in offsetting this gap—which he estimated at about £500,000,000 in 1941–42—than in the budget deficit of £2,420,597,000. Since closing the ga necessitated a reduction in total expenditures and since th government expenditure was necessary for the war effort, it wa evident that private expenditure had to be reduced. It wa proposed that half the gap be met by increased taxation an half by increased saving on the part of the public.

There were two innovations in connection with the income ta proposals. The first was that the graduation of the surtaxes o the higher incomes was so steep as to constitute an effectiv ceiling on personal income after taxes at about £4,000. T retain this amount required a gross income in the neighbourhoo of £30,000, and there were only about 1,000 incomes of thi size or larger in Britain. The steepness of the graduation in th higher brackets might be judged from the fact that whereas hal of a gross income of £4,000 would go for taxes, a taxpayer wit a gross of £100,000 would be left with less than £6,000.

The second was the adoption of the "forced saving" plan firs proposed by John Maynard Keynes. It provided that the increased income taxes paid by individuals because of lowere exemptions and allowances be credited to the taxpayer and repaid to him after the war. Since there was a fairly low uppe limit to the rebate, this provision primarily benefited person at the lower end of the income scale. The plan had a twofol objective. It was designed to hold out the promise of greate economic well-being after the war for the heavy sacrifices required during the conflict. It also aimed to provide a pool o purchasing power after the war to cushion the readjustment t a peacetime economy and thus prevent severe depression.

Because the additional administrative controls of maximum prices and rationing were working fairly effectively in holding dow inflation, and because the budget for the previous year had com very close to exhausting the effectiveness of the fiscal instrument, the budget for the fiscal year 1942–43 contained onl minor changes. In all, it was expected that the scale of expenditures would be raised by £500,000,000 while a slightly large increase was expected in total revenue inclusive of proposed ta changes. The deficit would remain, therefore, approximately th same as in the previous year, a little in excess of £2,500,000,000

The changes in taxes that were recommended were all of relatively minor character. In order to iron out some inequities and to provide incentives in special cases, the total yield of the income tax was actually to be reduced. The increased taxes were confined to such things as alcoholic beverages, tobacco and amusements. On a wide range of luxury goods the rate of purchase tax was to be doubled so that the tax would equal two-thirds of the wholesale value.

The statistics of American lend-lease aid to Britain were not included in the budget proper but, in his budget message, Sir Kingsley Wood expressed the gratitude of Britain to the United States for the immense contribution which was being made to the British war effort by this assistance. (M. Gt.)

Building Industry. The year 1942 saw an almost complete cessation of construction in the U.S. except for military or war production purposes. All residential construction was restricted to war production areas. Therefore the construction figures for 1942 reflected an over-all drop of 34% from 1941 in new family dwelling units started. They also reflected the fact that only low cost housing was built. The bureau of labour statistics reported that "dwelling units with permit valuations or estimated construction costs of $3,000 to $3,999 were most common, accounting for more than a quarter of all privately financed units. In New England and the east north central states the most frequently reported cost was from $4,000 to $4,999. In both the south Atlantic and east south central states the largest group of units was in the cost class of $2,000 to $2,999."

Because metals, lumber and many plastics were needed to manufacture materials of war, the War Production board in 1942 put a tight clamp upon the amount of critical material allotted to construction. Sudden freezing orders, occasioned by military demands or by unforeseen bottlenecks of supply, caused great hardship to the construction industry. Many housing projects lay idle because of inability to get sewers, or electric wiring, or water mains. In May, WPB issued an order freezing the sale and delivery of softwood lumber for 60 days. (This was later modified.) In September the lumber supply grew very acute. The lumber industry was not able to keep pace with the heavy war demand because it was losing its skilled and unskilled labour to the armed forces and to war industries paying higher wages.

The National Housing agency and the War Production board (*qq.v.*) were forced to save materials (1) by building only for workers in areas where there were no available dwelling units; (2) by curtailing the number of family dwellings built; (3) by curtailing the amount of critical material used in family dwelling units; (4) by programing a large quantity of temporary family dwelling units using less critical material, and a large quantity of dormitory units and apartments using less critical material per person than would be used in family dwelling units; (5) by urging the conversion of large single family houses, lofts, office buildings, etc., to multifamily use; (6) by urging families in war production areas to rent all spare rooms to war workers; (7) by encouraging builders to use substitute materials.

PORTABLE SHELTERS for migratory labourers being assembled at Swedesboro, N.J., in May 1942. Such shelters were also considered for possible future use in bombed areas

The demountable house excited the imagination of many in 1942 and the denunciation of others. It was used in many areas to provide emergency housing for war workers. In 1942 it furnished a psychological guarantee to the community that it would not remain there if there was no future need for it.

New Construction Activity in the United States by Function and Ownership, 1940-1942

(Millions of dollars)

Item	1940	1941	1942

Great Britain.—During 1942 the building industry passed the peak of production in June, when a special urgency program was initiated by the government, mainly in the provinces. The "flying squads" of mobile builders organized by the ministry of works were very successful in dealing with air-raid damage and in the preparation of site construction camps. All repairs, alterations, maintenance and private work were drastically reduced; the total amount of new work and the total amount of labour was, at the close of the year, not more than 60% of the normal.

A levy of 3*s.* per 1,000 was imposed on bricks, the revenue to be applied to the care and maintenance of closed brickyards to ensure that such works would be ready to resume production immediately hostilities ceased. This revenue during 1943 was estimated at £300,000. Bonuses were being paid to building and civil engineering operatives whose output was higher than "basic" for all main building and civil engineering operations on over 2,000 government sites which were scheduled as "essential works."

Interest was increasingly focussed upon postwar planning. The reports of the Scott, Uthwatt and Royal Institute of British Architects committees were outstanding. The Scott committee, before which 10 government departments and 42 other bodies and organizations gave evidence, was concerned with land utilization in rural areas. The Uthwatt report concerned an objective analysis of the payment of compensation and the recovery of betterment in respect of public control of use of land. The R.I.B.A. statement covered a wide field and embraced planning and amenities, housing, building, legislation, architecture, the building industry and building technique.

(*See* also Business Review: *Industrial Groups;* Housing; United States.) (N. Ke.)

Bulgaria. A kingdom in the Balkan peninsula. Area (end of 1940) *c.* 42,796 sq.mi.; pop. (est. 1942) 8,700,000. Capital: Sofia. Chief cities: Sofia (327,000), Philippopolis or Plovdiv (99,883), Varna (69,944), Ruschuk or Russé (49,447), Burgas (36,230), Plevna (31,520). Religion: mainly Greek Orthodox; about 1,000,000 Moslems; 50,000 Jews. King: Boris III; premier (1942): Professor Bogdan Philoff.

History.—The year 1941 had witnessed the open and full-hearted alignment of Bulgaria on the side of the axis powers. As a result of the disintegration of Yugoslavia and Greece under German pressure, Bulgaria had added to its territory Greek Macedonia, with about 25,600 sq.km. and 1,600,000 inhabitants, and western Thrace, with 8,712 sq.km. and about 350,000 inhabitants. From Yugoslavia, Bulgaria got southern Serbia, with about 26,000 sq.km. and a population of 1,500,000. Three new provinces were created, those of Bitolj, Skoplje and Xanthi, so that Bulgaria counted at the end of 1942 ten provinces. During the whole year Bulgaria continued its fascist regime under the king's personal dictatorship. Though all the worst features of the fascist regimes were adopted, Bulgaria did not participate in the war against the soviet union, because the sympathies of the Bulgarians, who are Slavs, had been traditionally on the side of Russia. The Bulgarian government did, however, declare war on the United States of America, and its fascist policy went so far as to suppress all Rotary clubs and Y.M.C.A. organizations and to liquidate their properties. Though the number of Jews in Bulgaria amounts to much less than 1% of the total population, the anti-Semitic legislation closely imitated the national socialist laws and practice and distinguished itself by a thoroughgoing barbaric treatment of the small Jewish minority. Similarly there were bitter complaints from the Greeks and Serbs in the newly-occupied countries about the harshness and cruelty of the Bulgarians.

At the end of March King Boris visited Chancellor Hitler, who demanded an active support of Bulgaria in the Russian campaign. As a result of this visit, the Bulgarian premier, Bogdan Philoff, declared that "the destruction of Bolshevism" was essential, but Bulgaria still refused to participate actively in the war against Russia. A majority of the parliament refused to approve the far-reaching demands of Hitler. As a result the cabinet resigned on April 11. Several ministers, especially the foreign minister, Ivan Popoff, and the minister of war, General Theodossy Daskaloff, did not join the new cabinet formed by Premier Philoff. The premier became foreign minister, and General Mishoff, commander of the army corps of Sofia, became minister of war. The powerful ministry of the interior remained in the hands of Peter Gabrovsky. It was decided to celebrate April 12 of each year—the date of the union of Macedonia and Thrace with Bulgaria—as the day of the unification of Bulgaria.

In his declaration for the new cabinet, Premier Philoff promised the maintenance of a strong and well-equipped army, the liquidation of all remnants of democratic and liberal ideologies and their representatives, strict enforcement of the anti-Semitic legislation, and stern measures against threats of communists within the country. Thus the new cabinet mirrored the firm determination of the king to maintain closest collaboration with the axis, against a definite opposition within the country. On April 12, the new national holiday, German, Italian and Japanese flags and immense pictures of Chancellor Hitler, Premier Mussolini and the Japanese emperor decorated Sofia.

The strength of the unrest in the country was shown when several leading Bulgarians, among them General Vladimir Zaimoff, former Bulgarian minister of the interior, were executed as "tools of Bolshevism." Concentration camps were reported filled to capacity with political prisoners. The unrest grew with the loss of German prestige following the successful resistance of the Russians. In Sept. 1942 the American college in Sofia was closed and the Americans connected with the college were expelled. The food situation also worsened. On Oct. 7 an Italo-Bulgarian treaty was signed regarding the construction of a motor highway from Durazzo in Albania to Sofia, but the Italians did not succeed in receiving an increased export of foodstuffs from Bulgaria.

Education.—Though elementary education is obligatory and free for children between the ages of 7 and 14, the census of 1934 showed 20.4% of the males and 42.8% of the females illiterate. In 1939 there were in Bulgaria 252 kindergartens, 4,743 elementary schools, 1,932 junior high schools and 112 senior high schools with 969,599 pupils. There is one university in Sofia, with an enrolment of 4,377 men and 1,653 women students.

Defense.—Compulsory military service was introduced in May 1940. All men from 17 to 65 were made liable to service. Bulgaria then tried to build up an efficient army, though an air force and modern equipment were lacking.

Finance.—The revenue for 1941 was estimated at 10,160,000,000 and the expenditure at 10,096,000,000 leva. On June 30, 1940, the total foreign debt amounted to 12,483,000,000 leva, the internal debt to 11,767,000,000 leva, of which 9,237,000,000 leva was not consolidated. The monetary unit is the lev, stabilized at 92 leva to one gram of fine gold (equal to .95 cent U.S. at the end of 1941). The note circulation on June 30, 1941, was 8,861,000,000 leva.

Trade and Communication.—Imports amounted in 1940 to 7,028,000,000 leva. Most of the imports came from Germany, with Italy second. The exports for 1940 amounted to 7,019,000,000 leva, of which by far the greatest part went to Germany. In 1939, machinery and war material ranked first among the imports to Bulgaria, followed by metal goods, textiles, vehicles and mineral oils. Among Bulgarian exports, tobacco ranked first, followed by fruit, eggs, wheat and hides. Though Bulgaria has two important ports at the Black sea and some on the Danube, its mercantile marine consisted only of 14 ships of 17,476 tons in June 1939. At the same time it had 2,211 mi. of railroad, all belonging to the state, 806 post offices, 798 telegraph offices and 772 telephone exchanges.

Agriculture and Mineral Production.—More than 80% of the population was engaged in agriculture in 1942. The main crops are wheat, maize, barley, rye and oats. Fruit-growing is highly developed, also the growing of tobacco, and silkworm cocoons. Though the country is rich in coal, industrial development has been slow. Of other minerals there is only some aluminum and salt. (H. Ko.)

Bureau of Standards, National: *see* STANDARDS, NATIONAL BUREAU OF.

Burma. A British province lying on the eastern side of the Bay of Bengal, between India and Thailand. Area 261,610 sq.mi.; pop. (1941) 16,823,798. Chief cities: Rangoon (cap., 498,369); Mandalay (est. 150,000), Moulmein (70,000). Religion: Buddhist (85%); governor (1942): the Rt. Hon. Sir Reginald Dorman-Smith; prime minister: the Hon. Sir Paw Tun; languages: Burmese and English.

History.—The Japanese military campaign in Burma was short and sharp. Decisive battles of the Salween and the Sittang rivers were fought quite early in 1942. The vital port of Rangoon was repeatedly bombed, causing dislocation of essential services, and became untenable in March. The most complete and effective act of voluntary destruction of the oilfields and installations was carried out at Yenangyaung and Syriam. By May the Japanese were in occupation of practically the whole country.

In June the governor, Sir Reginald Dorman-Smith, together

HOUSES OF MAYMYO, headquarters of U.S. Gen. Joseph Stilwell in Burma, aflame after a Japanese raid early in April 1942. By May 7, 1942, all of Burma was in Japanese hands

with the prime minister, Sir Paw Tun, the finance minister and judges of the Burma high court, established their headquarters in India.

On Aug. 1 the commander-in-chief of the Japanese troops in Burma introduced a system of joint Japanese and Burmese administration under Dr. Ba Maw. The key portfolios of finance and defense were held by the Japanese, and policy was the exclusive concern of the Japanese military administration. Supreme power was vested in the Japanese commander-in-chief. The Burma legislature ceased to function, and freedom of the press was not permitted.

Commercially, Burma was badly hit by the loss of her previous export markets, for Japan lacked the shipping to export her surplus rice, while the breakdown of the national transport systems caused serious maldistribution of supplies within the overrun territories. The Japanese set up a committee to organize the reconstruction of the roads, railways and bridges and the restoration of industries. In Rangoon they appointed a Burmese mayor and a Burmese secretary-general. The new government organized a mission to tour the country in order to enlighten the people on the significance of the Japanese "co-prosperity sphere." Schools for the study of the Japanese language were opened in Rangoon. A government resolution urged the use of Burmese as the official language in the courts. Currency adjustments were made; the decimal system was introduced, the cent becoming the new monetary unit with 100 cents to the rupee.

In July Sir Reginald Dorman-Smith, while on a visit to London for consultations, said: "We are going back to Burma. We have got to help the Burmese to rebuild their country, both physically and economically." At the same time the British government, in a statement of intentions, declared that "property and goods destroyed or damaged in Burma should be replaced or repaired as resources permit."

Renewed air and patrol activity against the Japanese in Burma at the end of the monsoon season emphasized the strategic importance of the reconquest of the country.

Education.—In 1940, total number of institutions 27,015, scholars 851,922; primary schools 5,679, scholars 384,060; middle 1,018, scholars 139,190; high 399, scholars 94,353; special 1,172, scholars 19,190; unrecognized institutions 18,745, scholars 212,663; university (Rangoon) 2,365 students; arts college (Mandalay) 101.

Finance.—Revenue (est. 1941–42) Rs.17 crores 13 lakhs; expenditure (est. 1941–42) 18 crores 28 lakhs; public debt (March 31, 1940) Rs.51 crores 22 lakhs; exchange rate: rupee (Rs.1) = 1*s.*6*d.* = approx. 30.3 cents in 1942; one crore = 10,000,000 rupees; one lakh = 100,000 rupees.

Trade and Communications.—Overseas trade in merchandise (April–March 1940–41): imports Rs.29 crores 55 lakhs; exports, including re-exports, Rs. 55 crores 38 lakhs. Communications 1940: roads suitable for motor traffic, all weather, 6,811 mi., seasonal 5,661 mi.; railways, open to traffic, 2,060 mi.; inland waterways (approx.) 1,300 mi.

Agriculture.—Production (1940–41): rice 6,000,000 tons; ground-nuts 160,000 tons; sesamum seed 72,000 tons; cotton 13,000 tons of lint; tobacco 106,869,600 pounds.

Mineral Production.—In 1939, petroleum 275,673,364 gal.; tin concentrates 5,441 tons; tungsten concentrates 4,342 tons; tin tungsten concentrates 5,593 tons; refined lead 76,000 tons; antimonial lead 1,180 tons; zinc concentrates 59,347 tons; copper matte 7,935 tons; nickel speiss 2,896 tons; silver 6,175,000 troy oz.; gold 1,206 troy oz. (Ton = 2,240 lb.). (*See* also JAPAN; WORLD WAR II.) (H. L.)

Business Review. The most distinctive characteristic o 1942 for U.S. business consisted in th increasing pressure of total war on the American economy. Whi industry was making strenuous efforts to maximize output, an many plants were operating on a 168-hr. week, shortages of man power and materials, frozen inventories, frequent changes in plan and other obstacles to production appeared as glaring defects i the productive processes of wartime democracy.

Specific production data were withheld not only from the pub lic but from interdependent industries. Not available were dat on copper deliveries; on zinc, lead, tin and silver output; bitum nous coal exports; auto tire and rubber production; raw silk sup plies; imports of wool, rayon, crude oil, cocoa and coffee; metha nol, ethyl alcohol and cellulose output; gasoline consumption; pi iron and steel ingot production; shipbuilding employment an pay rolls; and other technical key products essential to war pro duction. The government ceased the publication of the index o physical output for the foregoing industries in Feb. 1942, but di release such data pertaining to the most significant industria trends as did not afford "aid and comfort to the enemy," such a those published by the Federal Reserve board and included i Table I. (*See* also WAR PRODUCTION, U.S.)

*Estimated. Federal Reserve *Bulletin.*

Non-Durable Goods Industries.—During 1942, allocations fo non-durable goods were extended. Only for the manufacture foods industries did civilian production of 1942 exceed that o 1941; in all other leading industries the output for civilian use of non-durable goods dropped. Silk output for civilian use reache zero in 1942. For all non-durable goods industries, orders ex ceeded expansion of output, and the most striking gains appeare in wool and woollens, chemicals, rubber and coke production The Federal Reserve board and the U.S. department of commerc issued figures contained in Table II showing relative productio for civilian and war uses in 1942 in selected non-durable good industries.

Industrial Problems.—Although very significant gains in wa production had occurred during the defense and preparednes campaign of industry in 1941, the strenuous efforts made by busi ness to maximize production in 1942 created unprecedented prob lems for business management, labour and government. Chie among these problems were the allocation and rationing of scarc raw materials for production, rationing of scarce finished product for consumption, maximum utilization of available manpower concentration of production for war and civilian use, scrap ac cumulation, and renegotiation of war contracts. For a discussio of the allocation problem, *see* PRIORITIES AND ALLOCATIONS.

Steel Scrap.—The unused capacity of U.S. steel mills reached 67,000 tons in July 1942, primarily because of insufficient suplies of scrap steel and iron. Nation-wide scrap drives were instiuted when it became known that this lack meant a loss of 4,404,-00 tons per year of steel ingot production—an amount about qual to Japanese steel ingot capacity for seven months. The reponsibility for the shortage of scrap steel was shared by the War roduction board, which handled allocations; the Office of Price dministration, which had fixed price ceilings too low upon the dvice of scrap brokers; and the Bureau of Industrial Conservaon and the Metals Reserve company, which was in charge of crap collection. Rumours of racketeering and speculative hoardng by scrap brokers undermined public support.

From July 1941 to July 1942, the scrap steel stock decreased nore than 40%, and the steel industry launched a publicity camaign at a cost of $1,500,000 to stimulate the salvage of scrap and n plate. Results were fairly gratifying but inadequate for the vinter need of 7,000,000 tons. The demand for scrap was made till more acute because 628,350 tons of new steelmaking capacity ad been added by mid-year, and had brought U.S. capacity 50% bove that of the axis countries, which would be meaningless for var purposes unless in actual operation. The steel industry's goal vas 90,000,000 tons, of which half would be supplied from scrap n hand. The year ended with renewed attempts at local scrap rives to increase this supply of vital war material. (*See* also IRON ND STEEL; SALVAGE DRIVES, U.S.)

Rubber.—During 1942, the U.S. crude rubber stock tumbled rom 600,000 to 450,000 tons, and the normal civilian demand ropped to almost zero, while governmental demand became alnost insatiable. Relief for the crucial rubber situation was seured, first, by freezing the sale of new cars on Jan. 1, 1942, thus bruptly curtailing civilian demand; second, by local drives for ubber scrap, started June 15; third, by nation-wide gas rationing, he most effective method of curtailing civilian demand; fourth, y synthetic production, which rose to an estimated 60,000 tons. atin-American sources were expected to add another 100,000 ons of crude rubber, and congress appropriated $75,000,000 for he cultivation of guayule and Russian dandelions as substitutes or raw rubber supplies. The leading rubber companies made huge nvestments in rubber plantations. Farm leaders encouraged the roduction of synthetic rubber from recurrent crops, but the Baruch committee favoured the more economical and expeditious ynthetic production from crude oil, coal and other minerals. *See* also RUBBER AND RUBBER MANUFACTURE.)

Table II.—*U.S. Civilian and War Production of Non-durable Goods Industries for 1941 and 1942 Compared (1935–39 = 100)*

Industry	Average production	1941		1942		
		Civilian portion	War portion	Estimated production	Civilian portion	War portion

"LOVE'S LABOR LOST." A cartoon of 1942 by Carlisle of the *Des Moines Register*, pointing out the futility of attempting to control prices while raising wages

Sugar and Gasoline.—Rationing of sugar and gasoline in 1942 was based not on a shortage of supplies, but on difficulties of distribution. Sugar stocks in refineries, which in July 1941 had exceeded 600,000 tons, dropped to 200,000 tons at the beginning of 1942, approximately the level of 1938. Following the order of the War Production board to divert 500,000 tons to alcohol production, the beet-sugar growers planted 24% greater acreage than in 1941, while Cuban and Puerto Rican supplies increased despite shipping losses. With the increased farm planting of cane, sorghum and kalo crops, the alcohol demand for sugar decreased and stocks of refined sugar increased. Subsequently the Office of Price Administration permitted the ration exemption of sugar needed for the first processing of fruits. On the whole, sugar coupon rationing worked smoothly throughout the U.S. (*See* also SUGAR.)

The U.S. supply of finished gasoline stocks reached an all-time peak in the first quarter of 1942. Produced as a joint product with high-octane gasoline for aviation use and with decreased demand for gas by car owners, the gas reserves increased; but transportation difficulties caused an acute shortage in the fourth quarter along the east coast. Severely felt were the losses in transportation of transoceanic supplies, needed by the armed forces. Railroad tank cars did not exist in sufficient numbers to relieve the east coast shortage, so that gas sales were prohibited for four days in December primarily to accumulate adequate supplies for the north African forces. During 1942 pipe-line construction to the eastern states was begun and barge transportation on the Ohio vastly increased. (*See* also PETROLEUM.)

Fuel Oil.—At no point in the whole U.S. rationing scheme did greater public remonstrance arise than in the rationing of fuel oil. On Oct. 1 the War Production board ordered fuel rationing for 17 eastern states and 13 midwestern states, reducing annual consumption on the average about 25%. Conversion of fuel-oil burners was expected to save 15,000,000 gal. annually. Each coupon was assigned an original value of ten gal., but since the mean average temperature between Oct. 1 and Dec. 31 was approximately 38% lower than the 20-year average, an increase of 10% in the value of each coupon was authorized. So great were the visible supplies, however, that considerable opposition arose in those states having an exportable surplus of oil and the entire administration of coupon rationing of consumers' goods met with mounting public criticism.

Coffee.—Coffee rationing started Nov. 28 with a 38% reduction of the previous five-year average consumption period. Again, rationing was not caused by shortage of total supply but by difficulties in distribution and by excessive consumer hoarding. Dehydration of coffee before import was increased and promised to afford substantial additions to supplies by economizing transport space. Those who entered the armed forces and those who left the U.S. for more than 30 days were ordered to turn in their war ration books to local rationing boards to prevent their misuse. (*See* also COFFEE; RATIONING.)

Manpower Problem.—The problem of critical shortages applied to manpower as well as to raw materials and consumers' goods. Perceiving industrial mobilization for mechanized warfare as equal in importance to military mobilization, the president, on Jan. 12, 1942, created a 12-man War Labor board (*q.v.*) to deal with labour problems growing out of war production. The president stated that "it is not that we do not have enough people in this country to do the job, but the problem is to have the right numbers of the right people in the right places at the right time." In April the War Manpower commission was established "to assure the most effective mobilization and maximum utilization of the nation's manpower in the prosecution of the war."

Among the chief causes of the lack of manpower were voluntary enlistment, drafting of men for military service, labour pirating, absenteeism, 40-hr. week, labour migration, inadaptability of specialized skills, excessive military training periods, strikes and uncertainty of military manpower needs. (*See* also WAR MANPOWER COMMISSION.)

Concentration Problem.—Concentration was applied to the production of bicycles, stoves, typewriters and farm equipment for experimental purposes, and the War Production board planned later in 1942 to extend this principle by "two or three" added orders. The output of farm machinery and equipment was concentrated largely in the smaller factories and with intermediate producers under a production quota arrangement, so that larger producers were relieved for war orders. Production cuts of 50% accompanied this concentration order. Quotas were allotted on the basis of three classifications according to size, and were held to 20% of the 1940 production in the case of new machinery, but expanded to 130% for repairs and replacement.

The principle of concentration was first applied to the stove industry. In this industry, if all plants had been uniformly curtailed, none would have received more than 25% of the steel formerly used, but by concentration in smaller plants the latter were allowed from 50% to 75% of the steel they formerly processed. Final decisions concerning the suitability of the industry for concentration were left to the War Production board upon consultation with both labour and management, while industrial concentration committees decided which plants would discontinue production. No solution for the fate of closed plants was forthcoming in 1942; the War Production board contended this problem was outside its jurisdiction.

Standardization and simplification accompanied concentration. The Office of Price Administration (*q.v.*) made many sweeping changes in the number of products that industries could turn out.

"WHAT PRICE CEILING?" Russell's appraisal in the *Los Angeles Times* o U.S. labour's demands for higher wages before congress passed the anti-inflatio bill Oct. 2, 1942

Two typical examples of this policy were the reduction from 27,000 to 3,000 items in builders' hardware and from 450 to 2 items in the enamelware industry.

Contract Renegotiation Problem.—When the Sixth Supplemental National Defense Appropriation bill was before the hous in March 1942, the Case amendment was passed limiting wa profits to 6% after taxes. Because industrial conversions ha taken place so abruptly, many manufacturers had no preceden upon which to rely in determining accurately the unit costs o production for contracts in which cost-plus was not used. Estimates, intended to be conservative, proved after production ha once begun to have been excessively high. In order to take th profits out of war, and, from the viewpoint of the manufacturers in order not to penalize the governmental war effort, many firm willingly entered into the renegotiation of contracts upon th basis of unit costs determined from experience.

Each contractor in renegotiation proceedings considered hi most recent contract as forcing upon him the tax liability imposed by an extremely progressive excess-profits tax. So the wa department considered almost every contract as coming withi the excess-profits tax brackets, and hence was compelled to allow about 30% net profit before taxes in order to obtain a 6% ne profit after taxes. Renegotiation introduced into government contracts an element of uncertainty, since uniform standards for th determination of excessive profits were lacking, revisions too place at the expense of the contractor, uncertainty dominated hi corporate financial position, and producers' concessions were influenced by varying degrees of patriotism. Although designe originally as a temporary expedient to supplement the normal work of the budget bureau in careful contract supervisions which had become impossible as a wartime procedure, renegotiation proved to be exceptionally advantageous from the public point of view. The Office of War Information announced in Dec. 1942 that about $523,000,000 had been saved on navy contracts alone, with about $122,000,000 secured by refunds and $401,000,000 by price reductions.

Industrial Groups.—*Railroad Transportation.*—Transportation shortage was a serious bottleneck for U.S. production in 1942. Submarine warfare was predicated on the assumption that the railroads could not supply the industries of the east with fuel oil and coal essential to war plants, but the railroads won this battle. The most efficient use in railroad history was made of rolling stock, trackage and terminal facilities. Boxcars moved farther and faster and carried heavier loads. Except for tank cars, one-way traffic was reduced to a minimum. Boxcar storage was almost eliminated, high-speed freight abolished, passenger schedules slowed down, cross hauls reduced, unused lines scrapped and their rails moved to places of acute need.

The index of freight car loadings (Table I) shows that the amount of freight carried had doubled since the war began, but fails to show the increase in average load and length of haul. Although freight car loadings were up 51% above the 1935–39 average, ton miles had increased 221%. Ton mileage for all Class I roads amounted to about 630,000,000,000 tons for 1942, compared to the peak of 447,000,000,000 tons in 1929. Cost per ton mile dropped to six mills, the lowest in railroad history, primarily because the largest type of freight shipments, like coal and ores, were hauled great distances. (*See* also RAILROADS.)

Automobile Transportation.—On Jan. 1 the Office of Price Administration froze the retail sale of automobiles; on March 20 gas sales were reduced 20% in 17 eastern states, Oregon and Washington; on May 12 all motorists in those states registered for gas coupons allowing them at first 4, then 3.8 and later 3 gal. per coupon. The Baruch committee reported on Sept. 10 in favour of nation-wide gas rationing, a national speed limit of 35 m.p.h., a national scrap drive for rubber, and the appointment of a rubber czar. On Dec. 1 gas rationing became nation-wide. (*See* also AUTOMOBILE INDUSTRY IN THE WAR.)

Bus Transportation.—Because of the unsatisfactory results of special rationing the Office of Defense Transportation (*q.v.*) on Nov. 15, 1942 required all commercial carriers to be covered by a "Certificate of Necessity" before they could obtain gas, tires, equipment and repairs. These certificates limited mileage, minimum loads, and required periodic inspection. Intercity traffic dropped about 40%, but traffic within cities rose abruptly after compulsory gas rationing. (*See* also MOTOR TRANSPORTATION.)

Building.—The year witnessed a rapid drop in private and a still more rapid increase in public construction. The department of commerce estimated that $13,500,000,000 were spent for new buildings in 1942 compared with the peak of $11,000,000,000 in 1941. In Nov. 1942 public projects for military establishments accounted for 90% of the month's building activities. For the year as a whole military and naval building more than doubled that of the preparedness year of 1941, factory construction rose 80% while new private building dropped 66% from the first to third quarters and was estimated to be 90% less in the fourth quarter. (*See* also BUILDING INDUSTRY; HOUSING.)

Company Earnings.—The quarterly earnings and dividends of the 629 industrial companies reporting to the Federal Reserve board were distinctly less favourable in 1942 than in 1941, despite exceptionally large output and favourable market prices. For the first nine months of 1942 these corporations reported a net profit of $1,252,000,000 as compared with $1,620,000,000 for the corresponding period of 1941. Operating revenues for the first three-quarters for Class I railroads rose from $3,892,000,000 in 1941 to $5,327,000,000 in 1942, an increase of about 37%. Railroad dividends for the same period, however, rose from $89,000,000 to $98,000,000, or about 10%. The electric power utilities experienced a rise in operating revenue from $588,000,000 in 1941 to $626,000,000 in 1942, an increase of about 7%, but their quarterly dividends dropped from $60,000,000 in 1941 to $57,000,000 in 1942—a reflection of the increased tax burden. The net profits, after all charges and taxes, but before dividends, for the 629 corporations fell from $867,000,000 in 1941 to $593,000,000 in 1942, or about 24%.

Wholesale and Retail Trade.—During the 12-year period from 1929 through 1940, about 56% of all individual income was spent in the retail trades. During the first seven months of 1942 retail sales equalled 65% of total national income. Rising prices accounted for about one-fourth while volume of goods sold represented about three-fourths of the increase in retail sales. Causes of this rise in retail trade were, chiefly, mounting wages, record farm net incomes, fear of inflation and future shortages, and the anticipation of higher future incomes. When the Office of Price Administration fixed the ceiling prices after May 18, 1942, at the March level, mark-ups had already taken place in many commodities in both wholesale and retail trades. For example, in the textile and apparel lines, which constituted as much as 75% of department and variety store sales, the ceiling prices were as much as 10% to 15% below replacement costs, and this difference, which was called the retail "squeeze," was to be "rolled back" upon wholesalers and manufacturers. Part of the squeeze was borne by decreasing the quality and quantity of raw material; part, by subsidies to high-cost producers; and part by reduction of services. Trends in retail sales are shown in Table III.

The retail establishments that felt the pinch of shrinking inventories most acutely in 1942 included automobiles, household appliances and radios, heating and plumbing, paint, electrical supplies, lumber and building materials, farm implements, filling stations, shoes, clothing and variety stores. By October many factories held unfilled orders for durable goods that could have kept them running at current rates of production for eight months.

Chain store sales were substantially in excess of the record year of 1941. Variety chain store sales for 1941 ranged within an index of 110 for January to 125 for September; corresponding sales for 1942 rose from 127 in April to 144 in October. Likewise grocery chains whose sales index for 1941 varied from 128 to 159 in December, opened in Jan. 1942 at a level of 176, dropped to 168 in March—well above the high of 1941—and rebounded to 175 in August. The drug store chains showed less advance but secured a 15% increase in monthly average sales for the first ten months. Retail dollar sales of mail-order houses ran below those of 1941. Gains made in the first quarter were not retained, and for the first 11 months the two largest houses showed gains of only 1% and 6% over 1941.

Cost of Living.—The average cost of living for 1942 was 20% higher than in 1939, the year of the outbreak of World War II.

U.S. Department of Commerce.

By 1941 the dangers of inflation became apparent when the government established the Office of Price Administration and Civilian Supply. Pursuant to the First War Powers act of 1941, the president established on Jan. 16, the Office for Emergency Management (*q.v.*) to "exercise general jurisdiction over the war procurement and production program." Following also in January came the Emergency Price Control act of 1942, which enacted the most inclusive regulation of business ever passed by a U.S. congress.

The expressed purposes of the Price Control act were to prevent price and credit inflation, to prevent speculation and increased rents, to prevent labour disturbances and interferences with war production, to eliminate war profiteering and hoarding, to prevent dissipation of defense appropriations by increased war costs, to protect people living on fixed incomes, to prevent a postwar collapse of business, to protect the cost of living, and to stabilize purchasing power.

On April 28 the Office of Price Administration froze the prices of the bulk of the items entering into the cost of living by establishing the highest selling price during March as the ceiling for retail, wholesale, and manufacturing prices, and issued the general maximum price regulation as a wartime measure to apply for the "duration."

Manufacturers and wholesalers were expected to support retail price ceilings. Whenever retail prices of March were lower than wholesale prices of May, the so-called "squeeze" was rolled back upon the wholesalers and primary producers, and only in the case of special hardships did the Office of Price Administration undertake necessary adjustments. The regulations became effective on May 18, 1942. On July 1 every retailer was required to file with his local War Price and Rationing board a "statement showing his maximum prices for all cost-of-living commodities offered for sale in his store," and to display price ceilings of all goods sold.

Special administrative difficulties arose for seasonal summer goods that were not sold in March; for goods that were newly produced and for which cost data were not available in May; for goods having substitutes readily available; for goods in which lowered qualities were imperceptible to customers; for goods in which special services such as returns and repairs were involved; for goods for which geographical quality and customer differentials were ordinarily allowed; and for those farm products which had been expressly excluded by congress. Exceptional difficulty was encountered in the price fixing of commodities produced under conditions of joint cost. Detailed specifications, designed to check evasion and violation in the orders issued by the Office of Price Administration, resulted in confusing legal complexities for business management. On the whole, however, business showed that "patience itself is good patriotism."

President Roosevelt presented to congress on April 27, 1942, a seven-point national economic policy to control the cost of living by: (1) heavy taxes on excess profits; (2) price and rent ceilings; (3) wage stabilization; (4) stabilization of prices of farm products; (5) purchase of war bonds instead of nonessential goods; (6) rationing of essential goods; and (7) discouragement of instalment buying.

Wages and expressly exempted farm prices became the focal point in costs. Powerful labour unions opposed wage ceilings, and equally powerful farm groups opposed farm price ceilings that violated existing farm parity prices. Factory pay rolls for 1942 were more than three times as large as those of 1939, and rising farm prices brought farm cash income to a level 80% higher than in 1939, so that by the end of 1942, wage costs had become a more powerful factor in augmenting the cost of living than food costs. The average wage income in industry was $1,203 (100) in 1939, $1,268 (105) in 1940, $1,484 (123) in 1941, and was estimated at $1,766 (146) in 1942. The average income per worker engaged in agriculture was $498 (100) in 1939, $527 (105) in 1940, $742 (148) in 1941, and was estimated at $1,052 (212) in 1942. Repeatedly the Office of Price Administration pointed with alarm to the spiralling wage and food costs menacing the effectiveness of price controls.

The Emergency Price Control act on Oct. 2, 1942 amended the former law by providing for the stabilization of wages and farm prices, by checking the pressure of wages and food costs on supply, and by checking their effects on demand and excessive spending. The day following, the president named a director of economic stabilization, and on Dec. 6 made the secretary of agriculture the food czar.

The director of economic stabilization was ordered to formulate a comprehensive national economic policy to prevent avoidable increases in the cost of living, to reduce unnecessary migration of labourers from one industry to another, and to facilitate the prosecution of the war. Complying with this order, a maximum of $25,000, after taxes, was set as the ceiling for salaries; the functions of the National War Labor board were extended to all industries and all employees; changes in wage rates were prevented unless authorized by that board, which froze wage rates at the level prevailing on Sept. 15 and prevented salary increases in excess of $5,000 except when in conformity with increased responsibilities; and heavy penalties were to be imposed whenever wage and salary increases violated these orders.

The bureau of labour statistics weights food 33.9%, clothing 10.5%, housing 18.1%, fuel and light 6.4%, house furnishings 4.2%, and miscellaneous 26.9% in computing the cost of living. The monthly trends in these items for the first three-quarters of 1942 are shown in Table IV.

Despite the fall of the domestic purchasing power of the dollar, the mounting cost of living was more than equalled by increased incomes in the hands of the consuming public. According to estimates of the U.S. department of commerce the total national income for 1942 was about $117,000,000,000, compared with about $94,000,000,000 for 1941. Approximately $80,000,000,000 was paid out in wages and salaries compared with $61,000,000,000 in 1941. If the $17,000,000,000 paid for federal taxes plus the

U.S. Bureau of Labor Statistics.

$9,000,000,000 paid as state and local taxes are considered as fixed charges on the national dividend there still remained about $100,000,000,000 for consumers' expenditures. But this picture became inadequate in times when war production of the nation consumed about 50% of total productive capacity, since war goods do not raise standards of living, but are designed to protect it.

The trend in income payments, wholesale prices, pay rolls, factory employment, farm price ratios and prices of farm products, portrays a more precise explanation of the incomes used to defray rising costs of living. The data in Table V are combined from reports of the bureau of labour statistics, the Federal Reserve board and the bureau of agricultural economics and indicate the relative significance of incomes and food costs in the cost of living.

Table V.—*Trends in U.S. Income, Prices, Pay Rolls, Employment and Farm Prices*

Month	Income payments (value) 1935–39 = 100	Wholesale prices 1926 = 100	Pay rolls 1923–25 = 100	Factory employment 1923–25 = 100	Ratio of farm prices received to prices paid	Prices of farm products

Nov.	—	100.1	—	—	109	169

Labour resisted wage ceilings partly because of lack of governmental control of farm prices and partly because of lack of profit control. The answer to profit control came in the revenue act of 1942, which added $7,000,000,000 to federal taxes for 1943 plus a 5% victory income tax on all incomes over $624 per year.

On Oct. 2 temporary maximum prices were set for various foods, including butter, cheese, eggs, poultry, mutton, flour, beans, onions, potatoes, citrus fruits, and canned and dried milk products. Fresh vegetables, apples and fish were the chief foods exempted from price control. (*See* also PRICES; WAGES AND HOURS.)

Securities.—Corporation bond indexes for 1942 were relatively few points removed from the levels of 1941. Closing figures for the Dow-Jones combined index of 40 representative industrial issues on Dec. 24 was 90.14 compared with the closing figure of 88 for 1941.

Corporate stock during the year became classified by the market into war, peace and "straddle" stocks. During the first quarter, with Allied reverses, war stocks rose and peace stocks fell, while the outlook for taxes on corporate incomes appeared especially dismal. With increasing Russian resistance and a check to Japanese advances in the Pacific during the summer of 1942, peace stocks rose and war stocks fell, but all types tended upward as discussions of inflation became more widespread. During the third quarter, with improved outlook for peace, rapid expansion in bank deposits, tax concessions on corporate incomes by congress, and lowered tax reserve requirements, the stock market reflected growing confidence, despite the decline in war stocks. (*See* also STOCKS AND BONDS.)

About seven-eighths of all new plant and war facilities constructed during the year had been financed by the Reconstruction Finance corporation (*q.v.*) and its subsidiaries. This involved the construction, equipment and expansion of 1,337 plants engaged in the manufacture of ships; bombing, fighting, transport and cargo planes; tanks, heavy guns and ordnance; magnesium; aluminum; steel; tin; copper; aviation gasoline; machine tools; pipe lines and other less vital industries, at a cost aggregating about $8,300,000,000.

Banking.—In Dec. 1940 money in circulation amounted to $8,500,000,000; in Dec. 1941, $10,600,000,000; and in Dec. 1942, $15,300,000,000. This astonishing increase may be accounted for by the expansion of the wage earners' share of the national income to almost 80%; by the great increase in the number of wage earners who had made no banking connection since the depression and who retained their savings in the form of cash; by the rise in consumer prices that demanded more pocket and purse money; and by the fear of uncertainties in business and banks that accompany war alarms. The entire increase in the circulating medium was in the form of federal reserve notes, since gold and silver certificates outstanding remained about the same, while national and federal reserve bank notes declined.

The total excess reserves of all member banks of the federal reserve system in Jan. 1942 was $3,500,000,000—about half of the peak of $7,000,000,000 in Jan. 1941. The low point for the year was reached late in September, when credit expansion had reduced excess reserves to $1,700,000,000 followed by a year-end rebound to about $2,500,000,000. The volume of discounts continued to be relatively small despite the lowering of rediscount rates in the fourth quarter. Bank borrowings from federal reserve banks on any great scale had become unnecessary so long as excess reserves were well above legal minimum requirements, and member banks were in an exceptionally liquid position with their huge purchases of governmental securities which they could promptly sell to the federal reserve banks.

Commercial banks gradually augmented their holdings of U.S. securities until the third quarter, when an added $6,000,000,000 was purchased, of which about one-half was absorbed by the New York city banks, chiefly in the form of treasury bills. In December the treasury floated a $12,000,000,000 loan with private investors taking about 60%. Bank deposits continued to rise with the governmental spending of the proceeds of these loans and the redeposit by corporations and individuals. (*See* also BANKING.)

Bankruptcy.—War adjustments had inflicted heavy penalties on small businesses, and the senate small business committee reported as late as Sept. 1942 that while not a single government agency had been able to supply reliable data on mortality trends of small plants, it was estimated that about 300,000 had closed on account of war conditions, while only 9,414 firms closed because of bankruptcy. The monthly average shown by Dun's insolvency index was the lowest in six years. Apparently the rate of failures was about 46.2 for each 10,000 enterprises, compared with 54.4 in 1941. The highest number of failures in 1942 occurred in March, the lowest in September. One-fifth of all failures in October occurred in food and liquor businesses, one-eighth in eating and drinking establishments, two-thirds in retail trades, and only one-sixth in mining and manufacturing. Larger firms evidently found it less difficult to adjust to war markets, since only one of the firms going into bankruptcy had liabilities in excess of $1,000,000, while 54% had liabilities under $5,000, and 38% had liabilities between $5,000 and $25,000.

Legislation Affecting Business.—Pursuant to the First and

Second War Powers acts, the Price Control act, Appropriation acts and other special legislation, the president established such agencies as the Office for Emergency Management, War Production board, War Manpower commission, Office of Alien Property Custodian, Defense Communications board, National War Labor board, Office of the Coordinator of Inter-American Affairs, Office of War Information, Office of Lend-Lease Administration, Office of Defense Transportation, Office of Civilian Defense, and War Shipping board. The activities of each of these agencies exercised varying controls over business and industry in 1942, because of the conviction that victory in modern war depends vitally upon economic strength expressed in terms of production, finance and consumption. At the same time such regular agencies of the government as the war, navy, and interior departments increased activities that affected industry both favourably and adversely, and perhaps most of all, the treasury through its recommendations of fiscal planning for total war, endorsed by congressional assent, modified the normal operations of the U.S. economy.

Business was loaded with responsibility for a multitude of questionnaires, reports and tax returns. The questionnaires issued by the War Production board alone required every manufacturer to fill out 512 ft. of reports during 1942 relating to priorities, allocations, federal assistance, inventories, wages, hours and social security payments. Legal fees, accountants' stipends, expert opinion for filling out forms became a sort of new tax on business.

Not only did regulation of business expand but taxation dipped deeper into pockets and tills than ever before in U.S. history. The Revenue act of 1942 relied chiefly upon direct taxes on individuals and corporations, with individuals contributing about $6,100,000,000 more than heretofore, including $3,000,000,000 for victory taxes having postwar refunds estimated at $1,100,000,000. Corporate taxes were increased about $1,800,000,000 with postwar rebates of $550,000,000, while indirect excise taxes were raised about $650,000,000. Even with such a tax increase there was ample reason to conclude that the use of taxes for anti-inflationary purposes had not been adequately augmented. (*See* also LAW; TAXATION.)

U.S. Foreign Trade.—War considerations dominated foreign trade in 1942. For the 12 months ending Nov. 30, lend-lease aid totalled $6,526,000,000. From the beginning of the program on March 11, 1941 to Nov. 30, 1942 the dollar value of goods transferred and services rendered reached a total of $7,496,000,000. During Oct. 1942, about 40% of lend-lease exports were sent to the United Kingdom, 39% to the middle and far east and about 21% to Russia.

The three leading types of merchandise exports were military supplies, industrial products and foodstuffs. The total export value of military supplies rose sharply but the exact figures for specific items were not available in 1942. Nevertheless it was known that the total monthly lend-lease exports had increased sixfold over those of 1941, while military supplies had risen fourteenfold. Relatively, the volume of food and industrial items had substantially diminished, but the dollar value had risen about 22%.

Services rendered accounted for about 22% of the total lend-lease aid, or $1,642,000,000. Of these invisible items of trade, approximately 50% had been used for shipping and supply services, air ferry routes, ship rentals, supply bases and the labour necessary to erect docks, warehouses, supply depots, and harbours. Another 15% was spent in domestic shipyards for services to repair hundreds of damaged Allied merchant and naval vessels. The remaining 35% represented outlays for production facilities such as factories and shipyards built to produce certain types of lend-lease items. (*See* also INTERNATIONAL TRADE; LEND-LEASE ADMINISTRATION, OFFICE OF.)

Table VI shows the month-by-month trend in U.S. merchandis export and import values for 1941 and 1942.

*Preliminary figures. Federal Reserve *Bulletin*.

Business Conditions in Other Countries.—*Great Britain.*—The *London Economist* index of wholesale prices of all commodities registered 156 in Jan. 1942 and rose to 160 by October, whil the index of retail food prices for the same period dropped from 163 to 162. The cost-of-living index opened in January and closed in October at exactly 200, although monthly variations were recorded.

Company earnings for 474 industrial companies rose about 2% for the first three-quarters. For the first half-year profits had been "bumping along the bottom" because companies were building up reserves for taxes, but larger allotments of net profits wer made for dividends during the third quarter after the busines tax-reserve policy had been stabilized. The most favourable showing was made in the consumption trades, the poorest, in rubbe and shipping. From the beginning of 1941 company profits had dropped each successive quarter until a reversal of the trend in the third quarter of 1942.

Industrial share prices moved upward and bond prices held about the same level during the year. *The Financial News* index of 30 industrial shares, based on July 1, 1935 as 100, registered 9 at the close of 1942 compared with 77.5 at the beginning of the war. The year's low of 66.5 was reached in April 1942—about the same time as the low in the New York market. By way of contrast, the bond index, based on 1928 as 100, closed the year at 134.2, at about the year's opening level of 134.4.

Five types of rationing had developed. (1) Differential rationing was established to meet the special needs of invalids, persons suffering from particular diseases, vegetarians, women and children and certain classes of workers. (2) Ordinary rationing, resembling the U.S. procedure of sugar and coffee rationing, provided a fixed quantity for stated periods, usually one month (3) Group rationing was based on a fixed amount in portions of groups of foods such as jams, jellies, and syrups, or butter and margarine. (4) Point rationing applied wherever foods could not be separately rationed because of changing supplies, like canned foods, so that each consumer was allotted 20 points every four weeks, the point value varying with the scarcity of the food (5) Registration rationing was required for certain foods, the Food Minister announcing the minimum to be distributed, thus allowing flexibility for surplus foods.

Britain devised three controls of war production of primary significance. After the outbreak of the war in 1939, "limitation controls" were imposed upon the total amount of raw materials used for civilian production. This was supplemented in March 1941 by "concentration of production" in which a few factories were chosen and assigned quotas of the closing firms. By July 1942 concentration had released about 250,000 workers and 55,000 sq.ft. of factory floor space for war production. A third system, known as the standardized price "utility" control, was instituted in Feb. 1942. It was first applied to the clothing industry with about 2,000 of the 25,000 firms in this field selected to produce standard fixed-price garments; in June it was extended to the soft drink business, and in August to furniture, releasing 30,000 more workers. Production of certain goods that could not be standardized such as cash registers, lawnmowers, toys, games, trunks, certain kinds of leather goods and jewellery, was prohibited.

The Oxford Institute of Statistics estimated that between Oct. 1938 and Oct. 1942 the average gross earnings of workers rose 56%, of which 32% was the result of higher wages and 24% of longer hours, while increased income taxes trimmed this gain to 40%.

Germany.—Information related to industrial and commercial developments in Germany during 1942 was coloured by war propaganda and therefore unreliable. For example, the official figures of wholesale prices showed that the index stood at 114 in January and six months later at 115, evidence of the "price-stop" system, which concealed the maximum and minimum prices and state subsidies for a wide variety of goods. The wage system was vitiated by importation of prisoners of war into vital war industries only at food and shelter costs. The adoption of the Speer plan in September, whereby every man was called to the front regardless of his industrial worth, indicated a manpower shortage in the army and led to one in industry.

France.—Original nazi "collaboration" plans called for the de-industrialization of France and the restoration of specialized agriculture, but in 1941 this plan was modified to make France a "subsidiary arsenal" because the area was presumably bombproof. Private orders with French industrialists amounted to 100,000,000,000 marks by April, but in July the chief of the German War Economic administration in France declared that the placing of contracts "had passed its zenith" and expressed dissatisfaction with the collaboration policy. After July industrial orders in France dropped, but war orders for airfield equipment and cement fortifications rose. By the middle of August about 4,000 factories had closed for want of raw materials or labour. In September a German order closed all factories unless 75% of the orders came from Germany. Failure of the collaboration policy led to a resumption of the de-industrialization policy.

Italy.—Collaboration in 1942 took the form of exports to Germany of silk, rayon, sulphur, mercury, hemp and bauxite, and in return Italy demanded iron and steel—two of Germany's most precious sinews of war. The wartime fascist policy called for the furtherance of Italian self-sufficiency, and the industrial development of Genoa, Turin and Milan depended largely on iron imports. This did not accord with nazi plans for the de-industrialization of Italy, whereupon efforts to improve agriculture met with both fascist and nazi support. Amalgamation took place in the dye, textile and electrical industries of Italy, whose industrialists feared German alliance and domination because they were potential competitors of those German industries. Italian industrial ambitions received severe setbacks with the bombing of the Caproni, Fiat and Ansaldo works—the leading arsenals of Italy.

Canada.—The year 1942 began with the virtual pooling of the productive resources of Canada and the U.S. when President Roosevelt announced in Dec. 1941 that wartime collaboration with Canada required the removal of tariff barriers for free flow of war supplies. Upon U.S. entry into the war, Canada could no longer call upon its neighbour for war supplies and hence was compelled to contract her economy in other directions. By February, Canada had an armed force of 500,000, with 150,000 already overseas, and had spent $600,000,000 on war plant construction.

Methods of Canadian price control proved so effective that they influenced U.S. price policy in 1942. In the four months ending March 1942, the Canadian price index advanced but 1%, while for the same period wholesale prices in the U.S. rose 6%. The Canadian cost of living index also remained practically unchanged. The manpower crisis was reached in October, when 5,500,000 or about half the population were engaged in war work or in the armed services.

On Nov. 1 business was frozen by the general order prohibiting the creation of new business outlets, moving to larger premises, and adopting new lines of trade except by special permit from the dominion government. That order applied to all manufacturers, wholesalers and retailers and ten service trades. On Oct. 6 the Wartime Prices and Trade board decreed that distribution of goods should follow certain requirements; that retailers might buy in the same proportions as in 1941; that no new retail customers for scarce lines could be accepted by wholesalers except at the request of the administration; that the manufacturers' or wholesalers' own retail stores could not be given preference; and that areas with greatly increased population were to be given special treatment. (E. H. He.)

Butter.

Civilian consumption of butter in the United States was to be reduced from 16 lb. per capita in 1942 to 13 lb. per capita in 1943, Food Administrator Claude R. Wickard predicted Jan. 5, 1943, at which time he announced an order reserving for military use 30% of all butter produced in the United States after Feb. 1, 1943. Previously, to meet immediate lend-lease needs, the government on Nov. 20, 1942, froze until March 6, 1943, 50% of the supply of cold storage butter in the 35 principal storage markets, representing about 75% of the cold storage supply. Regardless of existing contracts, holders of storage butter were prohibited from delivering butter except by specific permission of the WPB or for delivery to the armed forces, to lend-lease or other specified government agencies. Later it was revealed the government acquired only about 18,000,000 lb. of butter by this impounding order, an amount sufficient to meet war requirements for only two weeks. But for the order, however, it was estimated that storage stocks would have approached zero by Dec. 1942. The cold storage supply of butter Jan. 1, 1943, was 25,104,000 lb., the lowest since Jan. 1933, and the second lowest on record. Stocks in storage Jan. 1, 1942, were 114,436,000 lb., and the five-year (1938–42) average for that date was 76,624,000 lb. Butter stocks of May 1, 1942, were 70% above those of May 1, 1941, and production at the same approximate rate as that of 1941 seemed ample for all domestic needs. Increased civilian consumption, a 3% decline in butter production during the last half of 1942, and a growing demand for military and lend-lease supplies made it apparent in the autumn of 1942 that curtailment of home butter supplies was impending. Butter prices had averaged around 40 cents in the first half of 1942. In Nov. 1942, to encourage production, the government announced it would support butter prices at 46 cents per lb. for 92 score butter, Chicago basis, through June 1944. Although possible rationing of butter was rumoured frequently late in 1942, no formal order was issued. Retailers, however, quite generally adopted a policy of limiting purchases in order to conserve the supply.

It was estimated that the government order reserving 30% of all butter produced after Feb. 1, 1943, would set aside 510,000,000 lb., of which more than two-thirds would be sent to United States military forces. Most of the remainder, Secretary Wickard said, would go to Russian armies. This left for civilian use in 1943 an estimated 1,910,000,000 lb. Since the government had agreed to pay fixed prices for butter throughout 1943, the possibility arose that the government would also have to store the civilian supply as well as the military and lend-lease supply. With prices fixed, there could be no margin that would enable private interests to buy butter at lower prices during the months of surplus production and store it for higher prices during the months of low production. (S. O. R.)

Byrnes, James F.

(1879–), U.S. jurist, was born May 2 in Charleston, S.C., of Irish parentage. At the age of 14 he left school to become office boy of a law firm. By studying stenography, he advanced to the position of court reporter. In 1910, he was elected to the house of representatives on the Democratic ticket and was re-elected six times, serving from 1911 to 1925. As a member of the deficiency committee during World War I, he formed a lasting friendship with Franklin D. Roosevelt, then an assistant secretary of the navy. In 1930 he was elected to the U.S. senate and was re-elected in 1936. In June 1941 he was appointed associate justice of the U.S. supreme court. After serving 16 months on the supreme court bench, he was named by President Roosevelt to head the newly created Office of Economic Stabilization on Oct. 3, 1942. Byrnes, who had helped frame the amended emergency price control act of 1942, was familiar with his new tasks, which were to formulate a national policy covering profits and prices, wages and rentals, and rationing and subsidies. President Roosevelt on Dec. 15 widened Byrnes' power by authorizing him to act as mediator in disputes arising over the administration of food supplies.

Cabinet Members.

The following members of President Roosevelt's cabinet held office on Jan. 1, 1943:

Post	*Name*	*State*
Secretary of State	Cordell Hull	Tennessee
Secretary of the Treasury	Henry Morgenthau, Jr.	New York
Secretary of War	Henry L. Stimson	New York
Attorney-General	Francis Biddle	Pennsylvania
Postmaster General	Frank C. Walker	Pennsylvania
Secretary of the Navy	Frank Knox	Illinois
Secretary of the Interior	Harold L. Ickes	Illinois
Secretary of Agriculture	Claude R. Wickard	Indiana
Secretary of Commerce	Jesse H. Jones	Texas
Secretary of Labor	Frances Perkins	New York

Great Britain.—At the close of 1942 the war cabinet was composed as follows:

Post	*Name*	*Party*
Prime Minister, First Lord of the Treasury and Minister of Defense	Winston Churchill	Conservative
Secretary of State for Dominion Affairs and Deputy Prime Minister	C. R. Attlee	Labour
Lord President of the Council	Sir John Anderson	Conservative
Secretary of State for Foreign Affairs	Anthony Eden	Conservative
Home Secretary and Minister of Home Security	Herbert Morrison	Labour
Minister of Labour and National Service	Ernest Bevin	Labour
Minister of Production	Oliver Lyttelton	Conservative
Minister of State (Cairo)	R. G. Casey	(from Australia)

For other ministers and members of the government, *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

Cacao: *see* COCOA.

Cadmium.

Primary cadmium production in the United States in 1941 increased 14% over 1940, to 6,937,900 lb., while shipments totalled 7,368,300 lb., and apparent consumption 7,469,800 lb. In addition, there was a recovery of 245,000 lb. of secondary cadmium in 1940 and 381,000 lb. in 1941. The cadmium content of Mexican flue dusts increased from 815.7 metric tons in 1940 to 906.6 tons in 1941, all of which was shipped to the United States for treatment.

California.

The most southerly Pacific coast state of the United States, frequently called the "Golden state." It was admitted to statehood Sept. 9, 1850. Area 156,803 sq.mi.; pop. (1940) 6,907,387; unofficially estimated at 7,660,000 in 1942. In 1940 only 29% of the pop. was rural. Capital, Sacramento (105,958); other leading cities, Los Angeles (1,504,277); San Francisco (634,536); Oakland (302,163); San Diego (203,341); Long Beach (164,271); Berkeley (85,547); Glendale (82,582); Pasadena (81,864).

History.—California had its first attack of the war when a Japanese submarine shelled oil fields at Ellwood on Feb. 23, 1942 doing little damage. Blackouts in coastal cities took place on several occasions; on Feb. 26 there was anti-aircraft firing in Los Angeles. As a defense measure all Japanese (approx. 95,000) were ordered removed from a coastal zone under date of March 17 by the commander of the western defense area, Lt. Gen. John A. Dewitt; the most important relocation centre was at Manzanar in the Owens river valley. All Japanese were out of the coastal zone by fall. Other defense measures included the dimming of lights visible at sea along the coast on Aug. 5, and later (Oct. 10) a general dimout for a zone extending 50 miles inland.

Greatest interest in the political field centred around the general election in November. The incumbent governor, Culbert L. Olson (Democrat), lost to former Atty. Gen. Earl Warren (Republican) in an election in which 2,264,288 persons cast ballots. Both the lieutenant-governor and the secretary of state chosen were Republicans. The Republicans also won a majority in both houses of the state legislature. The electorate approved an anti-hot cargo initiative measure, and defeated a proposal to repeal the state income tax.

EARL WARREN, Republican governor of California, elected Nov. 3, 1942

The tremendous industrial expansion started in 1940–41 continued in 1942 and taxed housing, educational and health facilities in many areas; San Diego was particularly affected. The last month of the year saw shortages in food supplies, notably of meat, eggs and butter.

Education.—Expenditures for the fiscal year 1940–41 for education were $156,540,303. The average daily attendance was 998,836, and the teaching staff numbered 43,200. Total number of secondary schools (Oct. 1942) was 737. Budget (1941–42): elementary schools $41,903,516; secondary $37,081,738.

Public Welfare, Charities, Correction.—State and county contributions to old age security (Dec. 1942) amounted to $3,966,080 (additional federal contribution $3,148,456); for aid to the indigent blind $185,407 (federal contribution $131,535); for aid to needy children $513,151 (federal contribution $178,607); and for county indigent $411,411. Seven institutions for the insane (normal capacity 20,611 patients) were maintained, also two homes for mental defectives (normal capacity 4,390); three correctional schools (normal capacity 1,154); and one each for adult blind and for narcotic addicts. Three state prisons for men and one for women were in operation.

Finance.—The state budget for the 1941–43 biennium, including special appropriations, was $521,297,039, of which $290,720,244 was to go to local governments for various purposes. Total income for the fiscal year 1941–42 was $345,443,602, 15.3% higher than for 1940–41. The sales tax produced most revenue ($132,576,351), next ranked the motor vehicle fuel taxes and licences ($58,517,778). Other major income sources were: bank and corporation franchise tax $34,065,799; personal income tax $29,038,934; alcohol beverage revenue $17,806,971. All major sources of revenue, except inheritance taxes, horse race revenue, and in lieu taxes increased during the year. The state general fund showed a surplus in Dec. 1942, of approx. $60,000,000. Bonded indebtedness on July 1, 1942, was $147,085,500. Property value in the state (Dec. 1942) was assessed at $7,679,695,000. On July 1, 1942, there were 192 banks, with an additional 847 branches (resources approximately $5,762,286,000; deposits $5,279,200,000).

Communication.—California had in 1940 steam railroads amounting to 14,088 mi.; 2,768 mi. electrified railroad; approximately 900,000 mi. of public highway. Motor vehicles registered in the state Jan.–Oct. 1942, numbered 3,014,247 compared with 3,113,528 for the same period in 1941. Traffic deaths decreased 16.7% in the first 9 months of 1942.

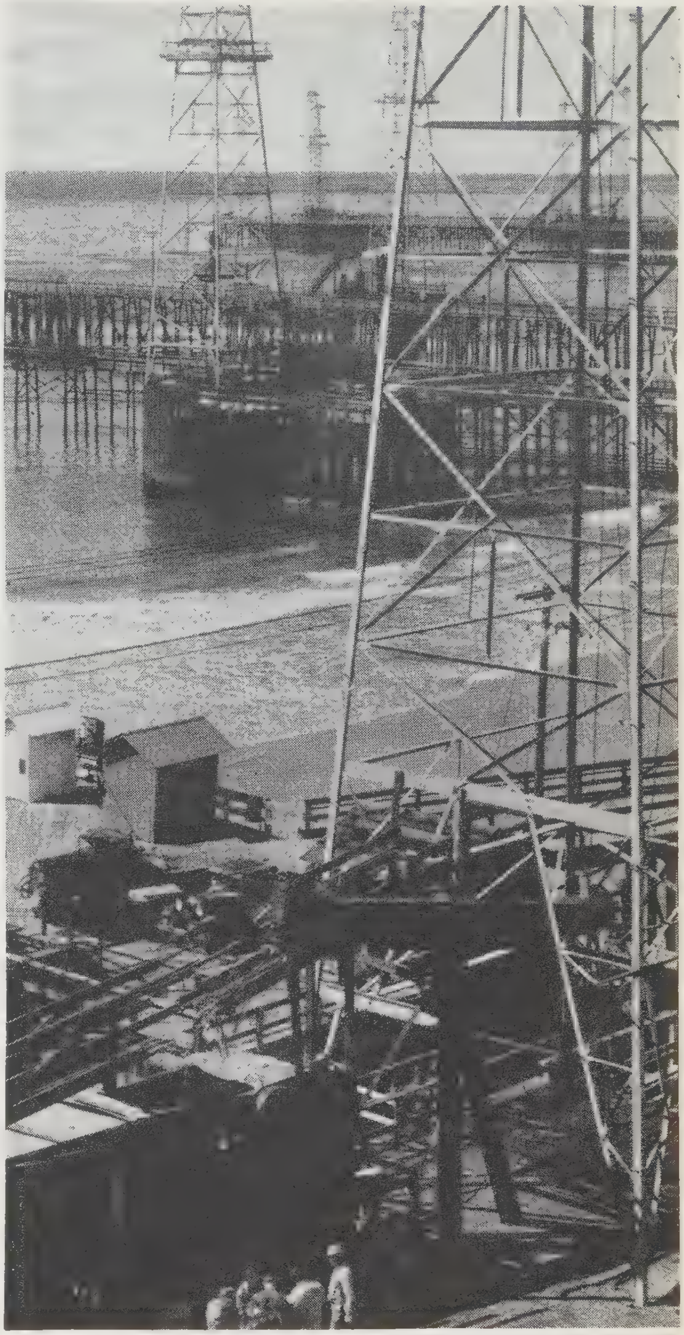
Agriculture.—In 1942 California harvested the greatest crop of fruit and nuts in its history; the total value was estimated at $325,539,000 (30% more than in 1941). Oranges were highest in value at $80,985,000 ($69,087,000 in 1941). Other crop values: grapes $75,857,000; almonds $9,240,000; apples $6,455,000; apricots $14,331,000; avocados $1,879,000; cherries $3,996,000; figs (dried and fresh) $5,150,000; lemons $18,922,000; olives $6,786,000; peaches $25,677,000; pears $14,948,000; prunes $24,360,000; walnuts $16,530,000. The value of agricultural products in the state (1941) amounted to $563,735,000 (fruits and nuts $240,827,000; commercial vegetables $107,047,000; field crops and cotton $215,861,000). Livestock valuation (1941) was $288,253,000.

Manufacturing.—California continued the expansion in production of durable goods started in 1940–41, with shipbuilding and aeroplane construction leading in output. The total number of nonagricultural wage-earners in Nov. 1942 was 2,647,000 as against 2,238,000 in 1941. Employment in durable goods factories (602,000) was nearly double that of the previous year (337,000). In nondurable goods industrial employment there was a slight decline (172,000 in Nov. 1942; 175,000 in 1941). The Los Angeles industrial area employed 389,000 workers, the San Francisco area, 243,000. Average weekly earnings of workers was $48.86 (durable goods industries: $37.10; nondurable: $52.12). In Nov. 1942, 25% of the labour force in the state was made up of women (11% in 1941).

Mineral Production.—The output in 1941 was valued at $367,784,000 (1940 production: $342,825,817). As in the previous year, petroleum accounted for the greatest amount: $220,260,000 for 230,157,000 bbl. (1940: $207,479,800 for 223,294,805 bbl.); natural gas was next, with 363,025,000 M. cu.ft. valued at $21,055,000. Salines and borates output for 1941 was worth $12,200,000; brick (all types) and tile $3,598,797. Cement produced amounted to 19,551,608 bbl. (value $26,248,694).

Principal Metals of California, 1941 and 1940

Product	Value, 1941	Value, 1940
Gold	$49,420,000	$50,948,485
Quicksilver	4,505,916	3,209.754
Tungsten	4,080,628	2,267,135
Silver	527,000	1,678,063
Copper	913,000	1,450,170
Lead	370,000	154,632
Chromite	342,218	32,796
Manganese ore	75,057	3,260



THE FIRST ENEMY SHELLS to fall on U.S. soil in World War II were fired by a Japanese submarine which bombarded the oil fields at Ellwood, Calif., near Santa Barbara, on the evening of Feb. 23, 1942. The only material damage was to the rig and pump house of one well, shown in lower centre of the picture

California, University of. A state-supported, coeducational university, with headquarters at Berkeley, but with six other campuses, at Los Angeles, San Francisco, Davis, Riverside, Mt. Hamilton and La Jolla. During the year 1942, the University of California adopted a full war-time schedule. In keeping with advice from the War department and the Navy department its object was to maintain all of its basic educational services and to streamline them in conformity with war needs. The principal changes were as follows:

A list of War Service courses considered to be basic to effective participation in the war effort, either in the armed forces or in industry, was prepared, and inclusion of one of these courses in each student's study program was made mandatory. The calendar of the university was drastically altered, from two 16-week semesters a year to three terms of approximately the same length. Under this so-called "speed-up" program the university is in operation, with brief intervals of a few days between terms, for twelve months a year, and students may complete a normal four-year course for a degree in two years and eight months. The normal 7-year medical course may be completed in four years and eight months. There was no diminution of subject requirements or lowering of standards of instruction.

A survey made by the university in 1942 indicated that as a result of its compulsory military and naval training program, there were available among alumni of draft age, at the outbreak of the war, approximately 4,000 men who had satisfied requirements for reserve officers' commissions and 40,000 who had received two years of basic military training. Comparative figures indicated, also, that the University of California had put into operation the largest university program in engineering, science and management war training in the country. By the end of the summer of 1942, more than 20,000 men and women had been given technical training for war industries, particularly aeroplane and shipbuilding plants. (R. G. S.)

Callaghan, Daniel Judson

(1890–1942), U.S. naval officer, was born July 26 in California. He was graduated from Annapolis naval academy in 1911 and served in the Nicaraguan campaign in 1912. During World War I, he served on a cruiser convoying merchantmen across the Atlantic. He was naval aide to President Roosevelt, 1938–41, and then was assigned to independent command at sea aboard the cruiser "San Francisco," which was in Pearl Harbor for repairs when the Japanese struck on December 7. Later, he took the vessel to the South Pacific and was subsequently made chief of staff to Vice-Adm. Ghormley, then commanding U.S. naval forces in that area. Rear Adm. Callaghan was in command of a flagship (presumably the "San Francisco"), during the big Solomons naval battle, Nov. 13–15, and was killed when a shell hit the ship's bridge.

Calvé, Emma

(Emma de Roquer) (1858?–1942), French opera singer, was born in Decazeville, Aveyron, France, but spent her early childhood in Spain. At 14 years of age she began to study voice. In 1882 she made her debut in Brussels as Marguérite in *Faust*. She sang in Rome and at Covent Garden, London, gave a command performance for Queen Victoria, and in 1893 made her debut at the Metropolitan in New York city in *Cavalleria Rusticana*. She created a sensation in New York in the role of Carmen and remained at the opera for 13 consecutive seasons. She retired from the stage shortly after World War I and later taught singing in France. News of her death in Millau was released from Vichy, Jan. 6. (See *Encyclopædia Britannica*.)

Cambodia: *see* French Colonial Empire.

Cambridge University.

The number of matriculations in the academic year 1941–42 was 1,759. The corresponding numbers for 1939–40 and 1940–41 were 1,923 and 1,513, as compared with the average in prewar years of 1,800. The number of men in residence was 2,750, about half the prewar total, which may be contrasted with 444 in Oct. 1917 one-eighth of the normal number. This showed the efficacy of control of man power in World War II. The evacuated London colleges were still in residence.

The following occupants of chairs retired: Dr. H. D. Hazeltine (law), G. H. Hardy (mathematics), W. B. Anderson (Latin) R. S. Hulton (metallurgy). The mistresses of Girton, Miss Wodehouse, and of Newnham, Miss Strachey, also retired. There were 16 vacant chairs and 16 other professors absent on national service.

During an air raid the Union society library was partially destroyed. Civil defense duties made demands on students' time and the senior training corps and air squadron gave preliminary training for fighting services.

King Peter of Yugoslavia was in residence as an undergraduate and an honorary degree was conferred on the king of the Hellenes. The Order of Merit was conferred on Prof. E. D. Adrian. (C. Fo.)

Camp Fire Girls.

In 1942 the Camp Fire Girls began work on their new "Service for Victory" program, a conversion of their normal program to wartime service. To direct their efforts to the need of conservation, a "Serve by Saving" project was launched in Nov. 1942, developed in cooperation with such government agencies as the war savings staff of the treasury department, the salvage section of the War Production board, the consumers' division of the Office of Price Administration, etc.

The Horizon club, senior Camp Fire organization for high school girls which was formally launched on a nationwide basis in Oct. 1941, increased in membership to approximately 4,700 during 1942. Their special project for 1942, "America's Children," led Horizon club members to ascertain the needs of handicapped children in their communities, what was being done for them, and what they could do to help.

An intensive campaign for volunteer leaders was conducted throughout 1942, to offset the shortage of leaders caused by women moving to centres of war industry, going into industrial or other war employment or volunteering for the more obvious war services.

During the summer of 1942 all but three Camp Fire camps were in operation, the directors having found resourceful ways of meeting the problems of transportation and adequate staff. Every effort was made to provide this experience in camp because it was felt that girls needed it more than ever to offset nervous tensions and increase physical fitness.

At the meeting of the National Council of Camp Fire Girls held in New York city Oct. 9–10, 1942, Mrs. Quade C. Weld of Minneapolis, Minn., was elected president. The other officers in 1942 were: Mrs. Elbert Williams, first vice-president, Mr. Earle W. Brailey, treasurer, Mr. Lester F. Scott, secretary and national executive. President Franklin D. Roosevelt was honorary president of Camp Fire Girls and Mrs. Roosevelt honorary chairman of the advisory committee. (C. F. Lo.)

Canada, Dominion of.

A dominion of the British Commonwealth of Nations (Statute of Westminster, 1931, 22. Geo. V.c.4.) covering all the portion of North America north of the United States, except Newfoundland, Labrador and Alaska. The Dominion is a federal union of nine provinces united under the terms of the (imperial) British North

America Act of 1867—Ontario, Quebec, Nova Scotia and New Brunswick in 1867, Manitoba 1870, British Columbia 1871, Prince Edward Island 1873, Alberta and Saskatchewan 1905. Outside the provincial boundaries, the Yukon and Northwest Territories are under the federal government. Area, 3,729,665 sq.mi.; pop. (1941) 11,505,898. Capital, Ottawa (pop. 154,585). Montreal is the largest city (city proper 890,234). Provincial capitals in the order of the provinces listed above are Toronto (city limits 657,612); Quebec (147,908); Halifax (69,326); Fredericton (9,905); Winnipeg (225,437); Victoria (42,507); Charlottetown (14,460); Edmonton (92,404); Regina (56,520). Other leading cities are Vancouver (271,597); Hamilton (167,830); St. John, N.B. (50,084); Kingston (29,545); Fort William (30,370); Port Arthur (24,217); Saskatoon (42,320).

The governor general in 1942 was the earl of Athlone; prime minister, William Lyon Mackenzie King.

History.—The year 1942 marked the 75th anniversary of confederation, July 1. The dominion government continued under the leadership of Prime-Minister Mackenzie King and the Liberal party, re-elected March 26, 1940. Arthur Meighen was leader of the opposition from Nov. 13, 1940, upon the resignation of R. B. Hanson, until his resignation Dec. 9, 1942, at the Conservative convention held in Winnipeg Dec. 9–12, at which John Bracken, premier of Manitoba, was elected leader of the party. Bracken, who had never been affiliated with the Conservative party, had announced that he would not accept the nomination unless the party name were changed. He was persuaded to run for the leadership, and if successful to ask for the change of party name. Shortly after he was elected it was decided to abandon the historical name "Conservative" in favour of "Progressive Conservative." Other men in the field for leader were M. A. MacPherson, J. G. Diefenbaker, Howard C. Green and H. H. Stevens. Still others considered were Col. George A. Drew and Sidney Smith, who withdrew in favour of Bracken. At the close of 1942, Bracken still had no seat in the federal parliament. The constituency of Selkirk (Man.) was opened to a by-election by the announcement (Dec. 15) that the sitting member, J. T. Thorson, minister of national mines, had been made president of the exchequer court. M. J. Coldwell succeeded J. S. Woodsworth, who died March 21, 1942, as leader of the Co-operative Commonwealth Federationist party.

In the provincial governments no general elections were held during 1942. On Oct. 21, 1942, Mitchell Hepburn resigned as premier of Ontario. The attorney-general, Gordon Daniel Conant, was named to succeed him. Much controversy had arisen over Mr. Hepburn's campaign against the federal government plebiscite on conscription, and his defense of various communist leaders in Canada. In Feb. 1942 a caucus of Ontario Liberals in Ottawa formally repudiated Hepburn for his stand on these questions.

Several important by-elections were held during 1942. On Feb. 9 in by-elections for the federal parliament, three Liberals were elected: Gaspard Fauteux (Que.); Louis St. Laurent, minister of justice (Que.); Humphrey Mitchell, minister of labour (Ont.); and in Ontario the C.C.F. candidate, J. W. Noseworthy, defeated Arthur Meighen, Conservative party leader. In the Quebec elections, the conscription issue was dominant. In both cases the new anticonscription party, the "Canadian party," was defeated. After the by-elections of February the house of commons in the dominion government stood: 177 Liberals, 38 Conservatives, 10 Social Credit, 9 C.C.F., 3 Liberal Independents, 3 Liberal Progressives, 2 Independents, 1 Independent Conservative, 1 Unity party, 1 Canadian party (anticonscription), 1 vacant. On Dec. 14, 1942 the standing of the senate was 46 Liberals and 38 Conservatives, with 12 seats vacant.

On July 25, 1942, the Canadian house of commons rejected, 130–34, an opposition amendment demanding the complete reorganization of the department of national defense at the end of the debate on the findings of the Royal commission on the Hongkong expedition.

On Jan. 22, 1942, after much controversy on the question of conscription, it was announced at the opening of the session of parliament by the governor general, the Earl of Athlone, that a plebiscite would be held and that an affirmative vote would release the prime minister from the anticonscription pledge he gave when he was returned to power in March 1940. A plebiscite was held on April 27, in which Canadian voters approved releasing the administration from its pledge, two to one: 2,633,284 for, 1,506,412 against; 72% of the people from Quebec voted against this; of the armed forces, 251,118 for, 60,885 against. On May 11, Prime Minister Mackenzie King introduced a bill in the house of commons to amend the Mobilization act and remove the ban on conscription for overseas service. P. J. A. Cardin, leader of the Quebec Liberals and minister of works and transport, resigned from the cabinet in protest against total draft, and a subsequent split in the Liberal ranks was threatened. The bill was changed to permit sending drafted men overseas "if necessary," and was passed by both the house of commons and the senate with little opposition except from the members from Quebec province.

On Sept. 30 compulsory military service was extended to include 19 year old males and to include all unmarried men of military age except enemy aliens. Nationals of all belligerents, including Americans, who had declared their intentions to become Canadian citizens were made liable for service. The United States government agreed to the action in an exchange of notes. On Dec. 15, it was announced that married men between the ages of 19 and 25 would be called up beginning January 1, 1943.

On May 27 J. H. King (B.C.), acting government leader of the senate, was appointed minister without portfolio, on the death of Raoul Dandurand. On Oct. 6, other federal cabinet changes were announced; Joseph T. Thorson, minister of war services, was made president of the exchequer court of Canada. He was succeeded as minister of war services by Major General L. R. LaFleche, associate deputy minister. Ernest Bertrand, Liberal member of parliament for Montreal-Laurier, was appointed minister of fisheries, and Alphonse Fournier, Liberal member for Hull, Que. was named minister of public works.

Ministers were exchanged with three new countries for the first time during 1942—the U.S.S.R., China and Chile. On June 12, the high commissioner of Canada in England, and Ivan Maisky, the Russian ambassador to England, signed an agreement in London for a soviet minister to Canada. Russia also opened a consulate in Halifax. On Nov. 4, it was announced that L. D. Wilgress, deputy minister of trade and commerce, had been chosen as minister to Russia, Maj. Gen. Victor W. Odlum minister to China, and Warwick Chipman to Chile. Justice T. C. Davis was named to succeed General Odlum as high commissioner to Australia.

Norwegian, Polish and Yugoslav legations were opened in Ottawa during the year, the respective ministers being Daniel Steen, Victor Podowski, and Dr. Isidore Cankar, former consul at Ottawa.

In May, Prime Minister King announced that all French consulates and consular agencies in Canada had been asked to close, as under existing conditions they were of little value and objects of suspicion. On Nov. 9 relations with the Vichy government were completely broken, and on Nov. 30, Brig. Gen. George P. Vanier, Canadian minister to the exiled United Nations government in London, was designated Canadian representative to the French National committee (the Fighting French).

In May Col. O. Biggar, chairman of the Canadian section of the U.S.-Canadian Joint Defense board, was named director of censorship, and a Wartime Information board was established under C. Vining, head of the newsprint association in Canada, with Philippe Brais, minister without portfolio in the Quebec government, as vice-chairman. Lawrence Weldon was named to succeed Vining. On March 30, Hume Wrong was chosen Canadian representative on the new Pacific War council formed in Washington. In September changes in the Canadian Broadcasting corporation were announced. Major Gladstone Murray, former general manager, was appointed director-general of broadcasting, and Dr. J. S. Thomson, president of the University of Saskatchewan, was appointed general manager for one year.

Among other appointments during 1942 were (Sept.) Maj. James E. Hahn as director-general of the Canadian Army Technical Development board, and Harry J. Carmichael as co-ordinator of production for the department of munitions and supplies (Sept.). On Nov. 18, Elliott M. Little resigned as director of the Canadian National Selective service because of "friction and obstructionism." He charged that confusion existed over the manpower policy.

In Dec. Austin Wright resigned from the post of assistant director to return to his former position as general secretary of the Engineering Institute of Canada. Adheman Raynault was re-elected in Dec. as mayor of Montreal by a sweeping majority.

In November, at a ceremony in Ottawa, 58 Canadians were decorated by the Earl of Athlone on behalf of the king, for services done for their country.

Numerous representatives from Great Britain and the United States visited Canada during 1942. In March General Sikorski, prime minister of Poland, arrived in Canada, and in June Queen Wilhelmina of the Netherlands and King Peter of Yugoslavia. Oliver Lyttelton, England's minister of production, visited Canada, and in Sept. Clement Attlee, British deputy-premier and dominion secretary. Prime Minister Mackenzie King went to Washington to attend the Pacific war council in June, and again in Dec., when postwar problems were discussed. At the end of September a government commission went to England—C. D. Howe, defense minister, Ralf Bell, director-general of aircraft production, and Desmond Clark, director-general of shipbuilding.

In Sept., Tim Buck, general secretary of the Communist party in Canada, and 12 other leaders surrendered to the Royal Canadian Mounted Police in Toronto, after having been in hiding since June 1940, when the government banned the party. St. Laurent, minister of justice, announced on Oct. 6 that these men had been granted a conditional release from custody. On Oct. 10, the Canadian department of external affairs ordered the shackling of 1,376 German prisoners in Canada as reprisal for the shackling of British and Canadian prisoners of war. On recommendation of Geneva these men were unshackled Dec. 12, although it was not known whether a similar action was to be taken by Germany.

GIRL WORKERS OF THE EVENING SHIFT entering the Canadian arsenal on the outskirts of Quebec in 1942

On Dec. 17 Prime Minister King announced a four-point temperance program designed to help achieve a maximum war effort. He ordered: (1) Reduction of the amount of beverage alcohol released from bond during the year beginning Nov. 1, 1942, from the previous 12 months, by the following percentages—beer, 10%; wine, 20%; spirits, 30%; (2) Prohibition of all liquor advertising for the duration of the war, after a six weeks' adjustment period; (3) Reduction in the alcoholic content of all distilled spirits to not greater than 30% under-proof, effective as soon as stocks packaged and ready for sale were exhausted; (4) Limitation of the hours of sale of spirits, wine and beer to eight hours per day.

With the United States in the war, numerous joint boards were set up during 1942 to pool the various resources of the two countries for the most effective prosecution of the war effort. One of the most important of the actions was the building of the new Alaska highway. On March 18 it was announced that under the auspices of the Joint Defense board, an agreement had been reached for the construction of a highway to Alaska, linking continental United States with Alaska, through British Columbia and the Yukon, and connecting also with road systems at each terminal. This highway, 1,671 mi. long from Dawson Creek, Alta., to Fairbanks, Alaska, was constructed under the direction of the United States army with extraordinary speed. It was opened to traffic on Oct. 28 and was officially dedicated Nov. 20. It served as an important line of communication for reinforcing U.S. troops in the Pacific, and naval bases at Kodiak, Sitka, Dutch Harbor, and the Aleutians, and supplies thereby to Russia and China. The construction was undertaken and paid for by the U.S. government. After the end of World War II, the Canadian part of the highway was to form an integral part of the dominion's road system.

In Dec. 1941 a joint Canadian-United States War Production committee was formed. During the first six months of 1942, duplication of production had been greatly reduced, and many materials in which shortages occurred were exchanged. The head of the Canadian committee was G. R. Sheils, deputy minister of the department of munitions and supplies. Ten joint technical sub-committees were appointed, also three other joint committees; the permanent joint board of defense, the materials co-ordinating committee and the joint economic committee. Thus in June, in order to relieve the metal shortage, the Reconstruction Finance corporation of the U.S. began to finance the development of marginal and sub-marginal copper, zinc, lead and graphite mines in Canada, and to finance the opening of new mines and enlarge old ones in British Columbia, Ontario, Quebec and New Brunswick. The project, which was estimated to value millions of dollars, was handled on the Canadian end through George Bateman, Canadian Metal comptroller and the Wartime Metals, Ltd., a dominion government corporation. It was expected that this scheme would be extended to other strategic metals such as tungsten and vanadium but not, however, to gold, silver and other precious metals.

In Dec. 1942 the United States, the United Kingdom and Canada created a combined committee to recommend means of increasing steel output and obtaining the most efficient possible use of steel in 1943. D. B. Collyer was named Canadian representative.

Canada also participated during 1942 in a joint income tax convention, in an air training conference of 14 nations held in Ottawa in May, and in the wheat pool formed in June in Washington under which Canada was to contribute for relief purposes in war-stricken areas. Newsprint allocation also came under the joint United States-Canada board during 1942.

In March the United States and Canada made arrangements whereby about 15,000 Americans serving in the Canadian army might transfer to the United States army after April 1.

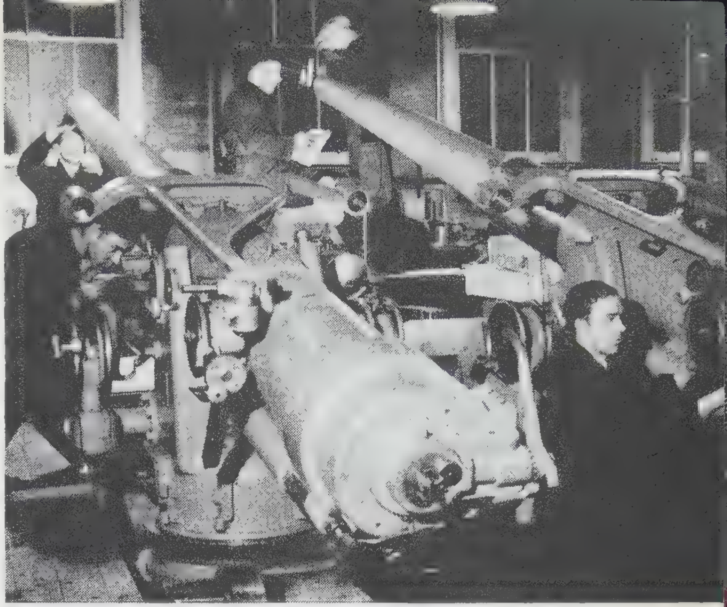
Canada at War.—All information in regard to the operation and occurrences of the war which could be of service to the enemy was withheld by the government in 1942. The facts and figures here given are strictly confined to information disseminated by the government itself, as found in the official monthly publication *Canada at War* and in the departmental reports, bulletins and general summaries in the *Canada Year Book* (Bureau of Statistics, Ottawa).

The third year of World War II witnessed the Canadian military effort at a very high level. During 1942 the prime minister declared that the army overseas numbered upwards of 180,000 men. It comprised one corps of three infantry divisions and another corps of two armoured divisions, along with auxiliary troops. At home, the army approximated 200,000 men on active service, with about the same number in the reserve army. Lieut. Gen. McNaughton became army commander, and Lieut. Gen. Crerar was given the command of one of the corps. In March, the army, air force and naval commands on the east and west coasts and in Newfoundland were unified. Gen. Alexander, Gen. Elkins, and Gen. Page became the respective commanders of these areas. One feature of army development was the emphasis placed on winter training, the use of skis, skill in patrol fighting, and the technique of living off the country. Facilities for training officers were greatly extended; to the original training centres at Gordon Head, B.C. and Brockville, Ont. were added temporary schools at Three Rivers, Que. and Camp Borden, Ont. The training schools overseas were abandoned, and all men recommended for commissioned ranks were asked to return to Canada.

The age for compulsory military training was progressively extended to include all single men and widowers between the ages of 19 and 30. In Dec. 1942, it was announced that married men between the ages of 19 and 25 would be called up in 1943.

The principal military event of 1942 in which Canadian troops participated was the raid on the nazi-occupied town of Dieppe on the French coast (Aug. 19). In all, 5,000 Canadian troops took part under the command of Maj. Gen. J. H. Roberts. He had with him, in addition, United States rangers, royal marine commandos, and Fighting French units. Under cover of naval and air attack, the landing force maintained itself for nine hours in the face of the enemy. A number of local successes were scored, and some important military objectives were destroyed. That greater success was not achieved was attributed to a chance encounter with a nazi convoy, previous to the landing, and the failure, after the landing, of some of the supporting troops to reach their objectives. Nevertheless, lessons were learned, and the practicability of attacking a well defended area was successfully demonstrated. Canadian losses were heavy, 3,500 men being listed as killed, wounded, prisoner or missing.

In 1942, the strength of the Canadian navy reached 48,000 officers and ratings manning 500 ships, including 13 destroyers, more than 80 corvettes, 3 auxiliary cruisers, minesweepers, submarine chasers, patrol ships, as well as smaller craft. Thanks to this much augmented fleet, Canada in 1942 carried 40% of the burden of patrolling the Atlantic. In this duty, it had convoyed more than 64,000,000 tons of cargo to Britain. The Canadian navy also took part in the Dieppe raid, and in Nov. 1942 supplied part of the covering force for the United States attack on North Africa. Seventeen corvettes, and more than 1,200 officers and men took part. Six Canadian floating convoys carried United States troops and equipment in the assault on Oran. Elsewhere, Canadian ships took part in the sea fighting near the Aleutian Islands, off the Alaskan coast. Close to home, Canadian naval and air forces parried nazi submarine attacks in the Gulf of St. Lawrence and in the West Indies. In the former area, 16 Allied vessels were lost. The most spectacular loss was that of the S.S. "Caribou," of the Nova Scotia-Newfoundland ferry service, on Oct. 14, when 238 persons perished.

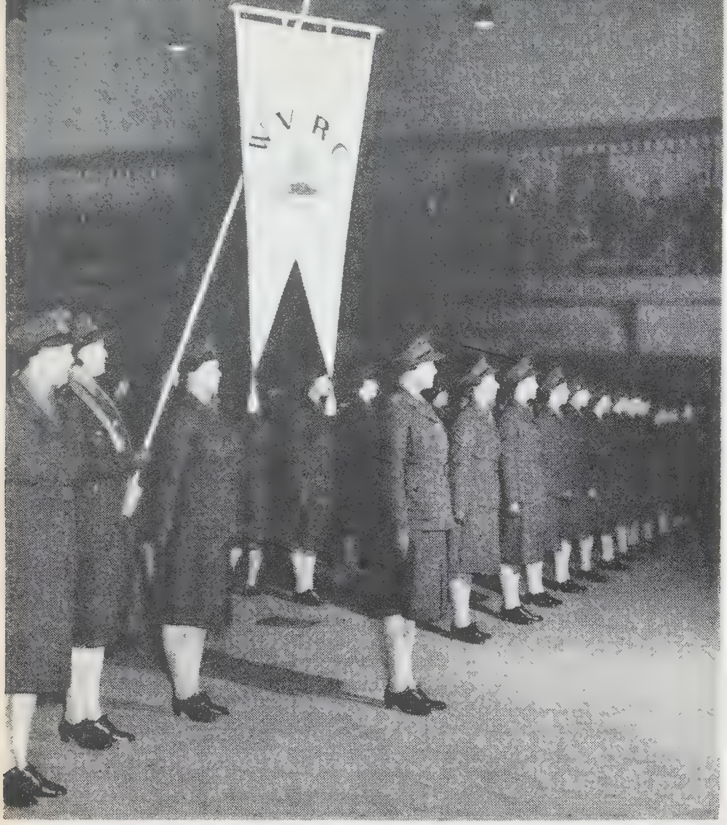


CRAFTSMEN of a Canadian naval repair station overhauling heavy naval guns in 1942

The Royal Canadian air force saw service on all fronts in the course of the year. The Commonwealth Air Training scheme, due to expire early in 1943, was extended to 1945. Under the new scheme, Canadian air training facilities were to be employed on a much larger scale in order to provide a single pool of personnel to be drawn on when required. The cost of the plan was to be borne by Canada and Great Britain, less payments for their own pupils by Australia and New Zealand. Significant changes were also made in Canadian air force administration overseas, enlarging Canadian control, and providing for the creation of exclusively Canadian units, bomber groups, fighter squadrons, coastal command squadrons, and so on, with ground staffs and operating as far as possible from Canadian stations overseas. In the middle east, the Canadian air force set up its establishment, comprising administrative services, auxiliary groups, and other specialist categories. In the North African campaign, opened in Nov. 1942, a number of Canadian air gunners, navigators and wireless operators served with the United States army air corps. Canadian airmen made extensive sweeps over western Europe in 1942.

Indicative of Canada's share in hemisphere defense was the co-operation of Canadian troops and airmen in the Alaskan area. In July 1942, a Canadian joint staff was formed in Washington under Maj. Gen. Maurice Pope, Rear Admiral V. G. Brodeus, and Air Marshal G. V. Walsh. A combined force of Canadian and United States troops was formed at Helena, Mont., to train in parachute tactics, under the command of Col. Robert T. Fredericks, United States army, with Col. J. G. McQueen, Canadian army, as second in command.

On the domestic front, the third year of the war opened with Canadian industry completely geared for war purposes. Fundamental to most of the war production was the development of the



CEREMONIAL PARADE of the Women's Volunteer Reserve corps, commonly called the "Beavers," at an armory in Montreal, Canada, in 1942

iron and steel industry. Much of this was centred in central Canada where, in the Niagara peninsula, electrical power is readily available. The estimated production of steel in 1942 was 463,000 tons, roughly four times the production of 1939. The production of pig iron rose from 1,528,000 tons in 1941 to 2,000,000 tons (estimated) in 1942. In order properly to co-ordinate national effort with that of the other allied states, Canada became a member of the steel committee with the United States and Great Britain. The committee proposed to pool production methods, technical information, and methods of distribution. Shipbuilding assumed the proportions of a great national industry with a program of 1,000,000 tons, in addition to the production of 200 or 300 naval craft. At the end of 1942, contracts called for the building of 300 10,000-ton merchant ships at an outlay of $600,000,000. In the last week of September, the 51st of these vessels was delivered, although only one had been completed before Jan. 1, 1942.

On the domestic scene, the most far reaching regimentation of 1942 was the establishment of the National Selective system in March. In order equitably to allocate Canadian man and woman power, a degree of compulsion was adopted, along with the gradual elimination of non-essential industries. The age for calling men up for the services was extended, and certain occupations were declared closed to physically fit men in the appropriate age categories. In August, the sole responsibility of mobilizing and allocating manpower was turned over to selective service, and in December, the calling up of men for the armed services was entrusted to it. At much the same time, the direction of the service was put into the control of the department of labour. In this way, parliamentary responsibility for the employment of Canada's most vital resource was assured. Under this administration, the employment of workers in non-essential jobs was rigidly controlled, and the casual drift of labour from one job to another was checked by requiring a seven days' notice before terminating employment. In a similar fashion, employers were prohibited from attracting workers from other jobs. Selective service possessed the right of summoning anyone, without exception, for interview, and indicating more essential war work. Compulsion was still withheld, except in the case of unemployed persons; when, however, a worker was transferred, he was guaranteed reinstatement in his old job at the termination of the war. The registration of Canadian woman power commenced in September; the first group to register was the 20–24 age group. To ease the burden on women already employed, the Canadian government, in collaboration with the provincial administrations of Quebec and Ontario, laid plans for day nurseries. In other ways, the health of women workers was being safeguarded. Women had already appeared in the armed services. The Canadian Women's Army corps totalled about 10,000 by the end of 1942. The women's Royal Canadian Naval service reported some 3,000 members in the same period, and on August 18, 1942, the first woman's contingent of the R.C.A.F. reached England. (J. I. C.)

Education.—The statistics collected in 1942 showed for all Canada an enrolment in ordinary and technical day schools (school year 1939–40) of 2,110,055; in private day schools, 88,397; in college preparatory courses, 19,803; university courses, including all summer schools, teachers' courses, etc., 102,833 students. These, together with night schools, correspondence schools and the 19,803 pupils enrolled in dominion Indian schools, made up a total school population, estimate of 1940, of 2,485,127 as against a national population of 11,505,898 of the census of 1941.

Defense.—See *Canada at War,* above.

Finance.—The fiscal year of the Dominion of Canada runs from April 1 to March 31. For the fiscal year 1942–43 the budget estimate was $3,900,000,000, of which $3,330,000,000 was for the war. It was expected that taxes would cover $2,050,000,000, leaving $1,850,000,000 to be added to the national debt. Receipts till Nov. 30 reached $1,453,760,000, of which income and excess profits taxes contributed $896,810,000, or more than double the receipts of the same period one year previously. The finance minister estimated at the close of the calendar year 1942 that the fiscal year outlay, owing to the speeding up of war production, would reach some $4,500,000,000. The calendar year 1942 witnessed the flotation of two successful war loans, each representing, though on various bases, an interest cost of about 3%. The loan of Feb. 1, 1942 (Second Victory Loan), announced with a minimum objective of $600,000,000, brought in subscriptions of $843,127,900 with conversions of $153,579,000 in addition. The number of subscribers was 1,680,000. The loan of Oct. 19, 1942 (Third Victory Loan), aiming at $750,000,000, brought in a total of $991,536,500 with 2,041,610 individual subscribers. The budget of 1942–43 contained special provisions raising excess profits taxes from 75% to 100% with 20% refundable after the war. The personal income tax was also increased, with provision for an additional levy, the "refundable" income tax, practically a forced loan, repayable with accrued 2% interest after the war.

The credit of the country despite this heavy taxation stood firm on a 3% basis. But the huge government expenditures and the increased rate and volume of wages created an unprecedented purchasing power. Thus, by the autumn of 1942, the price-control system established in the preceding year was visibly strained. To meet this problem, the minister of finance undertook to reduce retail prices of tea, coffee, oranges and milk by means of subsidies, at an estimated treasury cost of $40,000,000 a year.

As the result of negotiations between the minister of finance and the provincial premiers, it was announced on Jan. 15 that the Canadian provinces and municipalities will not collect personal income taxes and corporation taxes until one year after the war. A provision was made for annual compensation payments by the federal government to the provinces.

Trade and Communications.—The external trade of Canada was of necessity entirely altered in 1942 by the needs of a war economy. Information as to many things, shipping direction and ature of exports, etc., was withheld. Information given in Dec. 1942 by the department of trade and commerce showed domestic exports (10 months) valued at $1,890,000,000, more by $270,000,000 than the whole total of 1941. Total trade of the year was estimated at $4,000,000,000, as compared with $1,687,000,000 prior to World War II. Exports were made up of enormous quantities of food products to Great Britain and of munitions to various war fields.

In the field of transport, the outstanding feature of 1942 was the great increase in railway traffic, both freight and passenger. Car loadings bearing revenue numbered 3,189,447 in 1941 and had reached 3,261,418 by Dec. 12, 1942. The combined gross earnings of Canadian Pacific and Canadian National amounted to $571,000,000 for 11 months of 1942. In air transport the nationally-organized Trans-Canada Air Lines greatly extended its operation. It covered a route of 4,857 mi. in 1942, with 22,790 mi. of daily flight. The mail load of 1942 was 2,260,000 lb.—an increase of 63% over 1941; express, 396,000 lb.—an increase of 128%; passengers, 106,000—an increase of 24%. Service was extended to Newfoundland May 1, 1942. The principal feature of the year in regard to highway traffic was the completion late in 1942 of the final link in northern Ontario of the Trans-Canada highway, extending 4,000 mi. from the Atlantic to the Pacific. Restrictions on the use of motor cars permitted very little traffic in 1942. The building of the military Alaska highway is noted on p. 150.

Agriculture.—Many new records of production and marketing were made by Canadian agriculture during 1942. Grain production reached a new all-time high. Favourable weather conditions in the prairie provinces resulted in a wheat crop of 587,000,000 bu., 607,688,000 bu. for all Canada. The average yield per acre was 28.4 bu., compared with the previous high record of 26 bu. in 1915. An increase of 1,500,000 ac. in the area devoted to oats, combined with high yields, resulted in a crop of 651,976,000 bu. for all Canada, more than double the 1941 output. Increased acreage and higher yields resulted in a record barley crop of almost 259,234,000 bu.; flaxseed output, the largest in many years, was 14,991,000 bu., as compared with 6,566,000 bu. in 1941. The rye crop was 24,703,000 bu. The total supply of feed grains on hand at the end of 1942 was more than adequate to meet the requirements of the expanded livestock production. By June 1, 1942, the number of cattle had increased by 5.1%, sheep 11.6% and hogs 17% over the 1941 record. The farm cash revenue was up for 1942 almost to the previous high record of 1928, despite ceiling regulations on most farm commodities. The beef situation in Canada during 1942 was affected by increased military and civilian demands, and by a similar increase in demand in the United States, which attracted cattle to the American markets. Moreover, there was a reluctance of livestock raisers to market their cattle under price ceilings. To ameliorate the situation, all sale of cattle was put under a crown company under the Wartime Food Corp. Ltd.

The dominion government's wheat policy in 1942 provided for an initial minimum price of 90 cents a bushel for western wheat, an increase of 20 cents a bushel. The government moreover contracted to buy 280,000,000 bu. of the 1942 wheat crop. Provision was also made for proportionate assistance in coarse grains, and for a new freight assistant payment. The cost of the new policy was estimated at $100,000,000 for 1942.

After the opening of World War II an outstanding demand was made on the farmers of Canada for greater hog production. As reported in the press by James G. Gardner, federal minister of agriculture, Canada was asked in 1939–40 to supply to Britain 91,000,000 lb. of bacon and pork products; 331,000,000 lb. were shipped that year and, in 1940–41, 425,000,000 lb. From Nov. 1941 to Oct. 1942, 618,000,000 lb. were shipped. Urgent official representations from the government led, in 1942, to a voluntary curtailment of the home consumption. A similar demand for Canadian cheese led to shipment to Britain of 115,000,000 lb. in 1941–42. Shipments of powdered eggs were going to Britain in large volume, the 1942 contracts calling for 45,000,000 dozen. A program of increased sheep raising was also initiated.

Manufacturing.—The direction, scope and volume of manufacturing industry was profoundly affected by the war in 1942. Production generally was enormously increased. Certain industries, as notably the automotive-industry of General Motors and similar concerns, had been converted from their previous operations to the making of war machines, vehicles and munitions. The implement industry underwent similar though lesser change. In regard to the general aspect of manufacture, one notes for 1942 the great increase in the volume of employment; for every 100 hired in 1926 there were 110 in 1938 and 218 in 1942. The award of government contracts for construction had reached its peak in 1941 with a value of $393,000,000; it showed $281,000,000 for 1942. Pig iron production, standing at 846,000 net tons in 1939, reached 2,000,000 tons in 1942; steel production advanced from 1,551,000 net tons of ingots and castings in 1939 to 3,000,000 in 1942.

Mineral Production.—Mineral production for 1942 was greatly hampered by shortage of labour and supplies. Yet the completed returns showed a record annual value of $564,000,000 (an advance of $4,000,000) in spite of a decline in gold output amounting to $20,000,000. Demand throughout the year was greatly increased by British requirements from Canada of nickel, copper, lead, zinc and mercury and by the dependence of the U.S. on the dominion for nickel and asbestos. Home demand of war industries pressed hard. Before World War II, Canada exported 90% of its nonferrous base metal. In 1942, 65% of Canadian copper, 40% of zinc and 25% of lead were used at home. Special attempts were made in 1942 to stimulate the search and recovery of tungsten, chromium, vanadium and other strategic metals which Canada was compelled to import in whole or part. The dominion was producing in 1942 about 10,000,000 barrels of crude petroleum, 95% of it from the Turner valley, Alta., and from 400,000 to 500,000 tons of iron ore, a quantity far short of requirements, the bulk of it from the Michipicoten area, Ont. (S. Lea.)

Canadian Literature.

There were four costume novels of note. Thomas H. Raddall led with *His Majesty's Yankees,* a rollicking yarn of the American Revolutionary era. Grace Campbell wrote delightfully about her childhood locale of Glengarry, Ontario, in *Thorn-Apple Tree,* which described pioneer life in the very early 1800s. Ethel Kirk Grayson also wrote about early Ontario (and pioneering Saskatchewan) in *Fires in the Vine,* a family chronicle of note covering the years 1793 to 1936. *All the Trumpets Sounded,* by W. G. Hardy, continued in the vein of his earlier work, and was acknowledged the best fictional interpretation of Moses to that date. There were three outstanding novels having modern themes. Dyson Carter, a Manitoba scientist, described human undercurrents in hospital life in *Night of Flame,* and achieved memorable suspense. Mazo de la Roche turned from her Jalna saga to write of England and America finding new values when allied against naziism, in *Two Saplings.* The first notable newspaper novel appeared when Herbert Sallans produced *Little Man,* which dramatized Canadian life for a generation beginning with the turn of the 20th century.

Poetry.—The crop of books of collected poems was short in the stock but heavy in the ear. Definitely in the lead was Canon James Edward Ward's *This England,* the Canadian version of *The White Cliffs of Dover,* and marked by a unique combination of refined nostalgia and altruistic patriotism. *Canada at Dieppe,* by Arthur S. Bourinot, caught something of Canada's glorious record during that heroic assault. The 40 lyrics in the posthumous book of Mary McCullough (died March 1942, aged 27), *The Sky Was My Friend,* were hailed all across the dominion, and the volume had the distinction of going into a second edition, a rarity in Canadian verse publication. *For Freedom,* by Wing Commander G. L. Creed, R.C.A.F., was the best of a large number of books of patriotic verse.

Nonfiction.—The *Unknown Country,* by Bruce Hutchison, combined impressionism and realism to produce a masterful portrait of modern Canada. Emily Carr repeated her 1941 success with *The Book of Small,* a series of appealing sketches of her early childhood in British Columbia. Canada in the modern world was the general theme of a number of studies. *Canadian External Relations,* by G. P. de T. Glazebrook, *Canadian Economic Development,* by A. W. Currie, *Canada's Role in Geopolitics,* by Griffith Taylor, were authoritative in their fields. Further books dealing with current affairs, in the international sphere, were *Peace by Power,* by Lionel Gelber, *The War: Third Year,* by Edgar McInnis, *Democracy Needs Education,* by Julia G. Wales, and *Russia's Secret Weapon,* by Dyson Carter. C. F. Klinck's *Wilfred Campbell* was a distinctive contribution to Canadian literary biography, and C. W. Jeffery and T. W. McLean's *The Picture Gallery of Canadian History* gave high lights of Canada's past in text and picture with stirring impact. Clara Dennis added to her reputation as a skilful popularizer of geography with *Cape Breton Over.* The most effective inspirational book of 1942 was Dr. Archer Wallace's *Leaves of Healing.*

Literary Awards.—The governor-general's medals for 1941 went to Anne Marriott for *Calling Adventurers* (poetry), Alan Sullivan for *Three Came to Ville Marie* (fiction), Emily Carr for *Klee Wyck* (general nonfiction). The Ryerson Press award for 1942 (inaugurated in 1942) went to Herbert Sallans for *Little Man.* (C. Cy.)

Canals and Inland Waterways.

The principal canals and inland navigable waterways of the United States in 1942 included the Great Lakes, the Mississippi river system, the Illinois waterway, the New York State Barge canal system, the Atlantic Intracoastal waterway extending from Trenton, N.J. to the Florida keys, the Gulf Intracoastal waterway extending from the St. Marks river in Florida to Corpus Christi, Tex., the Tombigbee waterway, Alabama, the San Joaquin-Sacramento river system in California, and the Columbia river system in the northwest.

The Great Lakes had natural deep water except in the connecting channels which had been artificially deepened where necessary to accommodate deep-draught vessels. These connecting channels were the St. Marys river and canal between Lake Superior and Lake Huron, the Straits of Mackinac connecting Lake Huron with Lake Michigan, the St. Clair river and lake and the Detroit river between Lake Huron and Lake Erie, the Welland canal joining Lake Erie and Lake Ontario, as improved by Canada, and the St. Lawrence river to the sea.

The Mississippi river system embraced the river proper, the Red, Arkansas, Missouri, Illinois, Ohio and other streams. The Mississippi river had a channel suitable for deep-draught, ocean-going vessels upstream to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and in its principal tributaries which included the Ohio river and the Missouri river. The Ohio river had several navigable tributaries, the more important being the Allegheny, Monongahela, Kanawha, Muskingum, Kentucky, Cumberland and Tennessee rivers.

The Illinois river and waterway to Lake Michigan had a barge channel which connected the Great Lakes with the Mississippi river system. An additional outlet from the Great Lakes to the sea was via the Oswego and Erie branches of the New York State Barge canal between Lake Ontario and the Hudson river.

The Atlantic Intracoastal waterway and the Gulf Intracoastal waterway provided protected channels for barge and other light-draught coastwise navigation. A dredging program to maintain the project dimensions of the Atlantic Intracoastal waterway had been vigorously prosecuted and in general full project channel depths were available from the Chesapeake bay terminus of the waterway at Norfolk, Va., to the Florida keys. The Gulf Intracoastal waterway had been the subject of a continuous dredging program and a channel for barge navigation was available from the vicinity of Apalachee bay, Fla., to Corpus Christi, Tex. In 1942 the extension of this waterway into Corpus Christi was completed and the construction of flood gates was under way at the Brazos river and Colorado river crossings. To facilitate the movement of barge tows and other waterway traffic, the act of congress approved July 23, 1942, authorized the enlargement of the existing Gulf Intracoastal waterway from the vicinity of Apalachee bay to Corpus Christi and its extension to the Mexican border. That act also authorized the construction of a barge canal across northern Florida connecting the St. Johns river and the Withlacoochee river. A program of dredging operations was initiated to provide the authorized enlarged channel in the section from Carrabelle, Fla., westward to New Orleans, La., and in certain other reaches of this extensive coastal waterway route.

The Tombigbee waterway, one of several feeder channels of the Intracoastal waterway, extended from Mobile harbour, Ala., far inland through the Mobile, Tombigbee, Warrior and Black Warrior rivers. The San Joaquin-Sacramento river system, with an outlet to the sea through San Francisco bay, provided a deep-draught channel to Stockton, Calif., on the San Joaquin river and a moderate-draught channel to Sacramento, Calif., on the Sacramento river and in addition other channel improvements. The Columbia river had a deep-draught channel to Portland, Ore., and to Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by Bonneville dam and thence depths for barge navigation upstream to and including the Snake river.

Other important canals of the United States included the Cape Cod canal, Mass., and the Chesapeake and Delaware canal, Md. and Del., which accommodated ocean-going vessels; and the Okeechobee-cross-Florida waterway which afforded a light-draught barge channel across southern Florida. (E. Rd.)

Great Britain.—In Great Britain during 1942 canals engaged a considerable amount of government attention in the hope of extending their use in war time. The late Frank Pick had been instructed to report upon the carriage of traffic on canals and inland waterways. The report was duly completed but not made public. Subsequently, the minister of war transport took over the control of eight businesses engaged in canal transport and it was announced in the press that all the principal canal undertakings in Great Britain were to be controlled in the same manner as railways. Some 2,500 mi. of canal were affected by this decision.

Apart from the question of operation, certain extension schemes were brought before the public notice. A scheme for connecting the Tay and the Clyde was considered and officially abandoned on the ground that it was not practicable at the moment to carry out the necessary preliminary survey work. Another project for which enthusiasm was revived was that of a ship canal across central industrial Scotland connecting the firths of Forth and Clyde for vessels of sea-going calibre as a through route for shipping from the North sea to the Atlantic. A barge canal effecting this junc tion already existed, but it was only available for craft 68.5 ft. in length, 19.7 ft. in beam and drawing 8.75 ft. of water.

A novel proposal was mooted by J. F. Pownall for a single-level main canal from Newcastle to Southampton. Calling it the Grand Contour canal, the projector claimed that such a canal could be constructed at a uniform level of 310 ft. above sea level and advocated a waterway 30 m. (or 100 ft.) wide at the top, with a depth of about 17 ft., sufficient for craft up to 1,500 tons displacement. The estimated cost was £150,000,000.

River training works in England continued to be pursued by the various catchment boards set up under the Land Drainage Act of 1930; the improvement of the River Nene was completed at a cost of over £1,000,000. It provided safe and convenient navigation for barge traffic from the Wash to towns in the Midlands.

Europe.—On account of the war, little information was forthcoming as to the development of canal construction on the continent of Europe. In Sweden, the official opening had taken place of the Falsterbo canal through the isthmus of Scania. It has a length of 27 km.; at mean water level the depth is 6.7 m.; vessels of 20 m. beam can pass through. From Germany came news that a central association for German inland shipping had agreed on nine types of standard craft for the various waterways in that country, ranging from 85 m. by 9.5 m. by 2.65 m. to 41.5 m. by 5.10 m. by 2.2 m. (B. Cu.)

Cancer.

Neutron Beam Treatment of Cancer.—A very important paper on the treatment of cancer with fast neutrons by Stone and Larkin appeared in Nov. 1942 ("The Treatment of Cancer with Fast Neutrons," Robert S. Stone and John C. Larkin, Jr., *Radiology* 39: 608, 1942). The authors report in detail the results of the care of 120 patients with various types of cancer. The cyclotron used to produce the neutrons was capable of delivering these particles with an energy of 21,000,000 electron volts. It is to be noted that this was not the same thing as 21,000,000 volts of electrical potential, the factor determining the wave length of x-ray. The neutrons were first filtered through 3 cm. of lead. This thickness absorbs almost wholly any x-rays which may accompany the neutrons, but as the latter are uncharged particles, they can, so to speak, slip between the nuclei of the lead atoms without much loss. A considerable thickness of water or paraffin is a much more effective filter for neutrons.

The analysis of the results on patients treated showed that some of them suffered from severe general reactions, such as are seen with x-ray therapy. In about one-fifth, the tumour disappeared within three months, which does not mean that the patients were cured, but merely that the tumour disappeared. Partial disappearance was noted in slightly less than one-half the patients, and in one-fifth no change was observable.

In general, this is no better than can be obtained with suitable x-ray treatment. Originally it was thought that the neutrons offer special advantages, as they give a greater density of electron radiation in a given cubic content of tissue than does x-ray, but the difficulties of measuring the neutron rays with accuracy, and the variable results which have been obtained by those who have attempted to measure the effect of a beam with biologic material have prevented any accurate comparison between the two. The fact that there is no back-scatter from a neutron beam was found to be an advantage in treatment, for it allowed a larger amount to be given through the skin than is the case with x-ray in which the back-scatter in the ordinary type of 200,000 volt machine amounts to something like 35%. The impression gained by those who have the largest experience in the neutron treatment of cancer is that these particles are more destructive of the normal tissues than equivalent amounts of x-ray. But all this study of a new physical agent of this type showed that the fact that a considerable quantity of energy can be set free in a tumour inside the body without great damage to the skin does not necessarily result in a cure of the disease. The experienced radiologist is quite aware that there are as yet many unknown factors in the reaction of malignant tissues to x-ray, and that no two tumours behave exactly alike in their response to x-ray or radium therapy. The only situation where the sensitivity of the tumour is of relatively little importance practically is in the skin, where large doses of x-rays, radium rays or neutrons can be given to small tumours with a reasonable probability that a cure by complete destruction of the tumour may be obtained. Such dosage is impossible in conjunction with internal tumours, unless the growth is so localized and so accessible that radium needles can be directly implanted.

It was hoped when the cyclotron was developed and found to give off heavy beams of neutrons that the fact that these particles were not charged would enable them to penetrate to a considerable distance into the body, and then suddenly discharge locally, so to speak, a large amount of energy in the form of electrons. But whatever occurs, there was no evidence at the close of 1942 that the results are more favourable than those obtained by the use of x-ray. Also there were but few cyclotrons available for neutron beam treatment, and those physicians who were favourably situated, as were the authors, will have to furnish the records of many carefully observed patients and compare the results with those obtained from the same type of tumours after the application of x-ray. If it can be shown after a five year observation of a statistically satisfactory number of patients with varied types of cancer that the neutron treatment is more effective in any type of disease than x-ray or radium, cyclotrons will have to be constructed at no matter what expense in population centres where the maximum number of patients can be treated.

Hormone Treatment of Cancer.—For some 25 years it has been known that extracts from the ovary and placenta when injected into female animals caused an enormous overgrowth of the uterus and breast. Similar studies on the male sex organs have only been completed in the last few years, when it was shown that the glandular tissue of the breast of the female rabbit and rat could be altered by the injection of male sex hormone, and also that the glandular content of a benign breast tumour occurring in the female rat could practically be removed by the administration of male sex hormone, and on the other hand, the glands greatly increased by the administration of the corresponding female sex hormone. These discoveries led to an attempt to reduce the dimensions of the prostate in simple hypertrophies in which the gland substance was superabundant, and a certain amount of at least temporary benefit was unquestionably observed in a few patients.

Considerable benefit followed the administration of female sex hormone to persons with cancer of the prostate, and there is evidence that such treatment does cause shrinkage of the glandular structures in the prostate. ("Carcinoma of the Prostate Treated with Diethylstilbestrol," Norris J. Heckel and Herman L. Kretschmer, *J.A.M.A.*, 119: 1087, 1942.) Also metastatic deposits at a distance, in the bones and elsewhere, have shown a tendency in a certain number of cases to shrink, and therefore lessen the pain due to pressure of the growth. In most instances a synthetic product has been used, diethylstilbestrol. Possibly better results will be obtained with the use of large quantities of theelin, as the latter product has shown itself to be in many instances more effective than the synthetic compounds. No claim has been made that cancer of the prostate can be cured, and it is necessary to be especially cautious in judging results, because it is well known that untreated cancer of the prostate may exist for many years in a quiescent stage. Also the diagnosis of carcinoma of the prostate is not always certain from the small amount of biopsy material which is ordinarily available to the pathologist. But enough benefit has accrued to the few patients who have so far been studied to make it clear that a certain amount of relief may be obtained, and in some instances the total disappearance of the symptoms due to the tumour, at least for a short time. There is no reason why such treatment should not be paralleled by the simultaneous administration of x-ray which also has, in some cases of cancer of the prostate, a considerable palliative effect. Certainly the facts already observed warrant a thorough study of a large number of patients in which the diagnosis has been made not only clinically but microscopically.

The Betatron.—An apparatus based upon principles somewhat similar to that of the cyclotron is the betatron, which also has been suggested by physicists as a useful agent in the treatment of cancer. The statement has been made in the press and in some scientific magazines that these betatrons are produced at a voltage of 20,000,000. This is somewhat misleading, for they are not produced at 20,000,000 volts of electrical potential, but at 20,000,000 electron volts, which is an entirely different thing. Inasmuch as radium gives off beta rays at approximately 6,000,000 electron volts and such electron beams have been found to be extremely destructive to healthy as well as cancerous tissues, their use has been long since abandoned. In almost all applications such rays are filtered off by metal filters so as to leave only the gamma rays of radium which act upon the cancer. The gamma rays have a much more selective effect in damaging the cancer cell and sparing the healthy tissues than have the beta rays. (*See* also MEDICINE.) (F. C. W.)

Candy. It was estimated that about 20% of the candy and chocolate produced in the United States in 1942 was shipped for consumption by armed forces in the U.S. and abroad. The army includes hard candy for Ration K, and the soldier's "last ditch" or extreme emergency food package, known as Ration D, contains hard chocolate and sugar, two of the most important candy ingredients. In addition, varieties of candies, particularly 5-cent and 10-cent bars, were purchased in large quantities for resale at post exchanges.

According to the U.S. department of commerce, 1,200 manufacturers, employing 50,000 persons, produced about 2,200,000,000 lb. of candy in 1942 or a gain in volume of about 10%. This was valued at about $400,000,000 wholesale. The average value of candy in 1942 was about 18 cents per pound compared with 16 cents in 1940, 15 cents in 1939 and 14 cents in 1938. Prices continued to advance throughout 1942. In October the average wholesale value of candy was 19.3 cents per pound as against 16.3 cents in Oct. 1941.

For the first time in its history, the candy industry in 1942 met sharp curtailments of ingredients. Immediately after the Pearl Harbor incident on Dec. 7, 1941, sugar stocks were frozen. In Jan. 1942 a sugar rationing or quota system was announced. At first, the candy industry received 80% of its sugar requirements. The quota was later reduced to 70%. In May 1942 grinding of cocoa beans was limited to 70% of the 1941 tonnage. In July this was reduced to 60%. During most of the year, chocolate manufacturers supplied the candy industry to the extent of 60% of their requirements, based on 1941 purchases. There was no rationing of corn syrup in 1942, with the result that most manufacturers received up to 120% of their corn-sugar requirements. The shortage of chocolate proved to be more of a problem for candymakers in 1942 than the shortage in sugar. In addition to corn syrup, other sugars and sweeteners were used, notable of which were molasses and malt sugar. The latter is a brewery by-product.

On Dec. 4, 1942, the War Production board issued a new chocolate conservation order, prohibiting the use of chocolate in the manufacture of Christmas, Easter and other holiday novelties, hollow moulded goods and chocolate shot (decorative sprinkles). Miniature chocolates were restricted to consist of 60 or more pieces to the pound, and the use of chocolate decorations was banned. Normally, the candy industry uses 222,000,000 lb. of chocolate per year. Shortages of candy were noted during the Christmas season and candy and newsstands were emptying quickly as the year drew to a close.

In 1942, many candy plants were converted for direct war work, with some factories making radio, plane and gas-mask parts as well as other nonedible necessities.

The candy industry's annual tonnage is divided as follows: bulk candy, 33.6%; penny goods, 15.7%; bars, 1-cent, 5-cent and others, 35.4%; plain packages, 8.7%; and 5-cent and 10-cent packages other than bars, 5.5%. (H. D. G.)

Cane Sugar: *see* SUGAR.

Canning Industry. U.S. and territorial canned food production in 1942, including canned vegetables, fruits, fish, meat and milk, totalled about 498,000,000 cases, compared with 512,000,000 cases in 1941. Regular canned food items were packed in somewhat lower quantities than in 1941, but the total pack was greater in 1942 as a result of canning considerable quantities of special rations for the armed forces. Production statistics for rations were not available.

Government restrictions on the use of tin plate markedly affected the composition of the pack of regular items. Nonseasonal products were greatly restricted and some seasonal products were curtailed. The net results of the adjustments were: a 10,000,000-case increase in the pack of seasonal vegetables; a slight lowering of the pack of fruits and fruit juices; a moderate reduction in the fish pack; an increase of about 10,000,000 cases each for canned milk and meat. Of the available packs, government quotas controlled the amounts of canned foods available for civilian use.

The restrictions of critical materials, especially tin, induced a stage of transition in canning technology, particularly in respect to containers. Attention was directed to reduction in the use of tin and research was undertaken to determine how this might be done. These investigations were still in progress at the end of 1942, but already there had begun a gradually increasing use of electrolytic tin plate having a weight of 0.5 lb. of tin per base box as compared with 1.25 lb. for the conventional hot-dipped plate. Also coming into use was "bonderized" plate, having no tin coating but chemically treated (phosphatized) to reduce corrosion, further protection being afforded by enamel. Glass containers were used to a greater extent in 1942 than 1941—14,000,000 cases, or 4% of the total fruits and vegetables in 1941, and an estimated 31,000,000 cases, or 11% of the total in 1942.

In can manufacturing a large quantity of tin was conserved by the introduction of solder composed of 97.5% lead, 2.5% silver; as against the conventional solder made of 60% lead and 40% tin.

Extensive research studies were begun on nutritional values in heat-processed foods. This work, supported jointly by the canning and can manufacturing industries, was planned first to determine dietary factors and, later, to study technological factors which affected these values. This work, which would be carried on through 1943, was organized through financial grants to universities recognized for excellence in the field of nutrition. (E. J. C.)

Canterbury, Archbishop of

(William Temple) (1881–), English divine. For details of his early career *see Encyclopædia Britannica,* under Temple. Since 1929 Dr. Temple had been archbishop of York, and in 1942, on the retirement of Dr. Cosmo Gordon Lang, he was elevated to the see of Canterbury. It was he who organized the Malvern conference of 1940–41, the first report of which created a great sensation. The final report was issued early in 1942. Upon the important sections on the land question and the problem of money and the banks rested the archbishop's claim to public attention during 1942.

Immediately on his elevation the new archbishop found himself surrounded by ecclesiastics and laymen sharing his views, and the Albert Hall meeting of early autumn 1942 was but the signal that the new primate would be a political ecclesiastic of the first order, determined to give a Christian lead to public opinion on fundamental issues in England and the English speaking countries.

Among his numerous publications the following are outstanding: *The Gifford Lectures on Nature, Man and God* (1932–34), important for the chapter on the meaning of history; and *Readings in St. John's Gospel:* 2 vols. (1940–41). The latter, probably his greatest spiritual work, is a translation from St. John, with his own running commentary.

Capablanca, José Raoul

(1888–1942), Cuban chess champion, was born Nov. 19 at Havana, Cuba. He learned to play chess at the age of 4 and at 12 had won the championship of Cuba. At 20 he defeated Frank J. Marshall, then U.S. champion, in a nontitle match, and three years later won an international match at San Sebastian, Spain, against recognized top-flight players. In 1921 Capablanca won the world's chess championship by defeating Dr. Emanuel Lasker at Havana. In 1927 he lost his title to Dr. Alexander Alekhine of Russia in Buenos Aires. Most of the time after 1913 he was in the Cuban diplomatic service and was commercial attaché to Washington at the time of his death in New York city, March 8.

Cape Verde Islands: *see* Portuguese Colonial Empire.
Carbohydrates: *see* Chemistry.

Carlile, Wilson

(1847–1942), British clergyman and founder of the Church Army, an English religious organization, was born Jan. 14 in Brixton, England. At the age of 31 he left his office job to study for the ministry at the London College of Divinity. He was ordained in 1880, served as curate in London, but resigned when his parishioners disapproved of his holding street-corner services. In 1882 he conceived the idea for a Church Army, and with a band of evangelists he started mission work in the London slums. He trained an army of officers and soldiers, made up of lay people, as "Church of England evangelists," and established lodging houses for the poor, employment bureaus, food depots, dispensaries and social service bureaus. The Church Army's activities spread to India, South Africa and Canada, and a training college was established in Rhode Island in 1927. Rev. Carlile was prebendary of St. Paul's cathedral. He died in Woking, Surrey, Sept. 26.

Carnegie Trusts.

Carnegie Corporation of New York, established by Andrew Carnegie in 1911 and endowed with $135,000,000, devotes its annual income to grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge and understanding among the people of the United States and of the British dominions and colonies. Frederick P. Keppel, president since 1922, retired as of Nov. 18, 1941, and was succeeded by Walter A. Jessup, who serves as president of both the corporation and the foundation.

During 1941–42, the corporation trustees appropriated a total of $2,804,650: library interests, $249,300; adult education, $81,500; fine arts and museums, $445,950; research and publication, $599,515; general educational purposes in schools, colleges, universities, etc., $1,428,385. The amount appropriated since 1911 totals $187,235,199.

The five other separately administered Carnegie organizations in the United States, which were founded by Mr. Carnegie for specific purposes before the establishment of the corporation, with endowments ranging in 1941 from $10,000,000 to $30,000,000, followed their established programs described regularly in their annual publications.

Carnegie Institute of Pittsburgh (1896), which comprises a museum of fine arts, a music hall, a museum of natural history, a public library and an associated institute of technology, with a library school, carried out its normal programs.

Carnegie Institution of Washington (1902), devoted to scientific research, has expended since its organization $47,341,373 in its program of encouraging investigation, research and discovery, and the application of knowledge to the improvement of mankind, specifically by work in astronomy (Mt. Wilson observatory), terrestrial magnetism, geophysics, animal and plant biology, and historical research (especially in Yucatan). Many of its staff and a large part of its research faculties are engaged in services relating to the national emergency.

Carnegie Hero Fund Commission (1904), established to recognize heroic acts performed in the United States of America, the Dominion of Canada, the Colony of Newfoundland, and the waters thereof, by persons the nature of whose duties in following their regular vocations does not necessarily require them to perform such acts, announced that the list of its beneficiary aid shows a total of 3,231 recipients of medals and 288 persons receiving pensions. During 1941, 32 persons received educational awards and 25 others received pecuniary awards for specific purposes. Its awards for the year 1941 totalled $138,920.25.

Carnegie Foundation for the Advancement of Teaching (1905), established to provide retiring pensions for teachers and to advance higher education, paid $1,929,443.13 in retiring allowances to retired college professors, or their widows, making a total of $40,569,056.18 paid for such purposes since its establishment. It has also continued, chiefly from funds provided by the corporation, its program of educational research, including such activities as teacher-testing program, graduate examination study, etc.

Carnegie Endowment for International Peace (1910), established to serve the purpose indicated by its name, expended its funds in efforts to further friendly understanding among the nations of the world. (R. M. Le.)

Carney, Thomas Joseph

(1886–1942), U.S. business executive, was born April 7 in Chicago and was educated in Chicago public schools. At the age of 16, he joined Sears, Roebuck and Co. as an "extra" in the shipping department during the Christmas rush, and later became head of the department. His executive ability brought him steady promotion. From executive of a Chicago store, he became general superintendent at Dallas, Tex., general manager of Sears' eastern territory, vice-president of the company, 1930–39, and finally president, 1939–42. Carney died in Chicago, June 29.

Caroline Islands: *see* Pacific Islands, Mandated.

Carr, Wilbur John

(1870–1942), U.S. diplomat, was born Oct. 31 near Hillsboro, Ohio. He was graduated from Kentucky university, Lexington, 1889, and received an LL.M. degree at Columbian (now George Washington) university in 1899. Carr entered the U.S. state department in 1892 as a clerk. Later, he was made chief of the consular bureau, chief clerk of the state department and director of the consular service. He was named assistant secretary of state in 1924 and held that post until his appointment as minister to Czechoslovakia in 1937. He retired from the service after closing the legation in Prague in 1939. He died in Baltimore, June 26.

Catholic Library Association.

An organization for the spread of library work in Catholic schools, parishes and institutions, and for making Catholic literature more accessible through the publication of indexes, cataloguing tools, reading lists, and the celebration of an annual National Catholic Book week. The association was formed in 1921 as the library section of the National Catholic Educational association; in 1931 it became an independent body and in 1936 was incorporated. Membership at the end of 1942 was 1,000.

In 1942 the 19th annual conference was held in Milwaukee, Wis., June 24–26. The connection between morale and the type of reading done by civilians and soldiers was the theme. For distribution to U.S.O. houses, camp libraries, training school and public libraries, a *Victory Book List* of recommended titles, chiefly recreational, was compiled by the Defense Activities committee of the C.L.A.

During the year the C.L.A. co-operated in forming the Council of National Library associations, an advisory group for collaboration and exchange of information on projects among U.S. library organizations working in various fields. Two regional units, the Detroit (lower Michigan) and mid-South (Tennessee), were added in 1942 to the 16 already existing local divisions of the C.L.A. A high school section was inaugurated, and also an elementary school committee to make a survey of library needs in Catholic primary schools. A Latin-American Libraries committee was established to direct policies on relations with libraries in Spanish and Portuguese-speaking countries of the hemisphere.

Publications during 1942 were: the quarterly issues and a one and one-half year cumulation of the *Catholic Periodical Index* (a four and one-half year cumulation, Jan. 1939 to June 1943, was scheduled for issue in 1943); eight additions to the bio-bibliographical pamphlet series, *Contemporary Catholic Authors;* the official organ, the *Catholic Library World* (1929–), published monthly from October to May. Officers for 1941–43 were: Rev. Thomas J. Shanahan, St. Paul seminary, St. Paul, Minn., president; Rev. Andrew L. Bouwhuis, S.J., Canisius college, Buffalo, N.Y., vice-president; Dorothy E. Lynn, University of Scranton, Scranton, Pa., secretary-treasurer.

Official headquarters of the C.L.A. are at the office of the secretary-treasurer. (T. J. S.)

Catholic Rural Life Conference, National.

A national organization of bishops, priests and lay persons, founded in 1923, and dedicated to the economic, social and spiritual interests of the U.S. farmer. The aims of the conference were listed as follows: (1) to care for the underprivileged Catholics living on the land; (2) to keep Catholics on the land; (3) to settle more Catholics on the land; (4) to convert the non-Catholics on the land.

The 20th annual convention was held at Peoria, Ill., in Oct. 1942. About 4,000 attended the sessions, including 12 bishops, more than 500 priests, professors, rural-life directors, farm leaders, students, etc. Delegates were present from 42 states. Most notable feature was the joint luncheon conference held with 60 non-Catholic rural-life leaders, clergy and lay, presided over by Bishop Muench of Fargo, N.D.

The war activities of the conference included co-operation with governmental and other agencies in the war effort, particularly in urging greater production, and planning for the postwar period. Four rural-life summer schools were held during 1942, with an enrolment of 214 priests, sisters and laymen. Forty-two dioceses, 15 religious orders and 27 states were represented.

The Most Rev. Aloysius J. Muench, bishop of Fargo, N.D., was re-elected president, and the Rt. Rev. L. G. Ligutti was reappointed executive secretary. The official publication, *Land and Home,* appeared in Feb. 1942. Permanent headquarters were established at 3801 Grand ave., Des Moines, Ia. (J. LaF.)

Catholic Welfare Conference, National.

The conference was founded under the authority of the bishops of the United States in Nov. 1919, to unify, co-ordinate and organize the Catholic people of the United States in works of education, social welfare, immigrant aid and other activities.

The 24th annual convention of the conference was held at Washington, D.C., Nov. 11–13, 1942 and was attended by 102 members of the hierarchy. Officers elected to the administrative board were: chairman of the administrative board and executive department, Most Rev. Edward Mooney, archbishop of Detroit, Mich.; vice-chairman and treasurer, Most Rev. Samuel A. Stritch, archbishop of Chicago, Ill.; secretary, Most Rev. Francis J. Spellman, archbishop of New York, N.Y.

The assembled archbishops and bishops at Washington on Nov. 13 stated the position of the Catholics of the United States regarding World War II. The hierarchy declared that the United States had been forced into the most devastating war of all times, and that the conflict of principles made any compromise impossible.

In Sept. 1942 the N.C.W.C. sponsored an inter-American seminar of social studies, attended by 15 representatives from eight central and South-American republics, four delegates from Canada, and ten representatives of the United States. Twenty-six meetings were held in Washington, Detroit, Chicago, Buffalo and New York city.

The report for 1942 gave some idea of the work of the different departments of the conference. The department of lay organization, composed of the National Council of Catholic Women and the National Council of Catholic Men, collaborated with national war services, the chaplains' fund, the Red Cross and other activities. In the department of education most of the work was directed to war problems of U.S. schools, particularly the high schools and colleges. The youth department faced new problems caused by long working hours and high wages—a condition the reverse of that faced in 1941. The press department developed *Noticias Catolicas,* a Spanish-language news service to Latin-American countries, and in addition served 183 newspapers in 29 countries. The legal department was mostly engaged with problems arising out of the dislocations of war. The department of social action, in addition to social welfare work, gave assistance to various governmental boards and committees, and appeared before congressional committees for or against proposed legislation.

National offices are located at 1312 Massachusetts ave., N.W., Washington, D.C. The N.C.W.C. issues a monthly publication, *Catholic Action.* (J. LaF.)

Catholic Youth Organization.

The Catholic Youth organization (CYO) was established in Chicago in 1930. Its founder was Bishop Bernard J. Sheil, auxiliary bishop and vicar-general to Cardinal Mundelein. At the time of its founding in the beginning of the economic depression of 1929, the CYO's primary objective—an objective that still remained fundamental in 1942 despite the broader social-conscious complexion of the CYO program—was to promote among Catholic youth a recreational and religious program that would adequately meet the physical and spiritual needs of out-of-school Catholic boys and girls.

Stemming from a purely democratic ideal, the CYO was dedicated to the principle that boys and girls recognize no religious or ideological cause that fails to be rooted in Christian democratic heritage. To implement its program of education, the CYO early in 1942 organized a School of Social Studies, with the declared purpose of developing an intelligent, well-informed democratic leadership in the community. The school was opened free to both Catholics and non-Catholics. Among the timely courses offered were "Women in Wartime," "Social Pathology," "The Negro in America," "Political Geography" and "Labour." A library, with timely books on important questions of the day, and a reading room were placed at the disposal of the students and the general public.

Among the institutions maintained by the Chicago CYO as of 1942 for the benefit of its youthful members were the CYO-Lewis School of Aeronautics, the CYO West Side Community centre, the CYO hotels for youthful parolees and transients, the CYO Working Boys' home and Friendship House. Numerous activities were sponsored, including classes in radio technique and radio dramatics, study clubs for social action, gliding, boxing, speed ice skating, baseball, softball, outdoor camps for needy youngsters and vacation schools during the summer months.

Also in 1942, as part of its community work, a member of the CYO professional staff was loaned to the Office of Civilian Defense to plan and organize the American Youth Reserve program, the officially-sponsored OCD program for all youth groups in the Chicago metropolitan area. (B. J. S.)

Cattle.

The number of cattle and calves on U.S. farms Jan. 1, 1943, was the largest on record despite the heavy slaughter of 1942. Preliminary estimates placed the number at 76,200,000, the peak of a steady rise that began in 1938 following the drought years in which many breeding herds were depleted because of scarcity of feed. The number of cattle and calves Jan. 1, 1942, was 74,600,000. The calf crop in 1942 was 32,000,000 compared to 31,000,000 in 1941. Imports of cattle in 1942 were 600,000 head, a drop of 100,000 under 1941.

During 1942, ceiling prices for beef were announced in April, and the strong competition among packers for cattle for immediate slaughter tended to support relatively high prices for feeder cattle in comparison with prices for fat cattle. In other words, if prices for feeders were relatively high, owing to the demand for carcass beef and lower grades for sausage and canning, and if prices for finished fat cattle were relatively low, then there would be little inducement for corn belt feed lots to buy high-priced feeders to convert to relatively low-priced fat cattle. This situation caused some hesitancy among cattle feeders to undertake usual autumn operations. The department of agriculture contended, however, that the spread between feeders and fat cattle was as favourable in 1942 as on the average during the previous 15 years. Restricted deliveries of beef to retailers were put into effect in the autumn of 1942, and the supply of beef for civilian consumption was markedly reduced, as compared to pork. Meat consumption by the United States military forces called for somewhat larger supplies of beef than of pork. The U.S. army in 1942 was purchasing meat at the rate of about 300 lb. a year for each soldier. U.S. civilian consumption of meat was 140 lb. per capita in 1940. For slaughter of cattle in 1942 *see* MEAT. (*See* also LIVESTOCK.) (S. O. R.)

Cement.

The war program, with its extensive military, industrial and housing construction, greatly increased the demand for cement, so that production increased 6% over the preceding year in 1940 and 26% in 1941, when the output included 164,030,559 bbl. of portland cement and 2,875,962 bbl. of special cements, a total of 166,906,521 bbl. Even with this heavy increase in output, demand continued to lead, and shipments for 1941 were 167,439,237 bbl., while consumption, including imports, was of the order of 169,000,000 bbl. Consequently at the end of 1941 stocks had declined to 24,406,606 bbl. (including 19,995,979 bbl. of finished cement, 4,575,000 bbl. of clinker and 209,627 bbl. of special cements) as compared with 28,510,525 bbl. in 1940. There was sufficient surplus capacity in the industry to cover any probable increase in demand, since the 167 plants contributing to the 1941 output were worked only at an average of 65%.

Normally the distribution of cement is highly seasonal, with shipments usually reaching a peak in midsummer, and a low in midwinter, with the peak as much as two to three times as great as the low. Because of the pressure for rapid completion of the work that characterized recent expansions in building construction, winter construction was increased, the low of Feb. 1942 being 8,293,000 bbl., as compared with 3,893,000 bbl. in Jan. 1940. The demand for speed in construction also manifested itself in the proportion of high-early-strength cement turned out, this type having increased by 39% in 1941, with 6,123,224 bbl. (*See* also GYPSUM.) (G. A. Ro.)

Censorship.

Censorship is a vital offensive and defensive weapon of modern warfare. Its function is to attack the communications of the enemy, to prevent important information from reaching him, and at the same time to intercept all possible information about his plans. For that reason the United States government, following the example of all other belligerents, maintained a careful examination of communications crossing its borders ever since the Japanese attack on Pearl Harbor.

This border censorship of letters, cablegrams, radiograms and telephone calls was authorized by congress in the First War Powers act. President Roosevelt's executive order establishing the Office of Censorship on Dec. 19, 1941, conferred upon the director "absolute discretion" in censoring international communications. The president also asked the director to assist American newspapers, periodicals and radio stations in voluntarily preventing the circulation of dangerous military information within the United States itself.

To carry out these assignments, the Office of Censorship quickly organized headquarters in Washington and field stations—for examining the mails and cables—in ports and border cities. These stations were staffed with 13,000 men and women recruited under Civil Service procedure. Their supervisory personnel at first consisted of military and naval intelligence officers who long had been preparing for postal and cable censorship in event of war. These officers were transferred to duty under the civilian

A NEWS DISPATCH OF 1942 from the Solomon Islands, after it had passed through U.S. naval censorship

director, and carried on independently of the war and navy departments. Toward the end of 1942, however, the war department withdrew most of the 150 army officers.

In contrast to the large staff needed for border censorship, supervision of the domestic press and radio self-censorship required only a score of experienced newspapermen and broadcasters. This work cost one-half of one per cent of the $26,500,000 voted by congress for the Office of Censorship.

Because it was established as a war agency, the Office of Censorship took the position that it was concerned only with information relating to the war. The United States had no peacetime censorship. Domestically, no attempt was made by the Office of Censorship to curtail the expression of personal or editorial opinion, as long, of course, as the seditious stage was not reached. But the censors outlined types of information which would be valuable to the enemy, and all such information, unless officially announced, was deleted from communications leaving the United States.

Heading the list of restricted material were movements of naval and merchant vessels and of troop units. Unauthorized disclosure of the location of fortifications and of the strength of the air forces also was prohibited. Details about the ever-increasing output of munitions, tanks, planes and other military equipment usually had to be withheld because the facts would enable the enemy to gauge the speed of U.S. war production. Less obvious were the reasons for banning such items as unofficial weather forecasts; a United States naval officer in the North Atlantic had found that by listening to the forecasts given by a small midwest radio station he could plot the weather over the ocean for the next few days. A German submarine commander could, of course, do the same.

All such material, often written innocently by loyal Americans, either had to be excised or the letters returned to the senders. Communications were not permitted, either directly or indirectly with enemy-held territory, except in two instances: brief message could be sent to prisoners of war, and 25-word personal letter could be sent to relatives through the Red Cross. Normally censorship did not delay a letter more than 24 hours, although transportation schedules were so disrupted that the international mail did not move very rapidly. Cablegrams often were censored within a few minutes after they were filed, because it is as necessary for a country to keep its own communication lines open fo legitimate business as it is to disrupt the enemy's channels.

Most Americans accepted censorship philosophically. The principal public objection was raised by Gov. Ernest Gruening o Alaska before the Senate Judiciary committee during consideration of a bill to outline by statute the scope of censorship between continental United States and its territories and possessions. This form of censorship had been carried on as a military necessity under the president's authority as commander in chief, but Governor Gruening wanted restrictions written into the statute. At a hearing on the legislation, representatives of federal intelligence agencies declared that censorship had uncovered much valuable military information. Following censorship's location of contact used by axis agents in the Caribbean region, a naval officer testified, there was a decrease in the number of ship sinkings in tha area.

Action on the legislation was put over until the 1943 session o congress.

American editors and broadcasters co-operated wholeheartedly with the Office of Censorship in living up to Codes of Wartime Practices listing types of information which the enemy would like to have and which therefore should not be circulated. This voluntary censorship actually was the heart of the whole censorship program, inasmuch as any information widely disseminated in th United States undoubtedly could not be kept from the axis. Th Code provisions, in general, were similar to the types of restricted material in border censorship. The Codes were based on th principle that any information officially disclosed by a government agency or representative could be printed; the Office o Censorship did not undertake to censor the government.

The success of this voluntary method of withholding publication of news until security no longer was endangered was demonstrated in such instances as the visit to Washington of Premier Molotov of Russia and President Roosevelt's unpublicized cross country tour of war plants. These trips were not announced by the White House until the participants had returned home safely

Census, 1940. The sixteenth decennial census of the United States, taken as of April 1, 1940, covered a decidedly wider field than prior censuses. The schedules contained about 70 questions, of which nearly 30 were on the special schedule for housing. Some of the questions, however, were asked of only 1 person in 20, and many tabulations have been made on the basis of this 5% sample. The use of the sample has made possible not only the inclusion of additional questions in the enumeration, but also the tabulation of many detailed cross-classifications which would have been out of the question on a 100% basis.

POPULATION AND HOUSING

Growth of Total Population.—Under existing conditions, with no adequate basis available for evaluating the unusual migration from one place to another within the United States since 1940, it has not been possible to make very satisfactory postcensal estimates for states or counties. Reliable estimates of the population of the United States as a whole, however, have been made by the bureau of the census on the basis of current records of births and deaths (corrected for under-registration) and net immigration. Since these current figures are available on a monthly basis, it has been possible to make these estimates of the population of the United States for each month down to Jan. 1, 1942. These estimates, which are presented in Table I, make no allowance for postcensal movements of the armed forces away from continental United States. (The estimates are presented to the last digit as computed, instead of being rounded, not because they are assumed to be accurate to the last digit, but for convenience in summation.)

The population of continental United States on Jan. 1, 1942, according to the estimates, was 133,965,237, which represents an increase of 1,327,304 over the population estimated for Jan. 1, 1941. The increase during the calendar year 1941 was thus almost 50% greater than the average annual increase between 1930 and 1940. The rate of increase for 1941 was 1.0%, as compared with an average annual rate of 0.7% for the decade 1930 to 1940.

The recent acceleration of population growth results mainly from a rise in the birth rate. During the calendar year 1941 there were approximately 2,728,000 births, as compared with an annual average of about 2,319,000 between 1930 and 1940. This increase in the birth rate has taken place since 1936, following an almost continuous decline since 1921, and is attributable mainly to the business prosperity induced by defense activities, and to the anticipation of conscription and the entry of the United States into World War II. A record marriage rate led to more first births and the number of children born to couples married earlier also increased. The number of deaths in 1941, on the other hand, was about the same as the annual average during the decade from 1930 to 1940.

On a relative basis, there was a marked change in the contribution to population growth represented by immigration from foreign countries. During 1941 there was a net civilian immigration of 40,825 as compared with an average net emigration of about 5,000 during the preceding census period. Even this figure, however, represents a very small fraction of the increase in population during the year 1941.

The sources of the increase in population from one month to the next are indicated by the figures in the last four columns of Table I.

In view of the probable future course of the factors determining population change, the prospects of continued growth at the 1941 rate seem rather slight. Immigration is expected practically to cease for the duration of the war; and with several million men in the armed forces, many of them stationed abroad, the birth rate is likely to drop abruptly, as it did during World War I. The civilian death rate will probably not increase appreciably in 1943, but military mortality is likely to become an important factor. The rate of population growth, therefore, is likely to decline as World War II proceeds.

Nativity and Parentage.—The white population of the United States formed almost nine-tenths (89.8%) of the total population both in 1940 and 1930. The distribution of the white population by nativity and parentage, however, changed very materially during the intercensal period. The number of foreign-born white decreased from 13,983,405 in 1930 to 11,419,138 in 1940, or 18.3%. The native white population increased during the same period from 96,303,335 to 106,795,732, or 10.9%. This increase, amounting to 10,492,397, exceeded by more than 1,500,000 the increase in the total population.

The native white population is further classified on the basis of nativity of parents, first, into two groups, (1) persons of native parentage and (2) persons of foreign or mixed parentage The second group is then further subdivided into those having

Table II.—*White Population by Nativity and Parentage, 1940 and 1930*

(Parentage classification for 1940 based on a tabulation of a 5% sample, adjusted to the total for native white)
(A minus sign [−] denotes decrease)

Nativity and parentage	Number		Per cent of increase 1930–40	Per cent of total	
	1940	1930		1940	1930
Total	118,214,870	110,286,740	7.2	100.0	100.0
Native white	106,795,732	96,303,335	10.9	90.3	87.3
Native parentage	83,743,202	70,400,952	19.0	70.8	63.8
Foreign or mixed parentage	23,052,530	25,902,383	−11.0	19.5	23.5
Foreign parentage	15,114,858	17.407,527	−13.2	12.8	15.8
Mixed parentage	7,937,672	8,494,856	−6.6	6.7	7.7
Father foreign	5,243,250	5,547,325	−5.5	4.4	5.0
Mother foreign	2,694,422	2,947,531	−8.6	2.3	2.7
Foreign-born white	11,419,138	13.983,405	−18.3	9.7	12.7

both parents foreign born and those having one parent foreign born and the other native. This classification is shown in full detail in Table II.

The number of native white persons of native parentage increased 19.0% between 1930 and 1940, while the whole number of persons of foreign or mixed parentage decreased 11.0%, and those of foreign parentage, taken alone, decreased 13.2%. The changes in the proportion of the total white population represented by these various classes are perhaps even more significant than the changes in the absolute numbers. The percentage of the white population which was foreign born decreased from 12.7 in 1930 to 9.7 in 1940, and the percentage represented by native persons of foreign or mixed parentage decreased from 23.5 to 19.5, with corresponding increases in the percentages representing all native persons and natives of native parentage.

The decline in the proportion of foreign born is, of course, the direct result of the practical cessation of immigration from foreign countries. The decline in the numbers of native persons of foreign or mixed parentage indicates that even the children of earlier immigrants are reaching the ages of heavy mortality and that because the foreign born are for the most part past the reproductive ages, there have been few children to provide replacements at the lower end of the age scale.

Foreign White Stock.—The term "foreign white stock" is used in the census reports to indicate the combined total of two classes, namely, the foreign-born white and the native white of foreign or mixed parentage. The classification therefore includes only those persons who were born abroad (sometimes referred to as the first generation) and those who have at least one parent foreign born (the second generation) but not the third and later generations of persons of foreign ancestry—though in some instances these later generations may retain many of the characteristics of the original immigrant.

In 1940 the foreign white stock numbered about 34,600,000, or a little over one-quarter of the total population of the United States. About 11,400,000, or roughly one-third, of this number were foreign born. Of the remaining 23,000,000, about 15,000,000 were persons with both parents foreign born; 5,000,000 had only the father foreign born, and something less than 3,000,000 had only the mother foreign born.

The foreign white stock is classified by country of origin in Table III. In this table the foreign born are classified by country of birth. Those with both parents or with father alone foreign born are classified by country of birth of father, and those with mother alone foreign born, by country of birth of mother. The 1940 classification is based on the political boundaries of the countries as they were on Jan. 1, 1937, at which time they were practically the same as in 1930.

The figures presented in Table III for the native white of foreign or mixed parentage are those obtained from the 5% sample tabulation. The total thus differs slightly from the corresponding total shown in Table II, since it has not seemed practicable to adjust the results of the detailed tabulation by country of origin. The statistics based on the sample tabulation are expected to differ somewhat from those which would have been obtained from a count of 100% of the population. A measure of the extent of this difference has been obtained by analyzing the data for certain classifications obtained both from the sample and from a 100% tabulation. This analysis indicates that in 95% of the cases the sample statistics differ from the complete census statistics by less than 5% for all numbers of 10,000 or more, with the probability of closer and closer agreement as the numbers become larger and larger. Numbers smaller than 10,000 are conversely subject to the possibility of greater variations.[1]

Table III.—*Foreign White Stock by Country of Origin, 1940 and 1930*

(1940 statistics for native white of foreign or mixed parentage based on a tabulation of a 5% sample, multiplied uniformly by 20)

[1] The nativity classification based on the 5% sample, from which figures are presented in Tables III and IV, is subject to an additional bias, growing out of one of the mechanical processes of the tabulation, as a result of which the United States total for foreign-born white in the sample tabulation exceeds the figure from the complete tabulation by decidedly more than the maximum sample variation.

The figures for all of the countries in northwestern Europe ndicate very considerable decreases in the foreign white stock of oth first and second generations from these countries. These elatively high rates of decrease are to be explained mainly by he fact that the bulk of the immigrants from these countries rrived in the United States earlier than those from most other egions of Europe. The foreign born in particular from these ountries are now concentrated in the older age groups, where the ate of mortality is high. Similar rates of decrease are likewise hown for Germany, Poland and other countries in central Europe.

In general, the countries of eastern Europe show smaller delines in foreign white stock and several of the south European ountries, including Greece, Italy and Portugal, show small inreases. These increases were confined to the second generation f the foreign white stock, however, since immigration during the ecade 1930 to 1940 was drastically reduced by the quota laws nd by the economic depression. Immigrants from southern Euope, however, are comparatively late arrivals, and the second eneration is still relatively young.

In spite of a decline in both nativity groups, the German forign white stock continued to be the largest, numbering 5,236,612, r about one-seventh of the total foreign white stock in 1940. Next in order was the Italian stock, with 4,594,780, or about oneighth of the total. Other countries contributing more than 2,000,oo were Canada, Poland, Russia and the Irish Free State, with England just under this limit. (*See* also ALIENS; IMMIGRATION ND EMIGRATION, U.S.)

Mother Tongue.—Mother tongue is defined as the principal anguage spoken in the home of the person in his earliest childood. English was reported as the mother tongue only if no forign language was spoken. While at many points the classification y mother tongue runs parallel with that by country of origin, it hould be noted that the mother tongue is not necessarily the ame as the language of the country in which the person or his ncestors were born. For example, many persons of German nother tongue were born in Russia. The 1940 figures presented n Table IV represent the first tabulation by mother tongue that as covered the entire native white population as well as the forign born. All of the figures in Table IV are based on the 5% ample tabulation, without adjustment, and the totals therefore iffer slightly from those shown for corresponding classes in Table II. The category "English" includes persons who reported rish, Scotch, or Welsh as their mother tongue. A large proporion of these probably spoke a dialect of English, however, rather han the distinctive Gaelic language of their ancestors, and the umber thus included whose mother tongue was other than Engish is very small.

There were about 22,000,000 persons in all in the United States vith a mother tongue other than English, including about 8,500,oo foreign born, 11,000,000 natives of foreign or mixed parentge, and almost 3,000,000 natives of native parentage.

Nearly 5,000,000 persons in the United States reported German s their mother tongue in 1940, including 925,040 persons of the hird and later generations (persons not included in the foreign vhite stock shown in Table III). Italian was the next most important among the non-English mother tongues, with 3,766,820 ersons reporting, of whom 125,040 were of the third and later enerations; and Polish was third, with 2,416,320 in all, and 185,320 beyond the second generation. Of the 1,861,400 persons reorting Spanish mother tongue, most of whom were of Mexican rigin, 718,980, or nearly 40%, were of third and later geneations. Of the 1,412,060 persons of French mother tongue, 518,780, or more than one-third, were of generations beyond the secnd. Most of these were, of course, French Canadians, though a onsiderable number was contributed by the French stock in Louisiana.

Table IV.—*Mother Tongue of the White Population of the United States by Nativity and Parentage, 1940*

(Statistics based on a tabulation of a 5% sample, multiplied uniformly by 20)

Mother tongue	Total	Foreign born	Native of foreign or mixed parentage	Native of native parentage

California	215,200	101,440	105,760	8,000
Other States	333,740	135,020	179,760	18,960

The population of Spanish mother tongue is largely concentrated in California, Texas and other states of the southwest, these being the areas into which there has been the most extensive immigration from Mexico. The 221,740 persons of Spanish mother tongue in New Mexico represented more than 40% of the entire population of the state, a much larger percentage than in any other state, though the 101,880 persons of Spanish mother tongue in Arizona represented 20% of that state's total population. In both New Mexico and Colorado it may be noted the Spanish-speaking population classified as native white of native parentage far exceeds the number of those representing the first and second generations of immigration from Mexico.

75 years and over	1,301,420	125,160	9.6	239,520	18.4	931,920	71.6	4,820

The population of German mother tongue is very widely distributed, there being 16 states, ranging from New York to California, in which the numbers exceeded 100,000. The two states in which the persistence of German mother tongue beyond the second generation is indicated by rather large figures for persons of native parentage are Pennsylvania and Wisconsin. The figures for Pennsylvania doubtless represent mainly the so-called "Pennsylvania Dutch" (actually of German or Swiss descent), who have been in the United States for six or seven generations.

The Italian-speaking population, on the other hand, is rather closely concentrated, nearly six-tenths of the total being in three adjacent states, New York, New Jersey and Pennsylvania. Partly perhaps because the Italians represent a relatively "new" immigration, most of the persons reporting Italian mother tongue are either foreign born or the children of foreign born.

Marital Status.—Of the white male population 15 years old and over, as returned in the 1940 census, 61.4% were married and 5.5% widowed or divorced; of the female population 61.1% were married and 12.7% widowed or divorced. The percentage married for males shows a continuous increase since 1890, the date of the first census for which these data are available, and the percentage married for females presents a similar continuous increase except for a nominal decrease (from 61.4 to 61.1) between 1930 and 1940, due entirely to changes in the figures for the foreign born, since the native white females alone show an appreciable increase.

While the figures representing the marital status of the entire male or female population 15 years old and over are convenient for many uses, the classification becomes much more significant if it is made in combination with age. The proportion married increases very rapidly during the 15 or 20 years immediately following the attainment of age 15; and during the last 25 or 30 years of the normal age range the percentage widowed increases so rapidly that in the case of females it becomes the dominant class. Figures for the 1940 white population classified by marital status in combination with age are presented in Table VI.

Of the male population 15 to 19 years old only 1.6% were married, according to the 1940 returns, as compared with 26.1% in the age group 20 to 24, and 62.2% in the age group 25 to 29. Of the females 15 to 19 years old, 10.7% were married, as compared with 50.0% in the next age group, and 74.0% of those 25 to 29 years old. These relatively higher percentages for females result from the appreciably lower age at marriage for women as compared with men.

Incidentally, it may be noted that contrary to the usual assumption of an increasing age at marriage, the figures representing the proportion married by age from the several censuses, beginning with 1890, show an appreciable, though not rapid, decline in the average age at marriage for both males and females.

Up to age 40 or 45 the proportion of the population widowed remains too small to be of great significance. In fact, for males the proportion widowed does not reach 10% until after age 60. For females, however, 9.5% of the group 45 to 49 years were widowed, and in the age group 70 to 74, 54.4% were widowed as compared with 34.9% married and 9.8% single. (*See* also MARRIAGE AND DIVORCE.)

Wage or Salary Income.—In the 1940 population census were included two questions on income, which applied to all persons 14 years old and over except inmates of specified institutions. The main question called for the amount of money wage or salary income received in 1939. This was supplemented by a second question which asked whether or not income amounting to $50 or more was received in 1939 from sources other than money wages or salaries. The purpose of the second question was to identify for separate tabulation those for whom wages or salaries constituted practically the entire income.

The income question was limited to wages and salaries in order to simplify the work of the enumerator, it being assumed that this information could be obtained much more readily than information on farm income, business profits, or receipts from other sources. In short, it was felt that a question on total income would be far too difficult to be handled as a part of a census enumeration.

Wage or salary income was defined as including all money received in compensation for work or services performed as an employee, including commissions, tips, piece-rate payments, bonuses, etc., as well as those receipts commonly referred to as wages or salaries. The value of income received in kind, such as living quarters, meals, clothing, etc., was not included.

The most significant of the returns from the income question are those relating to persons classified as wage or salary workers, omitting those on public emergency work. Income data for this class, which formed nearly three-fourths of the entire labour

Table VII.—*Wage or Salary Income and Receipt of Other Income in 1939 for Persons Who Were Wage or Salary Workers in March, 1940 (Excluding Those on Public Emergency Work), by Sex, for the United States*

(Statistics based on a tabulation of a 5% sample, multiplied uniformly by 20)

Median wage or salary income for all workers reporting:						
Total	$800	—	$833	—	$605	—
Male	967	—	1,002	—	741	—
Female	540	—	571	—	337	—
Median wage or salary income for workers with $1 or more:						
Total	$877	—	$885	—	$817	—
Male	1,038	—	1,046	—	972	—
Female	610	—	621	—	516	—

Includes workers not reporting whether or not they received other income of $50 or more —about 800,000 in all.

orce, are presented in Table VII. Wage or salary workers are lefined as persons who in their current or last job worked as mployees for wages or salaries. The category includes both private wage or salary workers and nonemergency government vorkers.

The fact that a number of wage or salary workers were reported as receiving no money wage or salary income in 1939 is he result of several different factors. About two-fifths of this group reported the receipt of other income and thus might have eceived all their income in kind or might have been working on heir own account in 1939. The remainder of the number shown s with no wage or salary income represents mainly those who vere unemployed or outside the labour force in 1939, perhaps ncluding also some whose income or class-of-worker designation vas incorrectly reported. Those who failed to make any report n income were relatively few, constituting only 2.3% of all vage or salary workers.

The considerable range of income is indicated by the fact that about one-fourth of the workers reported incomes of $1,400 or more and a little more than one-fourth reported incomes below $400. Those who received $5,000 and over constituted only 1.0% of the total and those with from $1 to $99 only 3.4%.

A very convenient statistical device for summarizing the income distributions is the median, which may be defined as that amount which divides the total group of workers into two equal parts, one having incomes above the median and the other incomes below. In the group of workers without other income of $50 or more, the median wage or salary income was $1,002 for men and $571 for women, each figure being about $30 greater than the corresponding figure for all workers, including those with other income. These figures apply to all wage or salary workers without regard to occupation or amount of time worked, so they cannot by any means be used as an indication of differences in pay scales for men and women doing the same work.

Medians have also been computed for those workers receiving $1 or more. The omission of the marginal group reporting zero income raises the median for men to $1,046 and for women to $621.

The median wage or salary income of all workers who received nonwage income of $50 or more was $605, as compared with $833 for workers who had no other income. The proportions of those receiving nonwage income who were in either the low or the high income brackets were considerably greater than the corresponding proportions for those without such income. Wage or salary incomes of less than $400 were reported by 40.4% of the workers receiving nonwage income of $50 or more, as compared with 26.0% of the workers without other income, and incomes of $2,500 or more were reported by 8.6% of the former as compared with 4.9% of the latter. For persons at the lower end of the wage or salary income scale, nonwage income consisted primarily of direct relief payments and of income in kind, such as food, clothing and lodging, whereas for persons at the upper end of the scale it consisted mainly of rents, interest, dividends and profits. (*See* also WEALTH AND INCOME, U.S. DISTRIBUTION OF; WAGES AND HOURS.)

Metropolitan Districts.—Prior to 1940 census statistics were presented almost exclusively for geographic areas with legally established political boundaries, that is, for states, counties, townships and cities. To an increasing extent, however, the population tributary to a fairly large city is expanding into the area outside the incorporated limits of the city. There has grown up, therefore, an increasing demand for statistics relating to this entire area, including both the city and the thickly settled adjacent suburban area. Some steps were taken toward meeting this demand as early as 1910 when metropolitan districts were established for 25 of the largest cities and tables were presented giving the population of these areas, with separate figures for the central city and that part of the district outside. Similar tables, giving the total population of each district and its constituent parts (cities, townships, etc.), were published in 1920. In 1930 the number of metropolitan districts was increased to 96; and a brief classification was published showing the population by sex, colour and age for all the incorporated places and townships or other political subdivisions making up each district. For the census of 1940, districts were established for all cities which had a population of 50,000 or more in 1930, and almost all of the important classifications presented in the census reports on population and housing are shown for the metropolitan districts—or at least for the more important ones—as well as for the central cities. This represents an expansion in the geographic classification of the census figures perhaps even more important than the very great extension in the use of urban-rural areas which was incorporated in the reports of the 1930 census.

The general plan followed in setting up the metropolitan districts has been to include in the district, in addition to the central city or cities, all adjacent and contiguous townships or other minor civil divisions and incorporated places having a population of 150 or more per square mile. A metropolitan district is thus not a political unit but rather an area including all the thickly settled territory in and around a city or group of cities. It tends to be a more or less integrated area, with common economic, social and often administrative interests.

The 50 metropolitan districts having a population of 250,000 or more are listed in Table VIII, which gives separately the population of the central city and the outside area in each district.

As indicated by the figures in the last column of Table VIII, there is a wide diversity among the cities in the relation between the population of the central city and the population outside, the difference representing mainly actual differences in the composition of the territory immediately surrounding the city. In the Boston metropolitan district, on the one hand, 67.2% of the population is outside the central city, the outside area in this case including a number of other cities of considerable size. At the other extreme, among the districts of 250,000 or more, is the Omaha-Council Bluffs district, in which only 7.8% of the population is in the outside area, which consists mainly of a rather small number of townships with no incorporated areas except two small villages. The Pittsburgh metropolitan district is another in which a very large part (66.3%) of the total population lies outside the central city, while New Orleans, with 8.4% outside, and Memphis, with 11.9% outside, are examples of metropolitan districts established in areas where the near-by population outside the city was relatively unimportant.

Vacant dwelling units	2,470,938	1,019,852	915,364	535,722
Per cent of all units vacant	6.6	4.7	11.3	7.0
Per cent of occupied units owner-occupied	43.6	37.5	51.7	53.2

The Housing Census.—The census of housing was an integral part of the census of population, taken at the same time and by the same enumerators. The housing data were recorded on a separate schedule, to which had been transferred a number of items previously carried on the population schedule, such as tenure and value or rent of home, and size of family or household. These were supplemented by questions with respect to the physical characteristics and equipment of the homes. The basis of most of the housing census tabulations is the dwelling unit, defined as the living quarters occupied by one family or household (or intended for such occupancy). The dwelling unit is thus practically the same as the "home," for which figures are shown in earlier census reports. (*See* also HOUSING.)

Occupancy and Tenure.—Dwelling units are classified, first as occupied and vacant; then the occupied units are further classified as owner-occupied and tenant-occupied. A dwelling unit was classified as owner-occupied if it was owned either wholly or in part by the head of the household or by some related member of his family living in the dwelling unit. All other occupied units were classified as tenant-occupied, even though no cash rent was paid for the living quarters. Table IX shows the whole number of dwelling units in the United States classified by occupancy and tenure, with separate figures for urban and rural areas.

Of the 37,325,470 dwelling units in continental United States in 1940, 2,470,938, or 6.6%, were returned as vacant. The number of vacant units includes, however, 606,555 which were not on the market either for sale or for rent, being for the most part reserved for absent families, etc. Nearly two-thirds of these, however, were seasonal dwellings, many of them suited only for summer occupancy. The 1,864,383 dwelling units vacant and for sale or rent likewise included considerable numbers of seasonal units (341,831 in all), especially in rural areas. If these are deducted, the remaining number of year-round dwelling units on the market is reduced to a figure representing only 4.1% of the grand total.

Of the occupied dwelling units 43.6% were occupied by owners and 56.4% by tenants. The percentage occupied by owners in urban areas was 37.5, in rural-nonfarm, 51.7, and in rural-farm 53.2. These figures are in all cases materially lower than the corresponding figures returned for homes in 1930, this bein especially the case with the urban figure.

Value and Monthly Rent.—The census enumerator was instructed to obtain for each owner-occupied dwelling unit the estimated current market value of the home, and for each tenant-occupied unit, the monthly rent, or, if no rent was actually paid, the estimated monthly rental value. For an owner-occupied unit which formed only a part of the structure in which it was located, the value returned was to represent only a proportional part of the total value of the structure. The data for owner-occupied units classified by value are presented in Table X, and for tenant-occupied units classified by monthly rent in Table XI. These tables also present average and median values and rentals, the median being the value of the unit which would stand in the middle of the series if all the units were arranged in order according to value. The medians are in all cases materially lower than the averages, since the latter are pushed upward by the weight of small numbers of homes with very high values, while in the computation of the median a home valued at $20,000 or more has no more weight than one valued at $200.

In the United States as a whole the owner-occupied dwelling units are rather widely distributed on the basis of value, all of the groups shown in the table with values up to $7,500 being represented by approximately 5% or more of the total, the maximum group, that comprising homes valued from $3,000 to $3,999, containing only 13.3%. This even distribution disappears, however, when the total is subdivided into geographic areas. In fact, the subdivision of the United States into urban and rural areas covering the country as a whole results in an urban series with relatively few dwelling units valued at less than $1,000 and appreciable numbers over $10,000, while in the rural-farm area almost half of the owner-occupied units were returned with a value of less than $1,000 and two-thirds with a value of less than $1,500. These urban-rural differentials are brought out more clearly, perhaps, by the median values, which were for the urban, $3,501, for the rural-nonfarm, $1,715, and for the rural-farm, $1,028.

Table X.—*Owner-Occupied Dwelling Units by Value, for the United States, Urban and Rural, 1940*

Value	Total		Per cent, average and median, urban and rural		
	Number	Per cent	Urban	Rural-nonfarm	Rural-farm

Median Number of Rooms					
United States, total	4.73	—	4.78	4.61	4.70
Owner-occupied	5.58	—	5.72	5.24	5.51
Tenant-occupied	4.11	—	4.13	4.05	4.07
The north, total	5.17	—	4.99	5.26	6.15
Owner-occupied	5.95	—	5.91	5.73	6.45
Tenant-occupied	4.56	—	4.40	4.85	5.86
The south, total	4.05	—	4.19	4.00	3.98
Owner-occupied	5.03	—	5.41	4.78	4.79
Tenant-occupied	3.51	—	3.46	3.51	3.57
The west, total	4.20	—	4.39	3.83	4.20
Owner-occupied	4.94	—	5.18	4.37	4.68
Tenant-occupied	3.57	—	3.55	3.48	3.84

The range covered by the tenant-occupied dwelling units classified by rent is somewhat narrower, 60% of these units falling between $10 and $39 in monthly rental. Concentration in this range is especially characteristic of the urban units. The rural-nonfarm units show a similar concentration in the rental groups from $3 to $20, and the rural-farm units at an even lower level. The variations in monthly rental as between urban and rural areas are decidedly greater than the corresponding variations in value, the median monthly rental for urban dwelling units being $24.60, for rural-nonfarm units, $10.08, and for rural-farm, $4.72.

Number of Rooms.—In determining the number of rooms in a dwelling unit, all rooms that are used or available for use as living quarters for the household are counted. Bathrooms, closets, pantries, halls, screened porches and unfinished rooms in the basement or attic are omitted. Table XII shows dwelling units classified by number of rooms for the United States as a whole, with percentages and medians for urban and rural areas.

More than seven-tenths of the dwelling units comprised 3, 4, 5, or 6 rooms, the number with 5 rooms being a little larger than the number with 4, and considerably larger than the number with 6. About one-eighth of all the dwelling units, however, contained only 1 or 2 rooms, and at the other end of the scale there were 9.7% which contained 8 rooms or more.

The distribution of dwelling units by number of rooms did not differ radically as between urban and rural-farm areas. For the United States as a whole the median number of rooms in urban dwelling units was 4.78, as compared with 4.70 in rural-farm. In the northern states taken alone, the rural-farm dwelling units were decidedly larger than the urban, while in the southern and western states they were a little smaller.

Owner-occupied dwelling units were in general larger by somewhat more than 1 room than tenant-occupied units, though this does not necessarily mean that they provided more adequate living accommodations. It should be noted, for example, that practically all apartment house units, which tend to contain rather small numbers of rooms, are found in urban areas.

Table XIII—*Dwelling Units by Water Supply, for the United States, Urban and Rural, 1940*

Water supply	Total		Per cent, urban and rural		
	Number	Per cent	Urban	Rural-nonfarm	Rural-farm
All dwelling units	37,325,470	—	—	—	—
Number reporting water supply	36,900,814	100.0	100.0	100.0	100.0
Running water in dwelling unit	25,796,314	69.9	93.5	55.9	17.8
Hand pump in dwelling unit	1,596,089	4.3	0.6	7.7	11.2
Running water within 50 feet	1,533,798	4.2	3.5	5.6	4.4
Other water supply within 50 feet	6,074,676	16.5	1.7	22.7	51.7
No water supply within 50 feet	1,899,937	5.1	0.6	8.1	14.8
Not reporting water supply	424,656	—	—	—	—

Water Supply.—The statistics for water supply obtained in the housing census relate to the principal source of water supply available for household purposes, not necessarily drinking water. "Running water" may be piped from either a pressure or a gravity system. "Other" may include any source of water supply except running water. The data for dwelling units classified according to water supply are summarized in Table XIII.

In the country as a whole nearly seven-tenths of the dwelling units were supplied with running water. This convenience was found in 93.5% of the urban units and in 55.9% of the rural-nonfarm units, these consisting largely of houses in the smaller towns and villages. Of the farm units only 17.8% had running water, with an additional 11.2% reporting a hand pump in the house. This left nearly three-quarters of the rural-farm units without water available in the house, though 56.1% of the whole number reported water available within 50 ft. of the house, presumably, for the most part, from a well in the yard.

Plumbing Equipment.—In the classification of dwelling units in accordance with plumbing equipment two series of data are presented, those representing toilet facilities and those indicating whether or not the home was provided with a bathtub or shower. Figures are presented in Table XIV, with designations which are for the most part self-explanatory.

Flush toilets, like running water, were found to be more often a characteristic of urban dwelling units than of rural, though nearly one-half of the rural-nonfarm (village) units reported flush toilets, as compared with nine-tenths of the urban. Of the rural-farm units, only 11.4% reported flush toilets, this number bearing about the same relation to the number with running water as in the case of urban and rural-nonfarm units.

The percentages of dwelling units in the various areas which were supplied with bathtub or shower likewise follow rather closely the percentages with running water.

Heating Equipment.—The number of dwelling units equipped with various types of heating equipment is shown in Table XV, the most important classification being perhaps that distinguishing those with central heating from those without. One or two items only require explanation. A "pipeless warm-air furnace" is a furnace located in the basement or utility room with no warm-air outlet other than one grille directly above or adjacent to the furnace. The category "heating stove" includes regular heating stoves, circulator heaters with flues and nonportable electric or gas heaters. Dwelling units which have no heating equipment other than portable heaters, fireplaces, or kitchen stoves are included in the category "other or none."

Table XIV.—*Dwelling Units by Plumbing Equipment for the United States, Urban and Rural, 1940*

Plumbing equipment	Total		Per cent, urban and rural		
	Number	Per cent	Urban	Rural-nonfarm	Rural-farm
All dwelling units	37,325,470	—	—	—	—
Toilet Facilities					
Number reporting toilet facilities	36,769,610	100.0	100.0	100.0	100.0
Flush toilet in structure, exclusive use	21,966,878	59.7	83.0	43.2	11.2
Flush toilet in structure, shared	1,826,962	5.0	7.8	1.8	0.2
Nonflush toilet in structure	130,977	0.4	0.1	0.9	0.4
Outside toilet or privy	11,826,429	32.2	8.6	51.2	78.9
No toilet or privy	1,018,364	2.8	0.4	2.9	9.3
Not reporting toilet facilities	555,860	—	—	—	—
Bathtub or Shower

Exclusive use	20,606,386	56.2	77.5	40.8	11.8
Shared	1,722,576	4.7	7.3	1.9	0.2
None	14,320,519	39.1	15.2	57.3	88.0
Not reporting	675,989	—	—	—	—

Of all dwelling units in the United States 42.0% were equipped with central heating, including only a small fraction with the relatively simple pipeless warm-air furnace, and 58.0% were without central heating, four-fifths of these being heated by stoves. Central heating was, of course, much more common in urban areas than in rural-farm, only about one-tenth of the rural-farm units having any form of central heating equipment.

Other Household Equipment.—Other items of household equipment covered by the housing census include radio, lighting equipment and refrigeration. Table XVI presents a brief summary of the data with respect to these items, giving the numbers and percentages of homes having a radio, electric lights and mechanical refrigeration.

Table XV.—*Occupied Dwelling Units by Heating Equipment, for the United States, Urban and Rural, 1940*

Heating equipment and type of fuel	Total		Per cent, urban and rural		
	Number	Per cent	Urban	Rural-nonfarm	Rural-farm
All occupied units	34,854,532	—	—	—	—
Reporting heating equipment	34,149,065	100.0	100.0	100.0	100.0
With central heating	14,346,835	42.0	58.2	27.0	10.1
Steam or hot-water system	7,427,754	21.8	32.8	9.6	2.0

Table XVI.—*Dwelling Units Having Radio, Electric Light or Mechanical Refrigerator, for the United States, Urban and Rural, 1940*

Item	Total	Urban	Rural-nonfarm	Rural-farm
Radio (occupied units only)				
Reporting	33,890,506	20,010,014	6,969,455	6,911,037
With radio	28,048,219	18,386,121	5,502,730	4,159,368
Per cent of those reporting	82.8	91.9	79.0	60.2
Not reporting	964,026	586,486	182,018	195,522
Electric light (all dwelling units)				
Reporting	36,746,761	21,283,388	7,950,577	7,512,796
With electric light	28,915,486	20,379,352	6,185,089	2,351,045
Per cent of those reporting	78.7	95.8	77.8	31.3
Not reporting	578,709	332,964	116,260	129,485
Mechanical refrigerator (occupied units only)				
Reporting	34,205,414	20,253,009	7,016,193	6,936,212
With mechanical refrigerator	15,093,346	11,339,901	2,718,532	1,034,913
Per cent of those reporting	44.1	56.0	38.7	14.9
Not reporting	649,118	343,491	135,280	170,347

The urban-rural differentials with respect to these forms of equipment are somewhat less, especially with respect to the radio, than in the case of running water and the various types of plumbing equipment. More than 28,000,000, or 82.8%, of the 33,890,506 dwelling units answering the radio question reported the possession of a radio. For the urban units alone the percentage with radio was 91.9, for the rural-nonfarm, 79.0 and for the rural-farm, 60.2.

Of all dwelling units reporting, 78.7% were provided with electric lights. The total was made up of 95.8% of the urban units, 77.8% of the rural-nonfarm and 31.3% of the rural-farm.

The possession of a mechanical refrigerator was reported by 56.0% of the urban units, 38.7% of the rural-nonfarm and 14.9%

of the rural-farm, the percentage for all units combined being 44.1.

The variation from state to state in the extent to which the different forms of household equipment are found in the homes is far greater than the variation between urban and rural-farm areas in the United States as a whole, to which attention has been called in the preceding paragraphs. As an illustration of this diversity there are presented in Table XVII figures indicating for the urban and rural areas in each state the percentage of dwelling units having a radio and the percentage having electric lights.

Sixteenth Census Reports.—The major part of the material from the sixteenth decennial census is published in eight series of state bulletins, each with United States summary; these series are being assembled into bound volumes bearing numbers corresponding to the numbers of the bulletin series. There are four series of population bulletins: First Series, number of inhabitants, for counties, minor civil divisions, incorporated places and metropolitan districts; Second Series, characteristics of the population (including some data on the labour force), for counties, urban places of 1,000 inhabitants or more, minor civil divisions and metropolitan districts; Third Series, statistics on the labour force, including data on occupation, industry, employment and income, for the state and for cities of 100,000 inhabitants or more; Fourth Series, population characteristics by age in correlation with marital status, relationship, education and citizenship, for the state and for cities of 50,000 inhabitants or more.

There are also four series of housing bulletins: First Series, data for small areas, including minor civil divisions, as well as for counties, cities and metropolitan districts; Second Series, general characteristics of housing, for counties, incorporated places of 2,500 inhabitants or more and metropolitan districts; Third Series, characteristics of housing by monthly rent or value of home, for the state and for urban, rural-farm and rural-nonfarm areas; Fourth Series, mortgages on owner-occupied nonfarm homes for urban places and rural-nonfarm areas by counties, for cities of 100,000 inhabitants or more by wards and for metropolitan districts.

Maps of the metropolitan districts are presented in the Second Series population bulletins and also in Volume I of the bound reports on population (but not in the First Series bulletins).

Supplements to the First Series housing bulletins giving data by blocks have been issued for all cities having a population of 50,000 or more in 1930. A series of 58 reports covering 60 cities has also been issued presenting population and housing data by census tracts, which are permanent areas having a population of around 5,000 or 6,000 which have been established for statistical purposes in the larger cities.

Special studies or monographs are in preparation (Jan. 1943) on institutions, internal migration, families, fertility, parentage, mother tongue, veterans and household characteristics.

OCCUPATIONS OF WORKERS IN THE UNITED STATES

The occupations of the 45,166,083 men and women 14 years old and over in the United States who were employed in private or non-emergency government work during the week of March 24–30, 1940, are shown in Table XVIII which follows. These statistics for employed workers cover 85.6% of the entire labour force. Omitted are the 2,529,606 persons who were engaged in public emergency work (such as that provided by WPA, NYA and CCC) and the 5,093,810 persons who were without employment of any kind and were seeking work, for whom the available occupational data would have less significance than for those in regular employment—or at least a different significance.

The statistics are in terms of the 451 occupation titles of the complete 1940 census classification, which was adopted for use in the 1940 census as part of a co-operative effort on the part of governmental and other agencies to standardize occupational classification methods and thereby to increase comparability among occupation statistics from various sources. Because this 1940 classification differs extensively from that used in 1930 and earlier censuses, and because the occupation figures shown here do not cover all persons in the labour force, these 1940 statistics cannot be compared directly with occupation data in the census publications for 1930 and earlier years.

The total employment in each occupation is broken down into male and female—a division which became especially important after the United States entered World War II, because large numbers of men were drawn into the armed services. These figures indicate the occupations in which males normally predominated and which were thus most likely to be affected by the mass transfer of men from civilian to military pursuits. They focus attention upon these male occupations essential to the war production program and in which the need for replacement with women would be greatest. They also indicate the occupations in which sizable numbers of women were ordinarily employed and which thus lend themselves most readily to the substitution of women for men.

Table XVIII.—*Occupation of Employed Persons (Except on Public Emergency Work), by Sex, for the United States, 1940*

("N.e.c." means not elsewhere classified)

Occupation	Total	Male	Female
All occupations	45,166,083	34,027,905	11,138,178
Professional and semiprofessional workers	3,345,048	1,875,387	1,469,661

Millwrights	39,655	39,566	89
Toolmakers, and diemakers and setters	92,745	92,371	374
Masons, tile setters, and stonecutters	102,436	102,089	347
Brickmasons, stonemasons, and tile setters	93,330	93,024	306
Stonecutters and stone carvers	9,106	9,065	41
Mechanics and repairmen, and loom fixers	863,731	859,491	4,240
Mechanics and repairmen, airplane	26,724	26,607	117
Mechanics and repairmen, automobile	376,985	375,796	1,189
Mechanics and repairmen, railroad and car shop	40,218	40,218	..
Mechanics and repairmen (n.e.c.)	397,391	394,552	2,839
Loom fixers	22,413	22,318	95
Molders, metal	75,904	75,559	345
Painters (construct.), paperhangers, and glaziers	354,221	350,372	3,849
Painters, construction and maintenance	322,159	319,948	2,211
Paperhangers	25,414	23,877	1,537
Glaziers	6,648	6,547	101
Plasterers and cement finishers	52,140	51,926	214
Plasterers	38,958	38,792	166
Cement and concrete finishers	13,182	13,134	48
Plumbers, and gas and steamfitters	173,915	173,385	530
Printing craftsmen, exc. compositors and typesetters	61,849	60,830	1,019
Electrotypers and stereotypers	7,971	7,893	78
Photoengravers and lithographers	20,981	20,548	433
Pressmen and plate printers, printing	32,897	32,389	508
Rollers and roll hands, metal	26,547	26,439	108
Roofers and sheet metalworkers	104,135	103,715	420
Roofers and slaters	24,520	24,432	88
Tinsmiths, coppersmiths, and sheet metal workers	79,615	79,283	332
Shoemakers and repairers (not in factory)	60,195	59,609	586
Stationary engineers, cranemen, and hoistmen	286,126	285,352	774
Stationary engineers	184,256	183,739	517
Cranemen, hoistmen, and construction machinery operators	101,870	101,613	257
Structural and ornamental metalworkers	27,951	27,769	182
Tailors and furriers	121,492	105,022	16,470
Tailors and tailoresses	107,577	92,880	14,697
Furriers	13,915	12,142	1,773
Other craftsmen and kindred workers	204,521	192,766	11,755
Decorators and window dressers	27,258	21,106	6,152
Engravers, except photoengravers	7,871	7,242	629
Heat treaters, annealers, and temperers	10,197	10,122	75
Inspectors, scalers, and graders, log and lumber	14,478	14,116	362
Jewelers, watchmakers, goldsmiths, and silversmiths	33,252	31,957	1,295
Millers, grain, flour, feed, etc.	14,748	14,667	81
Opticians and lens grinders and polishers	11,698	10,707	991
Piano and organ tuners	4,839	4,794	45
Sawyers	42,135	41,864	271
Upholsterers	38,045	36,191	1,854
Operatives and kindred workers[2]	8,252,277	6,205,898	2,046,379
Apprentices	84,080	81.807	2,273
Carpenters' apprentices	5,528	5,485	43
Electricians' apprentices	3,070	3,046	24
Machinists' apprentices	13,578	13,505	73
Plumbers' apprentices	4,631	4,518	113
Building and hand trade apprentices (n.e.c.)	12,841	12,764	77
Apprentices, printing trades	9,360	9,140	220
Apprentices, specified trades (n.e.c.)	24,174	22,745	1,429
Apprentices, trades not specified	10,898	10,604	294
Attendants, filling station, parking lot, garage, and airport	213,315	209,449	3,866
Brakemen and switchmen, railroad	107,432	107,432	..
Brakemen, railroad	62,652	62,652	..
Switchmen, railroad	44,780	44,780	..
Chauffeurs, truck drivers, and deliverymen	1,508,421	1,499,972	8,449
Chauffeurs and drivers, bus, taxi, truck, and tractor[3]	1,121,108	1,115,157	5,951
Deliverymen[3]	387,313	384,815	2,498
Conductors, bus and street railway	16,905	16,751	154
Dressmakers and seamstresses (not in factory)	135,951	2,324	133,627
Firemen, except locomotive and fire department	112,995	112,612	383
Laundry operatives and laundresses, exc. private family	216,263	48,296	167,967
Linemen and servicemen, telegraph, telephone and power	104,496	103,501	995
Mine operatives and labourers[4]	651,013	649,226	1,787
Motormen, railway, mine, factory, etc.	53,508	53,281	227
Motormen, street, subway, and elevated railway	36,760	36,572	188
Motormen (vehicle), mine, factory, logging camp, etc.	16,748	16,709	39
Painters, except construction and maintenance	89,026	82,768	6,258
Power station operators	21,905	21,285	620
Sailors and deck hands, except U. S. Navy	35,358	35,221	137

---

[1] Most inspectors in manufacturing industries are classified as operatives.

[2] Mine labourers are included in "Mine operatives and labourers," in this group.

[3] Drivers for bakeries, laundries, dry cleaners, stores, etc., are included in "Deliverymen."

[4] Mine labourers are included in "Mine operatives and labourers," in this group.

Occupation	Total	Male	Female
Operatives and kindred workers—Con.			
Welders and flame-cutters	124,741	122,688	2,053
Other specified operatives and kindred workers	424,551	390,056	34,495
Asbestos and insulation workers	5,539	5,464	75
Blasters and powdermen	4,498	4,485	13
Boatmen, canalmen, and lock keepers	6,735	6,664	71
Buffers and polishers, metal	39,635	37,609	2,026
Filers, metal	9,472	9,027	445
Grinders, metal	42,462	41,846	616
Chainmen, rodmen, and axmen, surveying	7,572	7,553	19
Dyers	21,978	21,334	644
Fruit and vegetable graders and packers, exc. cannery	22,125	9,333	12,792
Furnacemen, smeltermen, and pourers	30,472	30,225	247
Heaters, metal	9,221	9,085	136
Meat cutters, exc. slaughter and packing house	141,072	140,088	984
Milliners (not in factory)	11,155	650	10,505
Motion picture projectionists	22,355	22,099	256
Oilers, machinery	35,838	35,643	195
Photographic process workers	14,422	8,951	5,471
Operatives and kindred workers (n.e.c.), by industry:			
Manufacturing	3,899,633	2,303,054	1,596,579
Food and kindred products	313,068	200,298	112,770
Bakery products	39,887	19,473	20,414
Beverage industries	40,585	34,580	6,005
Canning and preserving fruits, vegetables, and sea food	35,712	12,953	22,759
Confectionery	41,594	13,904	27,690
Dairy products	33,952	28,613	5,339
Grain-mill products	15,195	12,903	2,292
Meat products	81,496	62,972	18,524
Miscellaneous food industries	24,647	14,900	9,747
Tobacco manufactures	71,883	20,225	51,658
Cotton manufactures	355,850	188,695	167,155
Silk and rayon manufactures	75,983	33,925	42,058
Woolen and worsted manufactures	103,764	52,226	51,538
Knit goods	171,993	56,887	115,106
Other textile-mill products	114,799	68,011	46,788
Dyeing and finishing textiles	23,691	18,206	5,485
Carpets, rugs, and other floor coverings	26,775	15,175	11,600
Hats, except cloth and millinery	14,870	10,446	4,424
Miscellaneous textile goods	18,794	9,461	9,333
Not specified textile mills	30,669	14,723	15,946
Apparel and other fabricated textile products	578,663	130,832	447,831
Apparel and accessories	549,206	123,672	425,534
Miscellaneous fabricated textile products	29,457	7,160	22,297
Lumber, furniture, and lumber products	174,498	150,344	24,154
Sawmills and planing mills	56,229	54,922	1,307
Furniture and store fixtures	68,982	59,051	9,931
Miscellaneous wooden goods	49,287	36,371	12,916
Paper, paper products, and printing	212,998	136,637	76,361
Pulp, paper, and paperboard mills	86,280	70,117	16,163
Paperboard containers and boxes	36,240	17,655	18,585
Miscellaneous paper and pulp products	23,095	9,983	13,112
Printing, publishing, and allied industries	67,383	38,882	28,501
Chemicals, and petroleum and coal products	149,449	117,068	32,381
Paints, varnishes, and colors	11,438	9,840	1,598
Rayon and allied products	29,203	19,356	9,847
Miscellaneous chemical industries	76,642	56,288	20,354
Petroleum refining	28,037	27,571	466
Miscellaneous petroleum and coal products	4,129	4,013	116
Rubber products	78,229	55,758	22,471
Footwear industries, except rubber	197,975	106,724	91,251
Leather and leather products, except footwear	70,712	45,947	24,765
Leather: tanned, curried, and finished	27,976	24,360	3,616
Leather products, except footwear	42,736	21,587	21,149
Stone, clay, and glass products	113,518	88,165	25,353
Cement, and concrete, gypsum, and plaster products	12,767	12,522	245
Cut-stone and stone products	4,294	4,227	67
Glass and glass products	51,013	38,854	12,159
Pottery and related products	23,977	14,899	9,078
Structural clay products	11,049	9,560	1,489
Miscellaneous nonmetallic mineral products	10,418	8,103	2,315
Iron and steel, and not spec. metal industries	306,404	263,837	42,567
Blast furnaces, steel works, and rolling mills	104,719	99,934	4,785
Tin cans and other tinware	12,273	6,321	5,952
Miscellaneous iron and steel industries	179,638	149,524	30,114
Not specified metal industries	9,774	8,058	1,716
Nonferrous metals and their products	73,550	52,849	20,701
Nonferrous metal primary products	17,951	15,698	2,253
Clocks, watches, jewelry, and silverware[5]	29,666	17,403	12,263
Miscellaneous nonferrous metal products	25,933	19,748	6,185
Machinery	282,701	198,523	84,178
Agricultural machinery and tractors	19,091	18,310	781
Electrical machinery and equipment	137,832	74,232	63,600
Office and store machines, equipment and supplies	21,201	14,940	6,261
Miscellaneous machinery	104,577	91,041	13,536
Automobiles and automobile equipment	199,169	173,283	25,886
Transportation equipment, except automobile	60,596	58,682	1,914
Aircraft and parts	25,570	24,478	1,092
Ship and boat building and repairing	25,387	25,111	276
Railroad and miscellaneous transportation equipment	9,639	9,093	546
Other manufacturing industries	193.831	104,138	89,693
Scientific and photographic equipment and supplies	27,367	16,615	10,752
Miscellaneous manufacturing industries	110,001	57,013	52,988
Not specified manufacturing industries	56,463	30,510	25,953
Nonmanufacturing	452,684	366,175	86,509
Agriculture, forestry, and fishery	14,585	12,381	2,204
Construction	39,294	39,012	282

---

[5] Includes metal engraving (except for printing purposes), plating, and polishing.

Table XVIII.—*Occupation of Employed Persons (Except on Public Emergency Work), by Sex, for the United States, 1940—Continued*

Occupation	Total	Male	Female
Operatives and kindred workers—Con.			
Operatives and kindred workers (n.e.c.), by industries—Con.			
Nonmanufacturing—Con.			
Railroads (incl. railroad repair shops)	61,629	61,216	413
Street railways and bus lines	8,935	8,838	97
Trucking service	1,706	1,663	43
Warehousing and storage	5,082	4,004	1,078
Miscellaneous transportation	7,568	7,332	236
Communication	2,000	1,796	204
Utilities	22,457	22,016	441
Wholesale and retail trade	135,074	91,304	43,770
Automobile storage, rental, and repair services	16,319	16,164	155
Business and miscellaneous repair services	17,039	14,783	2,256
Laundering, cleaning, and dyeing services	68,307	44,185	24,122
Hotels and miscellaneous personal services	6,763	5,137	1,626
Finance, insurance, and real estate	4,186	3,920	266
Amusement, recreation, and related services	6,081	5,594	487
Professional and related services	7,677	5,730	1,947
Government	12,165	9,685	2,480
Industry not reported	15,817	11,415	4,402
Domestic service workers	2,111,314	142,231	1,969,083
Housekeepers, private family	365,320	2,889	362,431
Laundresses, private family	189,592	3,409	186,183
Servants, private family	1,556,402	135,933	1,420,469
Protective service workers	681,534	677,213	4,321
Firemen, fire department	77,782	77,782	..
Guards and watchmen	212,259	210,004	2,255
Guards, watchmen, and doorkeepers	195,957	193,833	2,124
Watchmen (crossing) and bridge tenders	16,302	16,171	131
Policemen, sheriffs, and marshals	171,568	169,502	2,066
Policemen and detectives, government	127,858	126,977	881
Policemen and detectives, except government	19,279	18,587	692
Marshals and constables	8,727	8,617	110
Sheriffs and bailiffs	15,704	15,321	383
Soldiers, sailors, marines, and coast guards[6]	219,925	219,925	..
Service workers, exc. domestic and protective	2,776,800	1,519,482	1,257,318
Barbers, beauticians, and manicurists	416,031	209,439	206,592
Boarding house and lodginghouse keepers	110,849	10,494	100,355
Charwomen, janitors, and porters	575,624	499,519	76,105
Charwomen and cleaners	67,710	30,857	36,853
Janitors and sextons	352,424	315,103	37,321
Porters	155,490	153,559	1,931
Cooks, except private family	276,646	160,336	116,310
Elevator operators	76,806	64,120	12,686
Housekeepers, stewards, hostesses, exc. private family	79,175	16,824	62,351
Practical nurses and midwives	91,107	3,909	87,198
Servants, except private family	316,153	141,429	174,724
Waiters and bartenders	640,490	281,354	359,136
Bartenders	113,702	110,602	3,100
Waiters and waitresses, exc. private family	526,788	170,752	356,036
Other service workers, exc. domestic and protective	193,919	132,058	61,861
Attendants, hospital and other institution	95,549	54,307	41,242
Attendants, professional and personal service (n.e.c.)	24,465	10,627	13,838
Attendants, recreation and amusement	41,516	39,052	2,464
Bootblacks	14,237	13,945	292
Ushers, amusement place or assembly	18,152	14,127	4,025
Farm laborers and foremen	3,090,010	2,770,005	320,005
Farm laborers (wage workers) and farm foremen	1,921,890	1,828,164	96,726
Farm foremen	24,475	24,240	235
Farm laborers (wage workers)	1,900,415	1,803,924	96,491
Farm laborers (unpaid family workers)	1,165,120	941,841	223,279
Laborers, except farm and mine	3,064,128	2,965,693	98,435
Fishermen and oystermen	55,274	54,876	398
Longshoremen and stevedores	63,543	63,241	302
Lumbermen, raftsmen, and woodchoppers	127,884	127,497	387
Other specified laborers	224,134	222,194	1,940
Garage laborers and car washers and greasers	51,864	51,456	408
Gardeners, except farm, and groundskeepers	147,167	145,755	1,412
Teamsters	25,103	24,983	120
Laborers (n.e.c.), by industry:			
Construction	437,834	435,808	2,026
Manufacturing	1,309,900	1,237,239	72,661
Food and kindred products	147,592	133,945	13,647
Bakery products	6,642	5,767	875
Beverage industries	19,006	18,164	842
Canning and preserving fruits, vegetables and sea food	21,938	17,743	4,195
Confectionery	5,868	4,117	1,751
Dairy products	14,247	13,505	742
Grain-mill products	18,306	17,912	394
Meat products	39,503	35,599	3,904
Miscellaneous food industries	22,082	21,138	944
Textiles, textile products, and apparel	86,994	72,943	14,051
Cotton manufactures	35,087	30,824	4,263
Silk and rayon manufactures	5,916	4,959	957
Woolen and worsted manufactures	10,927	9,883	1,044
Knit goods	4,927	3,337	1,590
Dyeing and finishing textiles	5,144	4,931	213
Carpets, rugs, and other floor coverings	6,121	5,474	647
Hats, except cloth and millinery	501	450	51
Miscellaneous textile goods	4,653	4,116	537
Not specified textile mills	2,951	2,610	341
Apparel and accessories	8,207	4,413	3,794
Miscellaneous fabricated textile products	2,560	1,946	614
Lumber, furniture, and lumber products	257,399	252,922	4,477
Sawmills and planing mills	198,493	197,103	1,390
Furniture and store fixtures	26,901	26,063	838
Miscellaneous wooden goods	32,005	29,756	2,249
Paper, paper products, and printing	59,923	55,037	4,886
Laborers, except farm and mine—Con.			
Laborers (n.e.c.), by industry—Con.			
Manufacturing—Con.			
Paper, paper products, and printing—Con.			
Pulp, paper, and paperboard mills	39,813	38,163	1,650
Paperboard containers and boxes	8,418	6,903	1,515
Miscellaneous paper and pulp products	3,647	2,865	782
Printing, publishing, and allied industries	8,045	7,106	939
Chemicals, and petroleum and coal products	108,128	105,122	3,006
Paints, varnishes, and colors	5,186	5,018	168
Rayon and allied products	5,089	4,702	387
Miscellaneous chemical industries	66,420	64,123	2,297
Petroleum refining	25,082	24,963	119
Miscellaneous petroleum and coal products	6,351	6,316	35
Leather and leather products	24,142	20,200	3,942
Leather: tanned, curried, and finished	11,333	10,981	352
Footwear industries, except rubber	9,919	7,010	2,909
Leather products, except footwear	2,890	2,209	681
Stone, clay, and glass products	91,077	88,131	2,946
Cement, and concrete, gypsum, and plaster products	22,781	22,661	120
Cut-stone and stone products	2,965	2,944	21
Glass and glass products	16,445	15,191	1,254
Pottery and related products	6,547	5,823	724
Structural clay products	34,298	33,811	487

Central America. The portion of the Americas lying between Mexico and Colombia, includin the republics of Guatemala, El Salvador, Costa Rica, Honduras Nicaragua and Panama, and also the colony of British Hondura and the Panama Canal Zone. The total area amounts to approximately 222,675 sq.mi.; the population approximates 8,500,00 with by far the greater number of the inhabitants living in th western cordillera at elevations 2,000 to 6,000 feet.

History.—All of the Central American states co-operated willingly in hemisphere defense during 1942. In each the usua methods of counteracting subversive activities were put int

TRANSISTHMIAN HIGHWAY across Panama was completed in 1942 under ne supervision of the U.S. Public Roads administration

ffect, with dangerous persons arrested and some deported; alien nemy property was sequestered, armed forces increased, and roduction of strategic materials encouraged. In all states it was ecessary to establish government control over motor vehicles, ires and fuels; also it was found necessary to set price ceilings n at least some commodities.

Transportation by sea suffered interference because of subma- ine activity and because many fruit company boats were diverted o other uses. A shortage of tankers also was serious; Central merican local industry and transportation is dependent on im- orted fuels. The sharp decrease in the nonessential banana in- ustry resulted in a serious loss of revenue to Honduras, Costa Rica and Panama. The United Fruit company, in conjunction ith the U.S. Board of Economic Warfare, speeded plans for ne cultivation of some 40,000 ac. of abaca in Costa Rica, Guate- nala and Panama, and for rubber plantings in Honduras and osta Rica.

Education.—The effectiveness and extent of the educational ystems in the several states vary widely; Costa Rica has the best teracy rate.

Trade.—Since the American nations had generally suspended ublication of statistical material which might be of aid to the nemy, it was impossible to give figures for 1942. The volume f imports was greater for 1942 than for exports; an entirely nusual condition for Central America. The total amounts of oods shipped decreased, but because of a rise in prices, total alues declined to a lesser extent. The banana industry suffered ne most, with exports down possibly as much as 85%.

Communication.—External communication is by sea and Pan merican Airways, the latter of which reported great increase in ervice in 1942 while the former was curtailed. Great efforts were nade during 1942 to rush completion of the Inter-American ighway, with the U.S. having pledged a total of $20,000,000 for ne purpose. (*See* articles on separate countries and HISPANIC MERICA AND WORLD WAR II.)

Cereals: *see* BARLEY; CORN; OATS; RICE; RYE; WHEAT.

Ceylon. A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. Area 25,332 sq.mi.; pop. (est. Dec. 31, 1940) 5,981,000. Chief towns (pop. census 1931): Colombo (cap., 284,155); Jaffna (45,708); Galle (34,424); Kandy (37,147). Governor in 1942: Sir Andrew Caldecott, K.C.M.G.; languages, English, Sinhalese, Tamil; religions: Buddhism and Hinduism the chief.

History.—The first Japanese air attack was experienced on Easter Sunday, 1942. At the end of March a war council had been formed consisting of the governor, the commander in chief, the board of ministers and representatives of the navy, army and air force. A permanent Ceylon representative in India was appointed, and Sir Baron Jayatilaka was chosen for the post.

Industrial development was furthered by the launching of ten factories, sponsored by the ministry of labour, industry and commerce. While some of the factories were created for war needs, others were the result of earlier industrial plans, but most of them were devoted to war manufacture; Ceylon's first steel rolling mill was in operation. There was an improvement in the island's finances, the railway having done well and customs revenue having improved.

On July 1, 1942 the University of Ceylon came into being, in succession to the University College of Colombo, inaugurated in 1921.

Education.—In 1940: Sinhalese and Tamil schools 3,175; scholars, 389,153 boys, 172,448 girls: English and bilingual schools 408; scholars, 71,536 boys, 30,702 girls. Total number of schools 5,816; scholars 819,297.

Banking and Finance.—Revenue (1940–41) £8,616,000; (est. 1941–42) £9,384,400; expenditure (1940–41) £8,516,296; (est. 1941–42) £9,474,876; public debt (Sept. 30, 1940) £9,408,775 and Rs. 45,270,000; currency Rs. 1 = 100 cents = 1*s*.6*d*. in 1942.

Trade and Communication.—Overseas trade, merchandise, 1941: imports Rs. 259,510,454; exports (domestic) Rs. 264,717,885; re-exports Rs. 12,307,004. Communications and transport 1940: roads, motorable 5,633 mi.; railways (117 mi. narrow gauge) total 960 mi.; shipping, entered 6,489,322 net tons; motor vehicles licensed (Dec. 31, 1941), 20,092 motor cars and taxis; 4,394 trucks and vans; 2,486 omnibuses; 2,644 cycles; 66 tractors; 231 trailers; wireless receiving set licences (Dec. 31, 1940), 9,736; telephone instruments in use (1938), 10,424.

Agriculture.—Production, in metric tons: rice (1938–39) 300,-

000; copra (including coco-nut oil) (1939) 155,000; tea (1940) exports 112,000; rubber (1940) shipments 90,000.

Chain Stores: *see* Business Review.

Chambers of Commerce. Chambers of commerce generally adopted the attitude that "war is our business," and it was upon this thesis that practically all of their activities in the United States for 1942 were based. The Chamber of Commerce of the United States, which is a federation of approximately 1,800 chambers of commerce and trade associations, with a membership of approximately 700,000, increased its services and directed them toward the goal of winning the war. While the Chamber of Commerce of the United States gave full support to all necessary war measures, the work of interpreting the economic and social aspects of governmental action continued in order that business institutions of all kinds could adjust themselves quickly to the numerous and complicated requirements of the war program. (E. A. Jn.)

Champion, Pierre (1880–1942), French historian, born in Paris, studied at the Collège Henri IV and at the École des Chartres. An expert archivist and palaeographer, he uncovered original data for his many historical and biographical works. He was named to Marshal Pétain's advisory national council and had served as mayor of Nogent-sur-Marne. Champion collaborated with Anatole France on a biography of Joan of Arc. He was the author of *Les plus anciens monuments de la typographie parisienne 1470–72* (1904), *Vie de Charles d'Orléans* (1911), *François Villon, sa vie et son temps* (1914), *Procès de condamnation de Jeanne d'Arc* (1920–21), *Histoire poétique du XVe siècle* (1924), *La galerie des rois* (1934), *L'envers de tapisserie, Jeanne d'Arc* (1935) and *Paganisme et réforme* (1936). He died in Paris, June 29.

Chang Ching-hui (1871–1942?), Chinese politician, was born in Taian, Fengtien, China. A graduate of the Fengtien military academy, he became a major general in 1916 and was prominent in Manchurian politics prior to the Japanese invasion of 1931. He was governor of the special Harbin district when Japanese armies marched into Manchuria and joined up with the Nipponese invaders, ostensibly for the "preservation of peace" in Harbin. But Japanese protection helped further his political ambitions, and by 1935 he became prime-minister of the puppet Manchoukuo state, ranking second only to Pu Yi, the Japanese-sponsored emperor. A Chungking communiqué of Dec. 22 said that Chang committed suicide after he had poisoned his family and had shot his Japanese adviser and five other officials. The Chungking dispatch said Chang had had a change of heart.

Channel Islands: *see* British Empire.

Cheese. Production of cheese declined sharply in the latter part of 1942 and in December was 23% below the production of Dec. 1941. The year's output in 1942, however, exceeded that of 1941. Total cheese production for the first 11 months of 1942 was 1,060,958,000 lb., an increase of 21% over the same period in 1941. The midwinter decline in cheese production was attributed to several factors. Many factories shifted to butter manufacture—a departure from the strong emphasis placed on increasing cheese production when lend-lease shipments were first started and only inconsequential attention was given to butter. Cheese makers also found themselves at a disadvantage in obtaining milk supplies in competition with manufacturers of dried skim milk. To offset these conditions, the governmen late in 1942 established a subsidy of $3\frac{3}{4}$ cents per lb. for American cheese. The OPA permanent price ceiling on American chees was announced as 27 cents per lb. It was believed that th subsidy would cause manufacturers of other varieties to chang over, particularly the makers of brick cheese, but up to th middle of Jan. 1943 no such shift was apparent. Purchases of cheese by the Food Distributing administration from March 15 1941 (the start of the lend-lease program), to Jan. 2, 1943, wer 408,640,513 lb. of American cheese and 26,616,500 lb. of processe cheese. (*See* also Butter; Dairying; Milk.) (S. O. R.)

Chemical Therapy: *see* Chemotherapy.

Chemistry. It is understandable that many of the developments in chemistry for 1942 were influenced by the war. Coinage and rubber are two such items which may be discussed.

The New Nickel.—Until recently, the 5-cent U.S. coin was an alloy made up of 75% copper and 25% nickel. The critica shortage of nickel caused the search for substitute metals. Stainless steel was considered, but rejected after the Pearl Harbor episode, because of the greatly reduced imports of chrome for the stainless steel. An alloy of silver and copper seemed to be suitable until tested in vending machines. Many of these machines are constructed to reject counterfeit coins on the basis of the high electrical resistance of the coin nickel, and these machines rejected the new alloy because silver and copper both are excellent conductors of electricity. Sufficient electrical resistance was discovered in an alloy, adopted till Dec. 31, 1946 by congressional action, containing 56% copper, 35% silver, and 9% manganese. This alloy has to be heated to 650° C. to facilitate rolling, whereas ingots of the old copper-nickel alloy had the advantage that they could be pressed into flat strips by "cold rolling."

Synthetic Rubber.—Curtailment of the supply of natural rubber brought the synthetic rubber problem to a vitally importan position in 1942. No fundamental changes were introduced, so suffice it to say that the gas known as butadiene is the essentia starting material in most of the plans.

Several sources of butadiene were being developed, the two chief ones being petroleum and alcohol. Once made, the butadiene from one source is indistinguishable, of course, from butadiene from any other source. Pyrolysis of naphtha and light oils gives rise to butadiene along with other hydrocarbons. By selection of the hydrocarbon stock as butane or butene and by use of appropriate dehydrogenation catalysts the yield of butadiene may be increased materially. In both operations a necessary step is the separation of the butadiene from the other gases with which it is mixed. Liquefaction and distillation will remove all but the butane and butene. Various solvents were found in which butadiene is appreciably more soluble than butane or butene, one of which is furfural. The solution of butadiene is then heated to expel the butadiene. The government program called for 107,800 tons of butadiene a year by the pyrolytic method, and 340,000 tons by the catalytic dehydrogenation method as soon as necessary plants can be built.

Another 220,000 tons was visualized from alcohol as the raw material. Alcohol vapour is passed over a suitable catalytic surface and butadiene is formed, together with both hydrogen and water. A mixture of alumina and zinc oxide was proposed as a suitable catalyst for this reaction. The alcohol itself may be obtained either from petroleum or from grain.

Another method which might enter the rubber program at a later date starts with a fermentation of grain in the presence of *Aerobacter aerogenes.* 2,3-Butanediol, otherwise known as β utylene glycol, is produced in satisfactory quantities. Conver- on of this to its diacetate and pyrolysis of the latter at 500° C. roduces high yields of butadiene.

The steps employed in converting butadiene into synthetic rub- er briefly are these: (1) Mix butadiene with styrene and emul- fy the mixture in water in the presence of soap-like substances. 2) Add a polymerizing agent such as benzoyl peroxide to the mulsion, and heat while stirring for 10–15 hours at 60° C. (3) oagulate this synthetic rubber latex by addition of acetic acid r salt solutions. (4) Collect the coagulum and work up the roduct on a rubber mill.

"Butyl rubber" is also important. Instead of using butadiene calls for isoprene, but only a small quantity is required. Iso- utylene is the major ingredient, and this is produced in large uantities in petroleum refineries. The isoprene may be obtained y pyrolysis of turpentine. In the Baruch report, about 132,000 ong tons of butyl rubber per year were envisioned, compared to 05,000 tons of Buna-S and 40,000 tons of neoprene.

Many materials unlike rubber chemically, but with rubber-like roperties also were being developed at a rapid pace. One of hese was thiokol, which is merely a reaction product of sodium olysulphide and ethylene chloride. This is the most oil resistant of the rubbers, and also is suitable for emergency use as retreads on tires. Koroseal is another rubber-like substance with widespread uses. It is made by polymerizing vinyl chloride and incorporating a suitable plasticizer such as tricresyl phosphate.

Plastics.—For many years the public had been conscious of the growing use of plastics, but the public generally was unaware either of the immensity of this development, or of the steady discovery of new plastic materials. A preliminary total of the U.S. Tariff commission for 1941 showed the annual production of 437,800,000 lb. of synthetic resins for plastics, and an estimated 55,000,000 lb. of plastics from cellulose. This industry is intimately linked also with that of synthetic fibres for textiles and synthetic rubber. Nylon, for example, is a plastic, although its major use till 1942 was in textiles. Furthermore, 451,204,000 lb. of rayon yarn were produced in 1941, of which 163,745,000 lb. were of the cellulose acetate variety, almost identical in composition with the cellulose acetate used for plastics.

Alkyd resins start with phthalic anhydride and glycols. Phenolic resins, urea plastics, melamine resins, and plastics from zein or casein require aldehydes, principally formaldehyde, in their compounding. Polyvinyl butyral, the plastic making use of butyraldehyde and polyvinyl alcohol in its synthesis, was in 1942 going into waterproof raincoats, although its original use was as the laminated sheet in safety glass. The transparency of polymerized

OAL PILE at a U.S. chemical plant, used not for fuel but for the manufacture f hundreds of different chemical products, most of which were directed to war ses in 1942

methyl methacrylate (lucite or plexiglas) is the basis for many uses. A hardened transparent resin of the latter type is formed by adding a few parts of acrylic or methylacrylic anhydride to the methyl methacrylate during its polymerization. This "hardened" lucite is more suitable for aeroplane windows, than ordinary lucite. A new and beautifully transparent plastic announced by the Columbia chemical division of the Pittsburgh Plate Glass company, known as C.R. 39, resists abrasion still better. Polystyrene is another plastic which, while lacking this type of hardness, is exceptionally clear. Styrene changes to polystyrene on standing, but the process is accelerated by peroxides. Styrene itself is made from ethylbenzene by pyrolysis, and the ethylbenzene is made by addition of benzene to ethylene in the presence of aluminum chloride. Finally, mention may be made of saran, a plastic made by polymerization of vinylidene chloride, $CH_2=CCl_2$. The plastic is tough, and pipes of it may be welded readily by heating the ends to 175° C.

General Organic Reactions.—Ketene, $CH_2=C=O$, is made by pyrolysis of acetone at 700° C. and may be dissolved in acetone without reaction. Gwynn and Degering discovered that the presence of a trace of sulphuric acid is all that is necessary to initiate addition of ketene to acetone to form methylvinyl acetate in 45% yield.

F. Fichter and Rudin electrolyzed a mixture of diethylacetic acid and its potassium salt. The expected compound was 3,4-diethylhexane, but only 5% of it was formed. The chief products were 3-pentanol, 2-pentanol, and esters of these two alcohols with the starting acid.

R. L. Burwell, Jr. made an interesting study on the racemization of secondary butyl alcohol, $CH_3-CH(OH)-C_2H_5$. Possessing as it does four different groups (H, OH, CH_3, C_2H_5) around a common carbon atom, the alcohol is actually a mixture of two substances depending on the clockwise or counter-clockwise arrangement of any three of these four groups. As usually prepared, equal amounts of both varieties are present, and the mixture has no effect on polarized light. If separated into the two parts (by conversion to *sec*-butyl brucine phthalate, crystallization, and subsequent hydrolysis) one of these two parts rotates the plane of polarized light to the right, and the other to the left. The former is known as the *dextro* isomer, and the latter as the *levo* isomer.

Burwell found that these pure dextro and levo isomers were "racemized" (*i.e.,* converted back to the mixture) by the action of either sulphuric acid or hydrogen fluoride, but not by phosphoric acid. The kinetics of this racemization showed it to be a first order reaction. Sulphuric acid also changes *sec*-butyl alcohol to butylene gas and butylene polymers, but more drastic conditions are required for these changes than for racemization.

Semerano and Riccoboni obtained evidence for the production of the free ethyl radical at low temperature. Their procedure was to allow an alcoholic solution of silver nitrate to act at −80° C. with tetraethyllead, the familiar anti-knock ingredient in "ethyl" gasoline. Ethylsilver, C_2H_5Ag, is formed first, but it is very unstable and breaks down at −35° into silver and ethyl. Two-fifths of the ethyl radical polymerized spontaneously to *n*-butane, whereas three-fifths of it underwent disproportionation to ethane and ethylene. Less ethylene was formed than demanded by theory, but this was explained by its interaction with alcohol, the solvent, forming some ethyl ether.

An interesting approach to the mechanism of oxidation of sodium propionate by potassium permanganate was performed by Nahinsky, Rice, Ruben and Kamen of the University of California. It had been known for a long time that this 3-carbon compound changed to sodium oxalate (two carbons) but it was impossible to tell which two carbons were preserved. They prepared the propionic salt by reaction of ethylmagnesium bromide and carbon dioxide containing radioactive carbon. The latter, of atomic weight 11, was made by bombardment of boric acid with deuterons. This propionate possessed a radioactive carbon on the carboxyl group. Since the sodium oxalate which was created also was radioactive, this proved that the break in the propionic skeleton was between atoms 2,3 and not 1,2.

Wallingford's development at the Mallinckrodt Chemical Works of ethyl carbonate as a reagent in the Claisen condensation of esters produced some striking results. In this condensation, an acetic ester changes to a malonic ester and ethyl alcohol: $RCH_2COOC_2H_5+(C_2H_5O)_2CO \rightarrow RCH(COOC_2H_5)_2+C_2H_5OH$. Malonates are useful in the synthesis of barbiturates (drugs) or higher monobasic acids, but attempts to carry out this process which, incidentally, dates back to the work of Wislicenus in 1887, had always given very poor yields. Wallingford and collaborators found that the cause of the poor yields, namely, the reversibility of this process, could be overcome in large measure by applying the principles of mass action. They used an excess of the ethyl carbonate and removed the ethyl alcohol as fast as it was formed. Sodium ethoxide was the catalyst.

The same principles were applied to the reaction of ethyl carbonate and ketones, giving rise to improved yields of beta keto esters. Alkylation of malonic esters was accomplished also by use of alkyl carbonates instead of alkyl halides, and particularly useful was the discovery that alkyl carbonates may serve as solvents in which to carry out such reactions.

Selwood's work at Northwestern university on free radicals showed that the previously accepted method of molecular weight determination was a misleading guide to the extent of radical formation. He approached the problem differently, by magnetic measurements on the compounds suspected to be free radicals. With this method, the so-called triphenyllead, triphenylgermanium, trimethyltin and tritolyltin were all shown to be diamagnetic when measured in the delicate Gouy balance. This means that the compounds all exist in the dimeric state instead of as free radicals. No denial of the existence of triarylmethyl or diarylnitrogen is shown by these measurements, but even here, the molecular weight approach has given erroneous conclusions.

A triarylmethyl would possess an uneven number of electrons, whereas its dimer hexaarylethane would possess an even number. The former, with its odd number of electrons, is paramagnetic and easily detected by this method. Cis and trans decalin were shown by Selwood and Byerly to have practically identical magnetic susceptibilities, but the authors believed that the slightly greater paramagnetism shown by the cis isomer was of real significance, because in this form the atomic orbits may be slightly more distorted than in the trans form.

Stilboestrol.—Search for synthetic compounds with oestrogenic activity comparable to that of the female sex hormones had been going on for a few years. One of the most promising compounds thus discovered is *trans* 3,4-bis-*p*-hydroxyphenyl-3-hexene, $HOC_6H_4-C(C_2H_5)=C(C_2H_5)-C_6H_4OH$. This substance is related to the hydrocarbon stilbene, and was named stilboestrol. The British investigators, E. C. Dodds and Robert Robinson, discovered that for the production of oestrus it is nearly as potent as oestradiol and more potent than oestrone.

During 1942 E. E. Reid and Edith Wilson prepared a number of ethers (methyl, ethyl, butyl, etc.) of this phenol and found that a lessening of activity results with increasing size of the alkyl group introduced, and that the diethers are less reactive than the monoethers.

Lignin.—Bailey of the University of Washington prepared a so-called "butanol lignin" by extracting chips of western hemlock with equal parts of water and butanol under pressure at 160° C.

keeping this solution at 160° in the presence of some hydro- oric acid, he was able to convert about one-quarter of the lignin volatile compounds. Formic acid, and propyl alcohol predom- ed, but allyl alcohol, methanol, acetone, *n*-butyraldehyde, and ethylcrotonaldehyde were present also in fair amounts. Sim- treatment of aspen and jack pine gave different results, point- to the inhomogeneity of the lignin of different species.

Carbohydrates.—Many interesting developments were noted his field of chemistry, but only a few can be mentioned. One hese was based on Reich's work in 1939 that *p*-phenylazoben- tes of glucose and fructose may be separated by a preferen- type of adsorption on alumina or silica. Since the layers of orbed material are coloured and therefore visible, the process nown as chromatographic adsorption. G. H. Coleman of the versity of Iowa extended this suggestion to a working process the separation of glucose from sucrose, fructose from ga- ose, lactose from sucrose, glucose from melezitose, maltose m glucose, and others. As might be expected, some other car- ydrate pairs did not give satisfactory separation.

At the Massachusetts Institute of Technology, Purves made an enious study of the distribution of the acetyl groups in a tech- al cellulose acetate, which averaged 2.44 out of a possible 3 tyl groups per glucose unit. Esterification of the remaining 6 hydroxyl group by toluenesulphonyl chloride and analysis of groups introduced showed ratios of 23.4:2.16:0.106 for posi- ns 6,2, and 3, respectively. That on position 6 could be deter- ied by direct reaction with sodium iodide and positions 2,3 e estimated by mathematical analysis of the rates of esterifi- ion.

The positions of the ethyl groups in the incompletely-ethylated nical ethylcellulose were shown to be about the same, namely, atio of 15 : 2.3 : 0.7 for positions 6, 2, 3. This means obviously t position 3 is most acetylated or ethylated in the technical rations, and position 6 is the most difficult to attack. Posi- ns 2 and 3 are secondary and position 6 is primary.

Yackel, Unruh and Kenyon of Eastman Kodak company an- nced that cellulose is preferentially attacked at position 6 by rogen dioxide. The oxidation converted the primary alcohol up to a carboxyl group in yields approaching the theoretical.

Haskins, Hann and Hudson of the National Institute of Health cted syntheses of cellobiose and lactose. The lactose synthesis rted with the acetone derivative of mannosan and tetraacetyl- actosyl bromide. This connected a galactose unit to the 4- ition of the mannose unit. Epimerization of the mannose unit he required glucose unit was accomplished by complete acetyla- n (after removal of the acetone and opening of the mannosan g by a mixture of acetic acid, acetic anhydride, sulphuric acid), version to lactal hexaacetate by routine procedures, and oxida- n of the double bond in the latter by perbenzoic acid.

Structure of Biotin.—A few years ago a yeast-growth sub- nce was isolated by Kögl and named biotin. This substance, ch had also been named vitamin H by György, is the factor in st, liver and various foods which is capable of preventing the al symptoms resulting when animals are fed large quantities of egg white. The chemical identity of biotin was established ing 1942, largely through the work of du Vigneaud and col- orators at Cornell University Medical college. Although the of biotin in nutrition was not fully understood in 1942, its ct in preventing death in rats fed on an egg-white diet was azing, for as little as forty billionths of a gram per day (0.04γ, erein $1\gamma = 0.001$ mg.) is sufficient to prevent this kind of ality.

Biotin was extracted from liver extracts and milk concentrates chromatographic adsorption. It was a crystalline compound, lting at 230° C., of the composition $C_{10}H_{16}O_3N_2S$. The structure of biotin was shown to have nine carbon atoms in a continuous chain, the first of these nine being an acid carbon (carboxyl). A sulphur atom joined atoms 6 and 9, whereas a urea residue joined atoms 7 and 8. The urea residue was recognized by alkaline hydrolysis, thereby giving rise to an analogous compound with two amine groups on atoms 7 and 8. Reaction of this diamine with phosgene regenerated biotin. Five of the nine carbons were shown to be $-(CH_2)_4COOH$ because adipic acid, $HOOC(CH_2)_4COOH$, was formed by destructive oxidation of biotin with nitric acid. The urea residue could not have involved atoms 1 to 5, because of this oxidation evidence. This evidence, however, did not eliminate the possibility of attachment at 6,8 or 6,9 (rather than 7,8) but reaction of the diamine with phenanthraquinone did so. Such a reaction requires the two amine groups to be on adjacent carbon atoms, thereby substantiating the 7,8-position. Additional evidence in support of the structure of the diamine was afforded by its degradation to a thiophene derivative, namely, δ-(α-thienyl)-valeric acid, by indirect loss of two equivalents of ammonia. (*See* also VITAMINS.)

Chemistry and Engineering, Agricultural, U. S. Bureau of.

After the outbreak of war, the bureau's activities were directed toward the country's all important objective through work on food preservation, the derivation of rubber, fibres, plastics and other industrial products from farm commodities, development and conservation of machinery for producing, harvesting and processing crops, and the design and upkeep of structures for crop storages and other farm needs.

One promising result was an improved process of fermenting corn, wheat, or other carbohydrate materials to 2, 3-butylene glycol which, like alcohol, can be converted into butadiene, the most important intermediate for synthetic rubber. This not only offered an alternative method of producing rubber indirectly from plentiful farm crops, but yielded a product that had other emergency uses and a number of peacetime applications. Several industrial concerns were making butylene glycol on a pilot-plant scale on the basis of information furnished by the bureau.

A rubber-like vulcanizable material, named Norepol, was produced by polymerizing certain constituents of semi-drying vegetable oils, such as oils pressed from corn germs and soybeans. It was in commercial production for use in jar rings and some other products usually made from rubber. The bureau found that a turpentine derivative, myrcene, might be used with other polymerizable materials in making a rubber substitute.

Chemists and engineers of the bureau were collaborating with other units of the department on problems of extracting latex from various rubber-bearing plants, and the development of harvesting equipment for such plants.

The bureau's successful development of large-capacity machines for cutting lint cotton into short lengths like linters made it possible to use lint cotton in existing nitrating equipment. A special cotton twine having the properties required for use in grain binders was developed to replace sisal and henequen binder twines.

In efforts to obtain substitutes for palm oil and coco-nut oil and supplements for domestic drying oils considerable progress was made in the chemical modification of domestic vegetable oils.

Results obtained indicated that the rancidity of lard and other edible fats and oils could be retarded by adding, in small quantity, a mixture containing compounds of fatty acids with certain alcohols closely related to vitamin C (ascorbic acid).

Artificial fibres were made experimentally from soybean protein. These were somewhat weaker than those made from casein, but it was believed the difference could be made up by modifying the soybean protein. Equal parts of soybean protein and casein yielded fibres having a tensile strength nearly equal to that of fibres made from casein alone.

Other proteins, especially those from soybeans, cotton-seed, peanuts, corn and feathers, were being investigated as possible supplements or substitutes for casein in its important industrial uses.

In connection with research on dehydration of vegetables, a survey was made of the entire food dehydration industry. This provided basic information for expansion to meet war demands. On the basis of experimental work, detailed information was disseminated on the requirements for dehydrating some of the more important vegetables, together with construction plans for dehydrators of different sizes and types. The flavour, keeping quality and nutritive value of dehydrated vegetables have been much improved.

Bureau chemists and bacteriologists co-operated with the egg processing industry in determining the effects of various conditions and extent of drying on the quality of dried mixed eggs, and the types of containers and conditions during transportation and storage required to maintain quality in dried eggs and frozen eggs.

New food products resulting from work of the bureau included additional dehydrated vegetable products, frozen purees of fruits and vegetables, a bland apple syrup for sweetening purposes, self-preserving fruit marmalades, green beans preserved by pickling process, fruit concentrates in liquid and powdered form, a modified pectin which reduces the sugar required for jellies and preserves, and a coffee-and-sugar concentrate.

With the outbreak of the war much of the work on farm buildings was directed toward adapting existing structures to emergency needs. Designs for farm storage facilities for grain and potatoes were improved; building plans which required smaller quantities of critical materials were developed; special machines and planter attachments which conserve fertilizers by improved distribution were designed, built and demonstrated in collaborative tests at state agricultural experiment stations; improvements were made in the equipment and practices for conditioning, ginning and baling of cotton, and in the machines and methods for harvesting and processing fibre flax. Work was started on the development of machinery for use in producing and processing hemp fibre. (*See* also CHEMISTRY; CHEMURGY.) (W. W. SR.)

Chemotherapy. Some of the findings during 1942 were effected from work begun in previous years; others followed investigations occasioned immediately by war needs and drug shortages. Some drugs were curtailed. A body prominent in advising on the usefulness of drugs and other health supplies was the Committee on Drugs and Medical Supplies of the Division of Medical Sciences of the National Research Council. Other aids were the 12th revision of the *United States Pharmacopeia,* the seventh revision of the *National Formulary* which became official in 1942 and *New and Nonofficial Remedies,* an annual publication of the Council on Pharmacy and Chemistry.

Research for agents to replace those curtailed by war resulted in the official recognition of the preparations totaquina, quinacrine hydrochloride (mepacrine hydrochloride, atabrine) and pamaquine naphthoate (aminoquine naphthoate, plasmaquin) as substitutes for quinine in the treatment of malaria.

Dicoumarin is a popular name for an agent capable of prolonging the coagulation time of the blood. It is very active and unless administered carefully can cause marked toxicity. At present it is in the stage of experimental investigation.

Mecholyl bromide is a synthetic parasympathomimetic dru
suitable for oral administration to combat certain chronic ulce
scleraderma, Raynaud's disease and other vasospastic conditio
of the legs.

Nikethamide, chemically related to nicotinic acid, a compou
with vitamin activity, is a central nervous system stimulant. C
injection it may cause an increase in blood pressure, some cardi
stimulation and relief of certain types of respiratory distress.

The treatment of high blood pressure (hypertension) was
1942 undergoing active investigation. Of the many agents in u
the more interesting, because of their novel character, were e
tracts of the kidneys. While the results of such therapy in a
mals evoked considerable speculation, final evaluation for h
mans must rest on much more work.

Antibacterial agents received special attention, undoubtedly b
cause of their importance to industry and the armed forces. T
sulphonamides, which had been synthesized, numbered in t
thousands, but only a comparative few showed promise. The be
ter known of these included sulphanilamide, sulphapyridine, su
phathiazole, sulphadiazine, sulphaguanidine, sulphacetamide a
sulphasuxidine. All might be administered orally; three (sulph
nilamide, sulphathiazole and sulphadiazine) were widely used f
external application as the powder, in solution or in ointment
three were available also as the soluble sodium salts for intr
venous injection. Orally, the drugs were used according to the
effectiveness to combat streptococcal infections, staphylococc
infections, pneumonia, gonorrhoea, meningitis, dysentery and oth
infections. Externally, some were used to prevent and treat infe
tions following operations, accidents and war injuries. While u
of the powder or crystalline forms seemed well defined, inc
poration in ointments required much investigation. Sulphadiazi
in solution for local use as a spray received considerable attenti
as a preventive against infection in the treatment of burns.

One of the newer classes of antibacterial agents was known
quaternary ammonium compounds. An example was Zephir
Chloride, which may also be called a cationic detergent, posses
ing low surface tension and keratolytic and emulsifying actio
These properties favour penetration into tissue surfaces. Unfo
tunately, soaps which are anionic detergents may reduce t
germicidal activity of this preparation. Also of interest was
report warning against the promiscuous use of wetting age
(agents which lower surface tensions); such agents may low
tissue permeability, which is a protective mechanism, so that t
skin may be rendered completely permeable to many agents.

The local application of zinc peroxide was receiving some a
tention in the treatment of infections due to anaerobic organism

Syphilis and gonorrhoea were coming under ever-increasi
control through the development of proper preventive measur
the judicious use of the sulphonamides and antisyphilitic co
pounds. Whereas the treatment of gonorrhoea was formerly
cumbersome and tedious task, the sulphonamides lessened t
treatment period to. days. Syphilis treatment was also faci
possible drastic change if the new intensive treatment prov
safe and practical. This treatment which consisted of hospital
ing the infected person and administering intravenously an an
syphilitic agent more or less continuously for several days w
expected to reduce the treatment period to a matter of da
instead of months and even years.

Certain extracts of bacteria and allied forms of life may of
potent new anti-infective agents. Proactinomycin acts agai
gram-positive organisms and the Neisseriae but is more toxic th
penicillin, the extract of mould developed by Fleming of Engla
and found to inhibit the growth of staphylococci, streptococ
pneumococci and some other organisms. Gramicidin, an extra
of a soil bacteria, received some clinical application and sho

omise. Tyrocidine and tyrothricin (a mixture of tyrocidine d gramicidin) were also effective in some respects. However, st of these preparations were difficult to make and were avail- e only in small quantities for experimental use. Some were ite toxic, but all needed much more laboratory and clinical rk before final evaluation was possible.

Nasal inhalant preparations containing petrolatum were omitted m *New and Nonofficial Remedies* because of the potential nger of lipoid pneumonia.

In the field of pain-relieving agents, Demoral was made avail- e for the medical profession. Sold on the European and South nerican continents as Dolantin, this agent was added to the dical armamentarium of the U.S. as a possible substitute for rphine with less addicting potentialities. (*See* also DENTISTRY; EDICINE; PNEUMONIA; SURGERY; UROLOGY; VITAMINS.)

(A. E. SH.)

hemurgy. The largest production in history of domestic vegetable oils, the greatest progress towards ob- ning rubber from domestic agricultural sources, and the first lization of milkweed fibre, were among the striking advances 1942 in the various fields of chemurgy. War-made shortages rred intensive efforts to develop sources within the United ates of a wide variety of important materials.

Soybean production was nearly doubled. Although the 1941 op of 106,700,000 bu. was regarded as phenomenal, year-end ports indicated that the 1942 crop was nearly double that. Un- vourable harvesting weather had left many of the beans still the fields in midwinter, but if not too wet, they could still be covered. This crop aided substantially in averting more serious ortages in oils, both for foods and for industrial uses. Soy oil ints, soybean adhesives and other industrial products were even in demand far above supply.

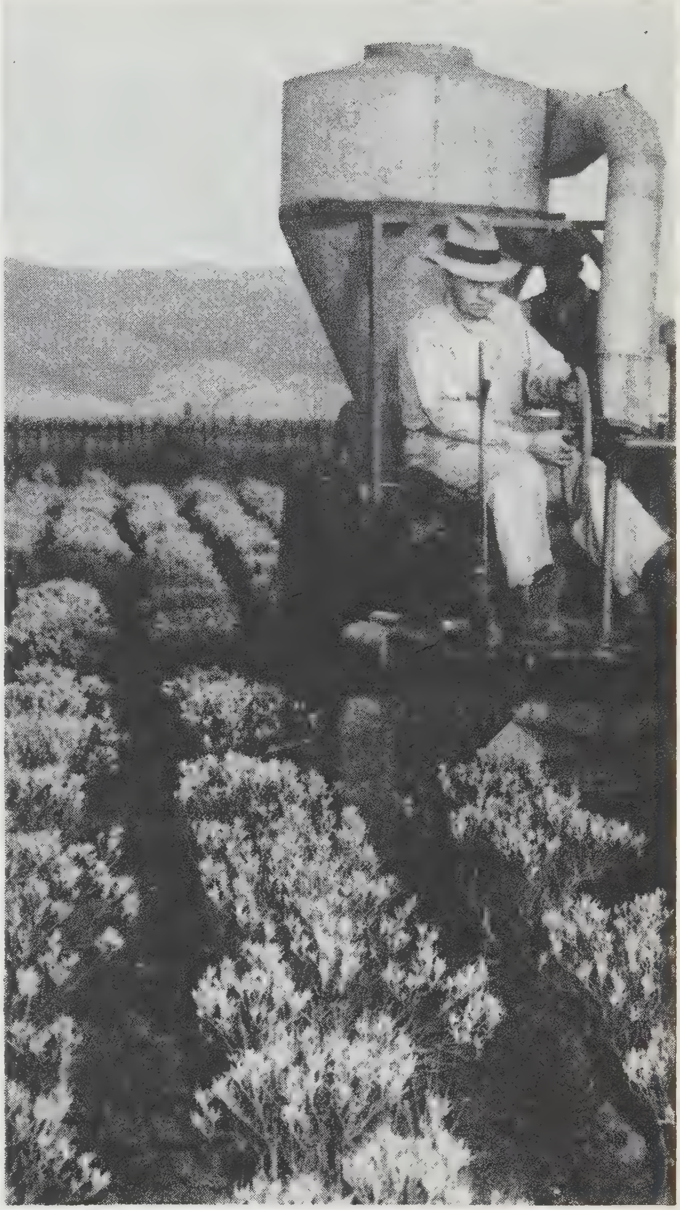
Also nearly doubled was production of peanuts, mainly for od oils. The 1942 crop was nearly 3,000,000,000 lb., in contrast a figure of slightly less than half of that the previous year.

Western flax areas stepped up production for linseed oil, while Minnesota-Iowa area maintained its former level.

With no tung oil being received from the orient, castor bean mand was far beyond supply. By dehydration castor oil is de into a near-equivalent for most of tung oil's uses. A new ocess for degumming castor oil, thus making it better for lubri- ting purposes, was announced. The oil has value in lubrication cause it withstands high temperatures. The government en- uraged castor bean production for the purpose of laying up a re of seed for 1943 plantings.

Domestic production of natural rubber came a little closer th advances in guayule and in kok-sagyz. Rubber by way of tadiene made from grain alcohol was advanced to a point where year-end saw a government-sponsored plant about to begin oduction. The year saw a violent controversy as to whether bber should be synthesized from petroleum or from grain- ohol, since the key chemical, butadiene, could be obtained m either source. The petroleum processes were preferred as ng further advanced, but it was decided to develop the alcohol ocess also. This was expected to afford an outlet for possible in surpluses after the war.

Guayule plantings were authorized on a scale which by 1945 ould occupy more than 500,000 ac. and yield more than 200,000 s of rubber. A number of extraction mills also were authorized.



GUAYULE SHRUBS under cultivation on an experimental farm in Salinas, Calif., in 1942. This plant, native to Mexico, was regarded as an important potential source of rubber for the U.S. after the Japanese conquest of Malaya and the Netherlands East Indies

This plant grows best in southern California, in Texas, New Mexico and Arizona. The crop was expected to yield 800 lb. or more of rubber per acre at the end of the second year of growth.

Upon the insistence of the National Farm Chemurgic council, government agencies in the spring obtained air shipment of 139 lb. of seed of kok-sagyz, the Russian dandelion, and later shipments by sea. This was planted, principally by the agricultural experiment stations, in 60 different places throughout the United States, including Alaska. At the year-end reports had not been compiled, but indications were that several of the plantings grew well. The roots, according to Russian information, yield from 30 to 200 lb. of rubber to the acre. Not until after another year, at least, of experiments would there be adequate basis for predicting whether this would be an important factor in the national rubber supply.

Experimentation with goldenrod as a rubber source, conducted during his latter years by Thomas A. Edison, was revived by the department of agriculture. Tests were made on 150 ac. near Savannah, Ga. The plant is said to grow best on poor soils, and to yield around 100 lb. of rubber to the acre.

Soybean oil appeared unexpectedly in the rubber picture when the Northern Regional Research laboratory announced a rubber-like product made by polymerization of the oil's fatty acids. Considered acceptable for gaskets, hose and similar purposes, a Detroit firm had initiated commercial production in late autumn, using the trade name "Agripol."

Deprived of kapok, the favoured material for life preservers and life rafts, the navy department turned to milkweed for an alternative product. A leading chemurgic investigator, Dr. Boris Berkman, had revealed in 1941 his discovery that the fibres of milkweed floss were not only hollow, and therefore highly buoyant, but also were coated with a wax which made them virtually impervious to water. At the request of the navy department a large quantity of milkweed floss was collected from wild plants in the vicinity of Petoskey, Mich. The floss was separated from the seeds by machinery devised for the purpose. Seeds were saved for establishing cultivated plantings, and some were used for further study of their oil content.

Fashion shows of 1942 displayed hats and ladies' garments made from "Aralac," the synthetic fibre derived from milk by way of casein. A 10,000,000-lb. output of this fibre was reported. Synthetic fibre from the proteins of soybeans was made at the rate of about 1,000 lb. daily in a pilot plant of the Ford Motor company.

Advances were indicated in production of several essential oil and drug crops, although labour shortages discouraged attempts requiring much hand work. Plastic production was in such demand that shortages of necessary chemicals became a factor. Surveys reported that cork trees, products of experiments started decades ago, were growing well and yielding good cork bark in several parts of the country, and hundreds of thousands of new seedlings were set out.

The scope of chemurgy embraces development of new uses for agricultural crops, establishment of practical new crops, and profitable uses for agricultural wastes. The clearing house for information on chemurgy is the National Farm Chemurgic council, 50 West Broad Tower, Columbus, O.

BIBLIOGRAPHY.—*The Chemurgic Digest,* published by the National Farm Chemurgic council; the *Agricultural Situation,* issued by the department of agriculture. Valuable general information on chemurgy is contained in *Pioneers of Plenty,* by Christy Borth, and in *Science Remakes Our World,* by James Stokley. (W. McM.)

Chennault, Claire L.

(1890–), U.S. army air officer, was born Sept. 6 in Commerce, Tex. A school teacher during World War I, young Chennault was called up for service in 1917 and served in the aviation section of the signal reserve corps in the United States. After the war, he became an officer in the army air corps and commanded a pursuit squadron in Hawaii, 1923–26. He retired from the army in 1937 and in the same year accepted General Chiang Kai-shek's offer to become aviation adviser to China; he then helped the Chinese to create an air force to fight the invading Japanese. In 1941, he founded the American Volunteer group of the Chinese army—a flying squadron of U.S. volunteer aviators who later became known as the "Flying Tigers." Though seriously hindered by inferior planes, the "Flying Tigers" reflected their superior training under Chennault by repeatedly repulsing Japanese air attacks on the Burma road—then China's lifeline. Chennault was called back to active duty with the U.S. army air force on April 16, 1942. He was promoted to brigadier general and in June 1942 was named commander in chief of the U.S. air task force in China. On July 4, his Flying Tigers were disbanded and its members were inducted into the regular U.S. army air corps. In Dec. 1942, Chennault was awarded the D.S.M. by Lt. Gen. Joseph Stilwell for meritorious service as commander of the Chi air task force.

Chess.

Samuel Reshevsky extended his reign of United Sta championship chess to six years by winning the 19 biennial tournament in a play-off with Isaac I. Kashdan. T two finalists ended the regular tournament with scores of 12 $2\frac{1}{2}$ each, Reshevsky with 10 wins and 5 draws and Kashdan wi 11 wins, 3 draws and 1 loss. In the play-off, which extended in the first week of 1943, the 31-year-old Reshevsky won in t 11th game by a $7\frac{1}{2}$–$3\frac{1}{2}$ score.

Dr. Alexander Alekhine, the Franco-Russian master, continu his rule as world champion. Dr. Alekhine competed in only o major tournament in 1942, a masters' test at Salzburg, Austr which he won. Of great interest to the masters' tournament f lowers was the individual victory of Karl Junge, 18-year-c Austrian, over Dr. Alekhine.

Aside from the nationals, the United States produced seve other tournaments sponsored by the U.S. Chess federation. open championship at Dallas, Tex., resulted in a tie betwe Herman Steiner of Los Angeles and Abe Yanofsky of Winnip the Canadian champion. The tie was not played off.

Two other contests were added to the annual program of t national federation. The national rapid transit championship, e bracing a time limit of 10 seconds per move, was won by Reub Fine of Washington, with Reshevsky the runner-up. The ot event, the national amateur, went to Edward S. Jackson, Jr., Philadelphia.

Miss N. May Karff of Boston regained and retained her wo en's national chess championship in 1942. She defeated M Donald Belcher of New York, 5–1, to regain her title and la successfully defended it without suffering a defeat in the Unit States Chess federation tournament.

Intercollegiate Chess.—Harvard replaced Yale as champi of the H.Y.P.D. College Chess league. Yale was runner-up, w Princeton third and Dartmouth last. City College of New Y won the Eastern Intercollegiate tournament, dethroning Brookl (M. P. W.)

Chiang Kai-shek

(1886–), Chinese general and stat man, chief of the ruling party, was ma after Pearl Harbor, commander in chief of the China theatre war, including Thailand and Indo-China. As the youngest of leaders of the four major allies of the United Nations, Chia early perceived World War II in its global perspective and his people the longest in constant and hard battles. After J 1937 Chiang repeatedly declared that China's fight against agg sion was related to the cause of the democracies and the libe tion of oppressed nations. Urging effective world co-operati during and after the war, Chiang emphatically stated on Nov. 1942, that China did not wish "the mantle of an unworthy Ja to fall on her shoulders" and thus had "no desire to replace we ern imperialism in Asia with an oriental imperialism or isolati ism of its own or of anyone else."

As a student of the preparatory military academy and the m tary staff college in Japan from 1907–10 Chiang acquired a p etrating knowledge of Japan, but his early contact with the w was his trip to Russia in 1923 as Sun Yat-sen's representati Through his marriage to Mei-ling in 1927 Chiang not only all himself with the influential Soong family but also became quainted with western ways and thought. After 1927 he was c tinuously in power, and after the Sian incident of 1936 beca the centre of all political groups and leader of the whole nati Being Tsung Tsai of the Kuomintang, premier, commander chief of all the military forces, chairman of the Supreme onal Defense council, which is the highest political organ for osecuting the war, president of the combined national central nks, chairman of the Central Planning board, and originator d executor of the general mobilization program and intensified ntrol of commodity prices after Pearl Harbor, Chiang was im- owered to expedite the dual program of resistance and recon- ruction as well as to share in the struggle of the United Nations.

Bibliography.—R. Berkov, *Strong Man of China;* Hollington Tong, *iang Kai-shek;* Frank Price (trans.), *China Fights On* (War Message Chiang); Chiang Kai-shek, *All We Are and All We Have* (War Message ter Pearl Harbor). (H. T. Ch.)

hiang Kai-shek, Madame (Soong Mei-Ling) (1898–), wife of General hiang Kai-shek, Chinese leader, was born in Shanghai, daughter Charles Jones Soong of the wealthy Soong family. One of ree famous sisters, she was educated in the United States and as graduated from Wellesley college in 1917. Returning to hina, she served on the China Labour commission, the first oman ever appointed to this agency. She married Chiang in 927. When her husband was kidnapped by Chinese rebels in 936, she flew to their Sian stronghold, persuaded them to release hiang and was instrumental in convincing him to forge a united ont with the Chinese communists who wanted to halt Japanese ncroachments in China. A strong and vivid personality, Mme. hiang helped stir Chinese resistance against the Japanese inva- on. She placed thousands of war orphans into homes, resettled efugees from war zones and established clean hospitals for ounded soldiers. She was a devoted worker in the cause of emancipating Chinese women from their virtual slave status. Mme. Chiang went to Washington in Nov. 1942 to undergo medical treatment for injuries suffered in a motor car accident five years earlier.

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., at the southwest corner of Lake Michigan, Chicago is the largest centre of U.S. rail traffic and of long-distance air routes. The port of Chicago is mainly important because of a great tonnage of iron ore, fuel and fluxes for steel manufacturing, conveyed by lake ships, and for oil products conveyed by tanker barges and ships. It has access to the Gulf of Mexico via the Illinois waterway and the Mississippi river, and to the Atlantic via the St. Lawrence river and the Welland canal, but both routes can accommodate only small ships.

The population of the city proper by the federal census of 1940 was 3,396,808, which included 1,686,648 males and 1,710,160 females. The white population numbered 3,115,379; nonwhite, 281,429. The population of the 1,119 sq.mi. comprising the metropolitan district was 4,499,126. In 1942 the departure of more than 175,000 men to armed services was offset by influx of workers to war industries and by military and naval personnel concentrated in Great Lakes Naval Training station and other establishments. The 1942 census bureau estimates placed the population of city proper at 3,545,808. The birth rate rose rapidly from the beginning of 1942, and births officially recorded in the first eight months of the year were 4,607 more than in 1941. Marriage licences issued totalled 45,771, a number second only to the 48,317 in 1941. Mayor (Jan. 1, 1943): Edward J. Kelly (Dem.).

ENDELL L. WILLKIE greeting Mme. Chiang Kai-shek and her husband in hungking, where he arrived Oct. 2, 1942, during his world-encircling inspec- on tour

Manufacture of war supplies absorbed more and more of Chicago's labour and plant facilities in 1942. Government expenditure for war supplies from June 30, 1940, to the end of 1942 was about $3,657,539,000, including new plant construction. Military secrecy veiled about $1,800,000,000 of that sum, but the remainder was under 8,118 contracts with 1,756 concerns. Increase of workers employed in all industries was 196,407 to a total of 680,000. New plants included the largest aeroplane engine factory in the world and two others among the largest. A bomber plant, a cargo plane factory, a factory for the fabrication of aluminum, new foundries for casting tank parts and an armour plate mill were wartime additions to Chicago's industry. Each of these units was one of the largest of its type ever designed.

Until the suspension of voluntary enlistments in Dec. 1942, recruiting for all branches of the armed services was at high pitch in Chicago. The city led all the 14 navy recruiting stations for naval aviation, with 6,014 fliers enlisted. The civilian defense organization of Chicago embraced 420,000 citizens. During the year collections of scrap materials for war industry totalled 1,175,000 tons.

Increased employment reduced the number of city relief cases to 36,805, and federal relief agencies were virtually liquidated. Military priorities on construction materials and shortage of fuel and rubber halted transportation improvements, and the transit systems were carrying 16% more passengers at the end of the year than at the close of 1941.

Chicago's tentative budget for 1943 was $160,800,520, in addition to which the school system budget called for $70,977,989, the park system $23,023,763 and the Chicago sanitary district $40,115,915.

In the elections of 1942, Chicago remained in the Democratic column by greatly reduced pluralities. The vote cast was the lowest since 1930, only 76.76% of the voters participating. In Chicago, U.S. Senator C. Wayland Brooks, Rep., who received a plurality of 202,876 in the state as a whole, got only 581,811 votes to the 759,570 cast for Raymond S. McKeough, Dem. All local candidates of the Democratic organization were elected.

Three of the city's largest hotels were taken over by the army in 1942 and many other structures, including Navy Pier, passed to military uses. Removal of U.S. civil bureaus to Chicago from Washington continued, and the number of civil service employes so transferred reached 14,000.

Reduction of automobile traffic in 1942 because of oil and tire conservation reduced traffic fatalities by 25% from the previous year's toll. Despite reductions in liquor licenses and other excise revenues, tax collections in Cook county were the highest in 15 years. Real estate, personal property and railroad taxes collected mounted to $188,888,005 a sum equivalent to 85.05% of the total levy and an annual gain of $10,420,922.

(L. H. L.)

Chicago, University of. An institution of higher education and research in Chicago, Ill. Founded in 1891, the university is privately endowed, co-educational and nonsectarian.

Degrees were conferred upon 1,676 candidates in the academic year, of which 707 became bachelors of arts, science or philosophy, 518 became masters of arts, science or business administration, 404 were awarded doctorates in philosophy, medicine or law, and 37 received professional degrees in law or divinity.

The total income of the several divisions of the budget, excluding income from auxiliary enterprises and restricted expendable funds, was $8,286,992, $284,898 less than the income of the previous fiscal year. The year's total of gifts paid in was $2,271,425. For additional statistics of enrolment, faculty members, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGE

Another step in the educational reorganization of the universit was taken in Jan. 1942, when the faculty voted to award th bachelor's degree upon completion of liberal education. The co lege administering liberal education is a four-year institution, b ginning at the level of the traditional junior year in high scho and ending at the sophomore year of the conventional colleg Students are admitted to it at the start of the program; hig school graduates enter it in the middle, for the last two years.

Navy signal and radio schools, training of meteorologists, specialists in high frequency, of army laboratory clinical admi istrators and other technical fields involved large numbers of th services and used extensive sections of the university's building In addition, 2,750 students completed war courses sponsored b the U.S. Office of Education. The university's institute of milita studies gave approximately 4,500 men training in its basic an specialized military course.

Children's Books. The year 1942 in the United States wa characterized by an increase of materi relating, directly or indirectly, to World War II, including hi torical fiction with liberty and democracy as the theme, bot fiction and factual material about the United Nations, book about the war itself, and books stressing American ideals. Th interest in Latin America continued; and the flow of biographie and vocational stories seemed undiminished. Good humorous an imaginative stories balanced the more serious tendencies, an there was an unusual increase in the number of toy and tric books. A larger number of books than usual went out of prin The "comics," though not literature, are definitely a part o children's reading, and the year showed no decline in their nun bers or popularity.

Among picture books were Virginia Lee Burton's *The Litt House,* Mary and Conrad Buff's *Dash and Dart, The Fast Soone Hound* by Arna Bontemps, Clare Newberry's *Marshmallow* William Robinson's *At the Seashore,* Holling Holling's *Tree in th Trail* and Marie Gilchrist's *The Story of the Great Lakes.*

Good historical stories included Elizabeth Gray's *Adam of th Road,* Rosamond Marshall's *None But the Brave,* Florence Upde graff's *Traveler's Candle,* Erick Berry's *Hudson Frontier;* als Lena Barksdale's *The First Thanksgiving,* Herbert Best's *Gun smith's Boy,* Isabel McMeekin's *Journey Cake,* Evelyn Sickels *The School Bell Rings* and Hildegard Woodward's *Jared's Bles ing.*

Stories which pictured American life were John Tunis's *Al American,* Elizabeth Coatsworth's *House-boat Summer,* Phyll Crawford's *Last Semester,* Eleanor Estes' *The Middle Moffa* Eleanor Lattimore's *Storm on the Island.* Anne Locklin's *Tide water Tales,* Eliza Orne White's *Training Sylvia,* Laura Wilder *These Happy Golden Years;* others were Valenti Angelo's *Hill o Little Miracles,* Florence Means' *Shadow Over Wide Ruins,* Hop Newell's *Steppin and Family.*

Books about the allied nations included *Happy Times in Nor way* by Sigrid Undset, *Smoky Bay* (Iceland) by Steingrimu Arason, *The Gift of the Forest* (India) by R. Lal Singh, an *Andries* (Holland) by Hilda Van Stockum.

Stories with a war background were Hortense Flexner's *Th Wishing Window* (France), Eleanor Lattimore's *The Question of Lifu* (China) and Marie McSwigan's *Snow Treasure* (Norway)

Books with a patriotic purpose included Ingri and Edga d'Aulaire's *The Star Spangled Banner,* Carl Carmer's *Americ Sings, Songs of Freedom,* compiled by Archibald Davison an thers, *The Birth of a Nation's Song* by Katherine Bakeless, Iunro Leaf's *A War-time Handbook for Young Americans.*

Books about Latin America were Alice Dalgliesh's *They Live in outh America,* Marion Lansing's *Against All Odds,* and *The atin American Song Book* by Emilio de Torre; about Mexico: ernal Diaz' *Cortez and the Conquest of Mexico,* Anita Bren-er's *The Boy Who Could Do Anything,* and Berta and Elmer Iader's *The Story of Pancho and the Bull with the Crooked Tail.*

Biography included Mabel Hunt's *Have You Seen Tom humb?,* Howard Fast's *Goethals and the Panama Canal* and hannon Garst's *Kit Carson.*

Other non-fiction: Louise Lamprey's *Building a Republic,* Iinoo Masani's *Our India,* Helen Follett's *Ocean Outposts,* orothy and Nils Hogner's *The Animal Book,* Henry Kane's *The ale of the Promethea Moth,* Carroll and Mildred Fenton's *Iountains* and Herbert Zim's *Mice, Men and Elephants.*

Folk tales included James Bowman's *John Henry,* Harold Cour-ander's *Uncle Bouqui of Haiti,* Berta Metzger's *Picture Tales rom India,* Eileen O'Faoláin's *King of the Cats* and Leich Peck's *on Coyote.* Fantasy was found in Walter de la Mare's *Mr. umps and his Monkey,* Patricia Gordon's *Not-Mrs.-Murphy,* nys Tregarthen's *The Doll Who Came Alive* and Janette Low-ey's *Tap-a-Tan.*

There were new editions of Hans Christian Andersen's *The now Queen,* illustrated by George and Doris Hauman, of Peter rshoff's *The Little Magic Horse,* illustrated by Vera Bock, and f Andrew Lang's *Prince Prigio,* illustrated by Robert Lawson; elections from the Bible in *Favorite Psalms for Children* illus-rated by Marie Stern, and *Jesus' Story* illustrated by Maud and Iiska Petersham; selections from Bulfinch's *Age of Fable* illus-rated by Helen Sewell.

A new series of books for small children, The Little Golden ibrary, edited by Mary Reed, was a noteworthy contribution in he field of inexpensive books. (*See* also LITERARY PRIZES; PUB-ISHING [BOOK].) (S. AN.)

hildren's Bureau, United States: *see* CHILD WELFARE; UVENILE DELINQUENCY.

hild Welfare.

National recognition in the United States was given to the wartime problems of chil-lren by the children's bureau Commission on Children in War-ime which, meeting for the first time in March 1942, adopted Children's Charter in Wartime. This charter called upon all itizens to "guard children from injury in danger zones; protect hildren from neglect, exploitation, and undue strain in defense reas; strengthen the home life of children whose parents are nobilized for war or war production; and conserve, equip, and ree children of every race and creed to take their part in lemocracy."

The charter urged that health, school and recreation facilities n the overcrowded military and war-production zones be strength-ened; that the home life of children of servicemen and war vorkers be stabilized through economic provisions, insurance rograms, adequate housing and day-care services; and that hildren throughout the U.S. should be safeguarded against suf-ering as a result of wartime food shortages, that they be helped o meet the emotional strain and excitements of war without rejudice to their development, and that ways be found for hem to participate in the war effort through activities suited to heir age and ability.

The U.S. government recognized, without waiting for the nainland to be subjected to enemy attack, the necessity for areful preparation and constant vigilance. Measures for civilian rotection, civilian assistance, and evacuation of children and others from target areas in case of military necessity were developed. Of more immediate importance to children in the United States, since they, up to the close of 1942, were spared actual bombing and destruction, were the suggestions given to parents and others responsible for the care of children for their psychological and emotional guidance in helping them face the difficulties of wartime.

Health of Mothers and Children.—(*See* also BIRTH STATISTICS; INFANT MORTALITY.)

The maternal and child-health services and the services for crippled children administered by the children's bureau under title V, parts 1 and 2 of the Social Security act, were in operation during 1942 in all 48 states and in the District of Columbia, Alaska, Hawaii and Puerto Rico. Federal appropriations for grants to the states for these two programs were $5,820,000 and $3,870,000, respectively.

Expansion of war industries and establishment of military camps and bases resulted in increases in the number of women and children, as well as men, living in more than 400 areas in the United States involving 800 counties. Many of these areas were not previously provided with maternal and child-health services and there was increasing evidence during 1942 that with growing population maternal and child-health needs were not being met. In Jan. 1942 it was reported that the state health departments had been able to give some—though insufficient—additional maternal and child-health service in 165 counties in which there were defense activities. In a later canvass the state health offices of 32 states reported 366 defense areas in which maternal and child-health needs were unmet. Often, it was reported, funds were not available to purchase equipment for prenatal and child-health conferences or to pay personnel to conduct these conferences and to maintain the other medical, dental, nursing and nutrition services that were urgently needed. The withdrawal of doctors and nurses for the armed services heightened the need. It became increasingly important that the time of those who were still available for civilian service be conserved by the clinic and conference method so as to serve groups of mothers and children, and to provide the preventive service that would maintain health and forestall illness.

Bills introduced in congress, on recommendation of the president, to amend title V of the Social Security act by authorizing additional appropriations to meet the special needs of mothers and children arising from war conditions, were not acted upon. So far as possible, however, services were adapted to meet wartime needs. (*See* also SOCIAL SECURITY.)

In the maternal and child-health program, increased attention was given to medical and hospital care for maternity cases and for sick children. In 26 states and Hawaii plans were approved in 1942 for providing maternity care to wives of men in the armed forces, and medical care for their infants. Preventive health services were stressed as a guard against wartime epidemics. A special campaign was carried on in connection with May day —Child Health day for the immunization of children nine months of age and over against smallpox and diphtheria. As a result state health departments reported nearly three times as many vaccinations against smallpox and more than twice as many immunizations against diphtheria as in the previous spring.

The number of crippled children on state registers reached 340,692 on June 30, 1942—an increase of 11% over 1941. Programs were maintained in operation in every state and territory, although the assignment to military services of orthopaedic surgeons from state staffs made it necessary in some states to postpone corrective work of certain types or to send children to other states for orthopaedic surgery.

Nutritional levels were not affected by the rationing, on a comparatively liberal basis, of sugar and coffee. Many families were able to purchase more and better food as a result of improved employment conditions, although, in some areas local shortages of milk and other essential foods made it difficult to obtain all the foods needed for healthy growth. Nutrition committees affiliated with state defense councils continued to develop the national nutrition program sponsored by the Office of Defense Health and Welfare Services. School-lunch programs and projects supplying milk and other foods for school children were, for the most part, continued although the order of the president in December providing for the termination of the activities of the Work Projects administration left the future of these projects in doubt.

Care of Children of Working Mothers.—Care of children of mothers employed in war industries or in occupations where they relieved men for war service was recognized as a problem of major importance. The War Manpower commission issued a policy statement recognizing that a mother's first responsibility is toward her children and discouraging active recruitment of women with children until all other sources of labour supply are exhausted. Nevertheless the 3,000,000 women added to the labour force during 1942 included a considerable percentage of mothers with young children. Local surveys in more than 300 communities showed numbers of young children left without care during the day, children locked out of their homes, and children kept home from school to care for younger children while their mothers work.

Consultation service to states and communities planning day-care programs was offered by the children's bureau and the office of education through regional consultants. Through the Office of Defense Health and Welfare Services limited federal funds were available to supplement state and local funds where necessary in establishing child-care programs. Federal funds could be used in promoting and administering child-care plans submitted by state welfare departments and recommended for approval by the children's bureau or submitted by state education departments and recommended for approval by the United States office of education. By the middle of Jan. 1943 plans had been approved for 24 states—12 submitted by welfare and 12 by education departments. In addition, funds for the operation of local services were made available by the Federal Works agency under the Work Projects administration (to be terminated in 1943) and the Lanham act.

Child Welfare Services.—Child-welfare-service programs carried on by the states in co-operation with the children's bureau after 1935 under title V, part 3 of the Social Security act continued in operation throughout 1942 in all states and territories, the federal appropriation for grants to states being $1,510,000. Approximately 50,000 children were receiving case-work service through this program in May 1942.

Under plans approved by the children's bureau for the year beginning July 1, 1942, 326 full-time and 43 part-time child-welfare workers paid in whole or in part from federal funds were provided for in 281 defense counties; these plans offered additional evidence of the inadequacy of child-welfare services in the country.

Juvenile Delinquency.—(*See* JUVENILE DELINQUENCY.)

Public Assistance.—The program for aid to dependent children administered by the Social Security board under title IV of the Social Security act was in operation in 45 states and in the District of Columbia and the Territory of Hawaii during 1942. Monthly payments in Oct. 1942 amounted to $12,800,000 and were made to nearly 900,000 children.

A new source of assistance was opened up for families of men in the armed forces by the Servicemen's Dependents Allowance act of 1942. This provided monthly allowances and allotmen amounting to $62 for a wife and one child and $10 for ea additional child. If there is no wife, the amount is $42 for t first child and $10 for each additional child.

Funds for providing civilians with temporary aid necessitate by enemy action were made available by the president throug the Federal Security agency pending the enactment of legislatio The civilian war assistance program provided immediate assis ance and welfare services for civilians and their families, ar the civilian war benefits program provided monthly paymen for injured persons and for dependents of persons killed. The programs were administered by the Social Security board wit the co-operation of state welfare departments. (*See* also SOCIA SECURITY.)

Child Labour and Youth Employment.—The steadily increa ing tempo in the production of war materials affected industri conditions for all workers, including children and young person Young workers under 18 were increasingly in demand to me the mushrooming labour needs of new population centres f workers in stores and service trades, for jobs in war plants, f the cultivating and harvesting of crops, and to take the places workers drawn into war industries and the armed forces.

Employment of Children in Agriculture.—Because of labou scarcity and the need for greater production of food, organize programs to employ nonfarm youth under 18 years of age i agriculture were widespread in 1942. The largest number we placed as day workers, the farmers collecting young workers a the employment-service office, schools, and other central point and returning them at the end of the day. Others were place on the farms where they were to work. In addition, there we many programs to recruit young people from cities and tow to live in work camps in the area where they were to be employed. Though much of the employment was during the scho vacation, a great deal in the spring and fall involved release o children from school. Two states, New York and New Jerse enacted legislation permitting children 14 years of age and ov to be excused for work in agriculture for 30 and 15 days, r spectively, and in a number of other states release of scho children for farm work was provided for through executive o administrative orders.

Standards to safeguard the health and welfare of young eme gency farm workers were developed and promoted by th children's bureau of the United States department of labour i co-operation with other federal, state and private agencies. A outline of general policies on recruitment of young workers fo wartime agriculture, issued by the bureau, was prepared in co sultation with the United States office of education, the Unite States department of agriculture, and the United States employment service.

Federal Legislation.—The child-labour provisions of the Fai Labor Standards act of 1938 provided federal safeguards fo children and young persons under 18 years of age employed i establishments producing goods for shipment in interstate com merce. These provisions affected most work in manufacturin establishments because the great majority of such establishment in the United States carried on an interstate business. The basi 16-year minimum-age standard provided in this act was, therefore, of great value in preventing a large influx of 14- and 15 year-old workers into factory employment.

These provisions were administered by the children's burea which continued and strengthened its co-operative programs wit the state and local agencies administering state child-labour laws Employment and age certificates issued under state law wer accepted as proof of age under the Fair Labor Standards ac in 44 states, the District of Columbia, Hawaii and Puerto Rico deral certificates were issued in four states—Idaho, Mississippi, uth Carolina and Texas—with the co-operation and assistance state and local officials.

In connection with the enforcement of the wage and hour ovisions of the Fair Labor Standards act, prohibitory home-ork regulations were issued in five industries (jewellery, gloves d mittens, knitted outerwear, apparel, and buttons and buckles) d were under consideration for two others. The legal basis these prohibitions was to prevent evasion of the established inimum wage.

The great increase in the production of war materials for the vernment increased the importance of the regulation of emoyment of minors under the Public Contracts act. This act t up, among other conditions of employment, a minimum age 16 for boys and 18 for girls, to be complied with by all nployers producing goods under contract for the United States the value of more than $10,000. Under power given by the t, and at the request of the federal departments most concerned war production, the secretary of labour in Nov. 1942 reduced e minimum age for employment of girls from 18 to 16, but the same time set up certain special safeguards as to hours d conditions of employment of girls 16 and 17 years of age. s 16 years is the minimum for boys under this act and for th boys and girls under the Fair Labor Standards act, the tablishment of the same minimum age under both acts was pected to prevent confusion and difficulty of administration in e many factories subject to both laws.

Protection from Hazardous Work.—Special attention was given the children's bureau to measures to protect young workers om hazardous employment. A minimum age of 18 for employent in occupations involving exposure to radioactive substances as established in May 1942 under the Fair Labor Standards t after investigation and a public hearing. Standards as to pes of employment suitable for young workers of 16 and 17 a number of war industries were being developed by the ureau, and their voluntary observance by employers was urged. nese advisory standards gave information on the hazards of e occupations to which they related, suggested the types of ork in which 16- and 17-year-old persons might be employed th comparative safety, and pointed out the types of work from nich they should be excluded. The industries dealt with during 42 included shipbuilding, lead and lead-using industries, and nployments involving exposure to chlorinated solvents and to rbon disulphide.

State Legislation.—In Louisiana and in Puerto Rico new childbour laws were passed in 1942 which established a basic 16-year inimum age, replacing a 14-year minimum; required certificates to 18 years of age; established standards for work in street ades; and set a minimum age of 18 years for work in a nsiderable number of hazardous occupations.

A National Program.—Certain standards formulated and urged federal agencies exercised considerable influence in maintaing good child-labour conditions in types of employment not subct to the specific federal acts mentioned above. Early in 1942 conference of federal departments and state labour departments war production states, called by the secretary of labour to scuss means of increasing production, agreed on a statement of tional policy which pointed out that although some relaxations hours-of-labour standards might be necessary, there must be relaxation of standards governing employment of minors der 16.

The Ninth National Conference on Labor Legislation, in aking recommendations at its annual meeting in Nov. 1942, lled attention to the necessity for careful planning and guidce in the employment of 14- to 18-year-old youths, and for adherence to certain standards. These were that children under 14 should not be part of the hired labour force, that none under 16 should be employed in manufacturing, and that young persons 16 and 17 years of age whose work is essential should be placed only in occupations suited to their age and capacity.

Program of State Action for Children in Wartime.—In Aug. 1942 the children's bureau Commission on Children in Wartime drew up, in consultation with the Office of Defense Health and Welfare Services and the Office of Civilian Defense, and adopted a "Program of State Action for Our Children in Wartime." This program outlined 10 subjects needing review in every state and community, and recommended fixing responsibility for study and planning on representative state and local committees on children in wartime, preferably affiliated with defense councils.

Through the co-operation of the Office of Civilian Defense this program of state action was widely distributed to civilian defense councils and public officials. In 34 states and more than 250 local communities, committees concerned with the general problems of children in wartime or dealing exclusively with the problems of children of working mothers were helping to develop comprehensive programs drawing together all the agencies and resources that could contribute toward meeting these child-care needs.

Inter-American Co-operation.—The Eighth Pan American Child congress met in Washington, D.C., in May 1942[1] at the invitation of the United States government. The chief of the children's bureau was elected president of the congress. The congress devoted much of its time to the consideration of methods of inter-American co-operation and the importance of maintaining services for mothers and children in wartime and formulated a declaration of opportunities for children, signed by the chairmen of the delegations from the 21 American republics. The American International Institute for the Protection of Childhood, with headquarters in Montevideo, Uruguay, and the governments of several American republics took action on some of the resolutions passed by the congress.

Child Welfare in the American Republics.—In the American republics new developments were noted in social insurance, nutrition, health education, including education in child care, and other fields. The First Inter-American Conference on Social Security, which was held in Santiago, Chile, in Sept. 1942 recommended among other subjects the establishment of welfare services for mothers and children within the framework of social insurance.

In Costa Rica the social-insurance law of 1941 became operative in part of the country, and in Ecuador the law of 1942 replaced a law of 1935. In both countries insured persons receive medical care and cash benefits in case of illness, childbirth and other contingencies. The importance of disease prevention was also stressed in these laws. In Mexico a social-insurance bill was introduced in congress in Dec. 1942. In Argentina and Cuba measures were taken for improving the administration of the laws on maternity insurance.

The interest in nutrition continued to increase. In Brazil the Social Insurance Nutrition service, established in 1941 for the workers protected by the pension insurance laws and for their families, opened in 1942 restaurants where nutritious meals were served at low cost.

The Federal Children's bureau of Brazil selected "Better nutrition of children" as the subject of the 1942 Children's week, and a campaign to arouse public interest was conducted. In Mexico City the government opened the first of a projected chain of dining halls where people in the low-income groups could get balanced meals at nominal cost. The National Commission on Foods of the Federal Department of Public Health of Mexico introduced properly balanced meals in public child-welfare institutions and in government-supervised foster homes. In Venezuela a Division of Nutrition was set up in 1942 in the ministry of health and social welfare.

---

[1] The previous congresses were held as follows: Buenos Aires, Argentina, 1916; Montevideo, Uruguay, 1919; Rio de Janeiro, Brazil, 1922; Santiago, Chile, 1924; Havana, Cuba, 1927; Lima, Peru, 1930; and Mexico City, Mexico, 1935.

A "center for the education of mothers" in child care was established in 1942 in Lima, Peru, under the National Institute of the Child, official agency administering child-health work throughout the country. In Haiti a law of Jan. 10, 1942, made primary education compulsory for children 7 to 14 years of age, with some exemptions.

In Panama an "institution for child supervision and protection" to be established under a presidential decree of July 22, 1942, was to deal with children under 16 years of age who were accused of illegal acts or who were neglected, destitute and mentally defective.

Great Britain.—*Child Welfare.*—With the increasing employment of mothers in war industries the care of young children became a subject of national importance. Government agencies co-operated in the setting up of war nurseries and nursery schools, which were maintained by the national government.

Child welfare also received attention in postwar reconstruction plans. The Beveridge report, published and presented to parliament in Dec. 1942 under the title "Social Insurance and Allied Services," proposed the extension of the system of social insurance in Great Britain, including maternity benefits, children's allowances, widows' pensions, and complete medical care. (*See* also SOCIAL SECURITY.)

Child Labour.—The imperative war necessity in Great Britain to secure greater national production brought into employment a large number of children who would otherwise have continued in school beyond the legal school-leaving age (14), and also led to more arduous conditions of work for children and young persons between 14 and 18 years of age. However, efforts to keep schools open and to require attendance of children up to 14 were renewed in 1941 and 1942, and appropriations for education were increased after the beginning of World War II.

Hours of employment for young persons between 14 and 18 years of age were regulated by the Factories act of 1937 and emergency orders issued thereunder by the ministry of labour and national service. The standard was a maximum 9-hour day and 44-hour week for children 14 and 15 years of age, and a maximum 9-hour day and 48-hour week for boys and girls 16 and 17 years of age and for all women, with provision for overtime under certain conditions. Night work between 6 P.M. and 7 A.M. was prohibited for children under 16.

Under the general emergency order for engineering and certain other classes of work, as extended on April 28, 1942, establishments doing emergency work might obtain special permission to employ young persons between 16 and 18 years of age and women up to 60 hours a week and children 14 and 15 up to 48 hours a week. The number of permissions under this order in the early part of 1942 was approximately 9,000, nearly double that for 1940. The permitted hours in the majority of cases were less than 55, and the tendency at the end of 1942 was toward shorter hours.

An order of Jan. 23, 1942 authorized district inspectors of factories to permit in all types of factories the extension of hours of work above the statutory limit, but not to exceed 55 hours a week for young persons between 16 and 18 and women. Not more than ten and one-half hours might be worked on any week day; Saturday hours as high as eight might be specially sanctioned by the district inspector. For children under 16 the statutory 44-hour work week might be lengthened to 48 hours.

By a special order in council, school authorities were permitt in 1942 to exempt from school attendance children of 12 a over under certain safeguards, to help with urgent agricultur work if other labour was not available. Absences were limit to 10 full or 20 half school days a year, with maximum worki hours of seven hours on full days, four hours when a half d is spent in school, and with a break of at least one hour aft not more than four hours of work. No further exemptions we permitted except upon permission of his majesty's inspectors.

Australia.—Pensions for widows and for divorced and desert wives with one child under 16 years were made available Australia under a commonwealth law effective July 1, 1942; f children after the first, allowances were paid under the Chi Endowment act of 1941.

Continental Europe.—The information coming from Europe countries concerning labour conditions emphasized acute labo shortages and the heavy demands that drew upon workers of ages, but for the most part did not touch particularly up employment of children. In the spring of 1942 it was report that in Germany children ten years of age and over were to sent to camps in farm areas to work in the fields.

Concern for the health of working mothers was evidenced an administrative order in Germany, effective July 1, 1942, whi prohibited the employment of women in any occupation for weeks before childbirth; previously, the prohibition applied women in industry only. Employment for 6 to 12 weeks aft childbirth was also prohibited. The mothers were to recei full pay during maternity leave and, in some cases, nursi benefits. Expectant and nursing mothers were not to be employ overtime, or at night, or on Sundays or holidays. Employ nursing mothers were to be allowed time for nursing their childre The administrative order specifically excluded from its app cation Jewish and other non-German women, for whom a min degree of protection was prescribed.

In the soviet union the employment of children 12 to 16 yea of age in families of collective farmers was required for at lea 50 full days a year by an order issued in April 1942. The e ployment of all children between 14 and 18 years of age farm work under the supervision of their teachers, who work with them, was also ordered as a part of a general mobilizati during the spring and summer vacations of 1942. The worki day of the children was to be limited to a period varying fro six to eight hours. Emphasis was placed in the child-care pr gram of 1942 on providing physical training for all scho children and proper institutional and foster-home care a recreation facilities for all war orphans and children of perso in the armed forces.

It is evident that the suffering of the war gravely affect children in continental Europe. Reports from Belgium, Franc Finland, Greece and Norway showed a greater incidence disease, and at least in some localities, of death among childre and even in neutral Switzerland infant mortality increased.

In an attempt to relieve at least partly the suffering amo children, a private welfare federation in Switzerland, under t direction of the Swiss Red Cross, was bringing groups of ch dren from France, Belgium and some Balkan countries Switzerland for a three-month vacation, usually in private home

In the United Kingdom and most of the countries of Europ including Czechoslovakia, Denmark, Finland, France, German Netherlands, Norway, certain Polish provinces and Swede attempts were being made, according to reports received by t League of Nations, in the spring of 1942 to offset food shortag by giving children priority in receiving milk and certain prote tive foods.

hile, a republic on the west coast of South America, extending some 2,800 mi. from just within the tropics to the
barctic south. Area, 289,776 sq.mi.; pop. (1940 census), 5,-
3,539; capital, Santiago; religion, Roman Catholic; president
942): Juan Antonio Ríos. The 11th national census of 1940
owed a population of 639,546 for Santiago, or 943,669 including
burbs. The 20 other principal cities (not including suburbs)
ere: Valparaiso (215,614); Concepción (92,364); Temuco (84,-
6); Viña del Mar (70,013); Osorno (62,106); Chillán (61,-
5); Talca (56,735); Los Angeles (52,259); Antofagasta (51,-
7); Valdivia (49,481); Puerto Montt (44,024); Talcahuano
1,536); Iquique (39,282); Rancagua (38,423); Linares (36,-
3); Curicó (35,270); La Serena (35,055); Nueva Imperial
3,361); Magallanes (Punta Arenas) (33,134); Cauquenes (33,-
6). An official estimate of May 31, 1942 gave Chile a popula-
on of 5,122,665.

History.—After the death of President Pedro Aguirre Cerda in
ov. 1941, Chile was temporarily ruled by an interim president,
erónimo Méndez. By a special election on Feb. 1 the voters
evated Juan Antonio Ríos, the representative of the Radical
arty, to the position of chief executive, and crushed his principal
pponent, ex-president Gen. Carlos Ibañez, who had returned
om exile only a year before. In April 1942 Ríos was inaugu-
ted.

Meanwhile, events had occurred which had made the confusion
rought by the interim rule even more pronounced. Although
uan Bautista Rossetti, the foreign minister of the Méndez ad-
inistration, had been instrumental in calling the Rio de Janeiro
onference of Foreign Ministers in Jan. 1942, his administration
ad not broken off its diplomatic relations with Germany, Italy
nd Japan as the Rio conference had recommended. Since it was
eported that Acting-President Méndez and his cabinet had chosen
policy of neutrality chiefly because the interim government
lt itself without sufficient powers to determine Chile's future
oreign policy, little was done concerning foreign relations until
he accession to power of Ríos. However, during the time be-
ween the end of the Rio conference and the inauguration of the
ew president, Chile tended to be drawn closer to Argentina, the only other Latin-American nation that had not broken its relations with the axis powers.

When the policy of neutrality (usually described as "non-belligerency") was not immediately changed by the accession to power of the newly-elected president, debates on foreign policy, already bitter, became more intense, with intraparty differences acting to bring political confusion. The Radical party, occupying the presidency and a majority of the cabinet posts, soon showed definite signs of splitting. The Socialists were particularly active throughout the year in a campaign against isolation. On June 4 Oscar Schnake, minister of development in the national cabinet (and one of three Socialists in that group), stated, before a crowd demonstrating for the United Nations, that Chile could not and would not remain neutral. Such words from a cabinet minister created a national sensation, and some of the more conservative journals demanded that Schnake be disciplined. In answer, Foreign Minister Ernesto Barros Jarpa pointed out that the minister of development spoke only for himself and not for his government. Amid such debates, the Chilean senate, after having heard a confidential report from Barros Jarpa, voted to leave the foreign policy unaltered at that time. However, demonstrations, both for and against neutrality, continued, and brought violence in many cases. In July a group which was reportedly led by communists invaded a Santiago meeting of the Committee for Peace and Neutrality (an allegedly fascist-sponsored group, composed principally of a membership drawn from the openly pro-fascist "Popular Socialist Vanguard" party), and the resulting clash of the two factions was broken up only by the police. Critics of the administration's policy increased their activities when it was announced in July that the government had ordered home, presumably because of a lack of success, the military officials sent earlier to Washington, D.C., on a purchasing mission.

When, in August, President Ríos accepted an invitation from President Roosevelt to visit the United States, it was conjectured that the Chilean executive was attempting to lead his nation toward a rupture with the axis, but was doing so in a gradual manner. In September, however, he declared that the purpose of his projected visit was to study the needs of hemisphere defense and that it involved no obligation affecting Chile's freedom to decide her own foreign policy. Those words, seemingly intended to quiet the fears of the isolationists, caused the opponents of neutrality, who had remained relatively quiet during August, to reopen their campaign against the administration. In September Socialist Oscar Schnake resigned his post as minister of development, and on Oct. 4 a Santiago newspaper openly charged that Chile was being used as a base of operations by a group of German spies.

The sensation caused by that declaration was, on Oct. 8, forgotten in the uproar resulting from the charges made against Chile by an official of the United States. Speaking in Boston, Mass., on that date, United States Under Secretary of State Sumner Welles had decried the use of two Latin-American nations (unnamed, but unmistakably Argentina and Chile) as bases for axis activities. Although President Ríos had been on the point of departure for his planned visit to the United States, he immediately cancelled the trip and instructed the Chilean ambassador in Washington to protest the Welles speech. Despite the attempt of pro-axis groups to fan the flames of resentment of the Chileans at a public rebuke by an official of a foreign government, some informed nationals asserted the justness of the charges. Substance was given to such views when the government, upon the reception of the evidence supporting the Welles' charges, began a campaign against alien spies. The foreign minister, who had come to represent, in the eyes of many, the principal spokesman for isolation, soon became the centre of attack for the opposition, and by mid-October attempts were made to force his resignation. Since he reportedly refused to leave unless the rest of the cabinet also resigned, on Oct. 20, after the opposition to Barros Jarpa had become more violent, the entire group of ministers asked to be allowed to retire. However, practically all the former ministers, with the exception of Barros Jarpa, were included in the new cabinet. Joaquín Fernández y Fernández, Chilean ambassador to Uruguay, was given the foreign ministry after Germán Riesco, a prominent liberal lawyer and a former minister of war, had refused the post. The new government struck with comparative boldness against the alien agitators. Three German spies, seized earlier but released on a technicality by a local magistrate, were interned on Quiriquina island, and on Oct. 30, Interior Minister Raúl Morales announced the existing laws against alien activities inadequate and prepared new legislation for submission to a special session of congress.

While the debates on foreign policy continued during the remainder of 1942, somewhat less bitterness was shown, and public attention was shifted to the spy hunt being conducted by the interior minister. Popular indignation against the United States, already ebbing after the publication of the evidence supporting the charges made by Welles, tended to subside even more as the year progressed, and on Nov. 5, an estimated 50,000 persons marched through Santiago to call for the end of relations with the axis. In addition, when the United States invaded French North Africa, 25 Chilean political leaders, representing almost all the parties, united in cabled praises to President Roosevelt. Improved relations with all the other American republics seemed close when Interior Minister Morales, on leave of absence from his official duties, appeared in Washington in December for a series of secret conferences.

Cereal crop failures in 1942, added to the already severely risen costs of living, forced the passage by congress in August of a bill giving emergency powers over financial and economic matters for a period of six months to President Ríos.

Education.—Primary education is free, non-sectarian and compulsory. Official reports for 1939 showed 3,522 government and 1,129 private schools with enrolments of 480,678 and 121,759 respectively; 86 public and 175 private secondary schools with 44,404 students; 151 special schools (including agricultural, vocational, industrial, commercial and normal), with 32,176. The National university, at Santiago, had 4,774 students, the Catholic university (Santiago), Santa María university (Valparaiso) and the University of Concepción together had 1,674. In 1942 16.5% of the national budget went for education.

Defense.—The Chilean army, regarded as one of South America's best, had about 1,500 officers, 20,000 regular troops, 15,000 one-year conscripts and a trained reserve of 200,000 men in 1941. The navy included one battleship (built in 1915), three cruisers, eight destroyers and nine submarines (the last being the oldest in active service anywhere in the world). The air force of several hundred planes was being augmented as rapidly as possible and the extraordinary defense appropriation of 4,000,000,000 pesos (approximately $135,000,000) by congress on Dec. 31, 1941 was, in good part, for that purpose.

Finance.—The monetary unit is the peso, valued at approximately 3⅓ cents U.S. The gold peso, used to report foreign trade, was valued at 20.61 cents in 1942. Government revenues for 1941 totalled 2,495,600,000 pesos, expenditures 2,760,700,000 pesos, leaving a deficit of 265,000,000 pesos to be added to the deficit of 120,000,000 pesos for 1940. The ordinary budget of 1942 authorized total expenditures of 2,630,900,000 pesos and estimated revenues at 2,441,900,000 pesos, leaving an indicated deficit of 189,000,000 pesos. To close the gap between revenues and expenditures congress, early in 1942, provided for higher taxes on incomes and a luxury tax of 10%.

Trade.—Imports in 1941 totalled 525,179,800 gold pesos (194 507,110,400 pesos), exports 781,504,400 gold pesos (1940: 69 727,900 pesos). The United States supplied 56.7% of all impo (1940: 47.9%; 1939: 31.1%), Great Britain 9% (1940: 10.4% Peru 9% (1940: 8.4%), Argentina 7.4% (1940: 6.7%). Asi from nitrate and iodine purchases (not reported by country destination, but aggregating 15% of all exports in 1941 and 20.2 in 1940), the United States took 64% (1940: 58.3%), Argenti 4.3% (1940: 2.7%), Great Britain 4.1% (1940: 5.8%), Bra 2% (1940: .05%). Mineral products made up 79.8% of all e ports (1940: 82.9%), agricultural 6.7% (1940: 6.3%), anim 5.1% (1940: 4.7%), manufactures, chiefly meats and sugar, 3.7 (1940: 3.2%). In 1940 copper alone accounted for 54.6% all exports, and in 1941 it was estimated that the percentage w somewhat higher. Precious metals aggregated 7.7% of the 19 total, but exports were decreased in 1941. The leading agric tural exports were beans, lentils and peas. Wool made up tw thirds of animal products exported, fresh and frozen meats a hides nearly one-sixth each. In the first five months of 1942 i ports of 236,300,000 pesos value represented a 26% increase ov the similar period in 1941.

Communication.—Under normal conditions, Chile has exte sive steamship connections with all parts of the world, includi direct service under the Chilean flag to New York city, to Guay quil, and to Argentina, Brazil and Uruguay by way of the Str of Magellan. Air transport service to all parts of America is pr vided by Pan American Airways and its affiliates, with sever flights weekly. Rail lines from Arica and Antofagasta conne with Bolivia. The former was eventually to form the Pacific e of a transcontinental railway to Santos (Brazil), on the Atlanti the latter line is linked directly with the main centres of Chil Rail-bus service to Argentina is maintained through the Tran andine railway route (closed to through rail traffic in 1934) a by way of Bariloche in the south. Approximately 150 mi. of t international line from Antofagasta to Salta (in northwestern A gentina, lying some 550 mi. from Antofagasta) had been co pleted on the Chilean side by the end of 1942, and constructi gangs were nearing the Argentine border.

Internal communication is by rail, coastwise shipping, air a highway. The state-owned railway system extends south to Puer Montt, with a narrow-gauge line on the island of Chiloé, and the north (in Tarapacá province) includes the Nitrate railw lines. Domestic aviation is well developed under the Nation Air lines, with routes from one end of the country to the oth The 23,000-mi. highway system includes nearly 10,000 mi. of i proved road; although still far from adequate, it is being rapid extended. During 1941 143,888,639 pesos were spent on constru tion and maintenance of roads and bridges. The Chilean mercha marine, owned, officered and manned by Chileans, is the best d veloped in Hispanic America.

Manufacturing.—Manufacturing has been confined almost e tirely to goods for domestic consumption, especially heavi goods, but provides only a minor part of domestic needs. In t first half of 1942 the index of manufacturing stood at 167.06 of the 1927–29 average, a decline of about 4% over a simil period of 1941. In 1940 the ten leading industries employe 22,093 persons.

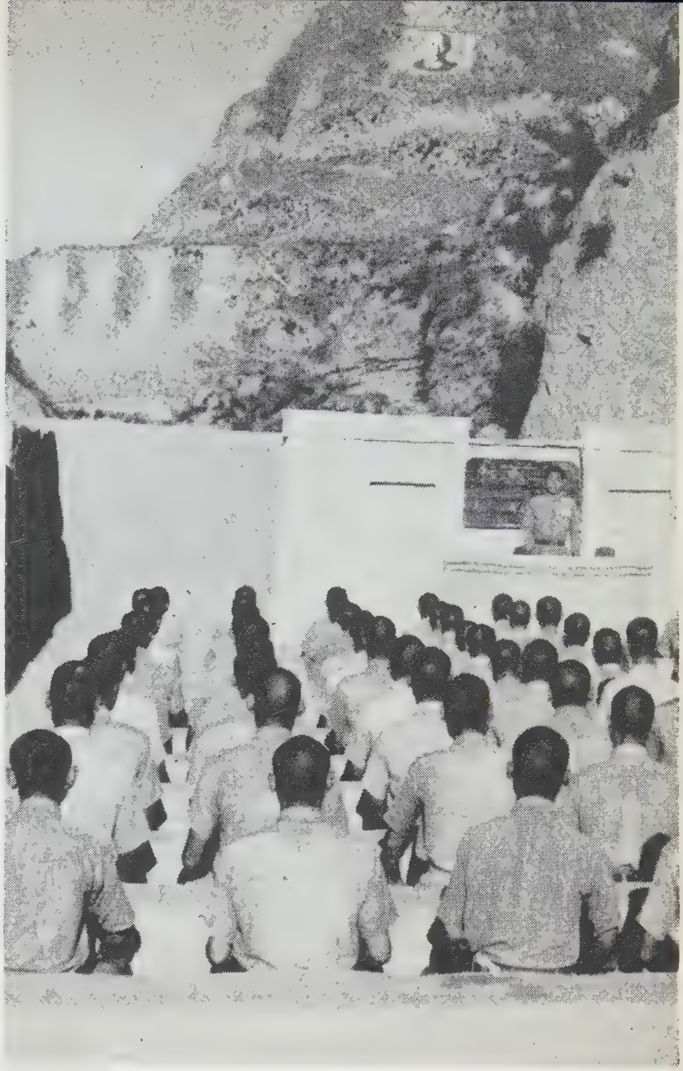
Mineral Production and Agriculture.—The mining indust produces the greater part of all export values, although the pr portion varies somewhat from year to year. Agriculture, ho ever, is the actual economic backbone of the country, in go part because the mines are mostly foreign-owned. Copper produ tion in 1941 rose to an all-time peak of 453,527 tons (194 352,010 tons); nitrates (1,428,379 tons in 1940), iron (1,748,4

ons in 1940), coal (1,937,438 tons in 1940), gold (10,663 kg. in
940) and silver (47,139 kg. in 1940) were produced at a lower
ate in 1941. Agricultural production (cereals, fruits, potatoes,
egetables and legumes) is of wide variety and is mainly con-
umed within the country. In 1942 wheat harvests were the
owest in nine years and the production of other cereals was even
ower, so that large quantities of Argentine grains were imported.
n agricultural and livestock census was begun in 1942, with the
ata to be used by the newly-formed Institute of Agricultural
conomy in formulating a definite farm program. (*See* also HIS-
ANIC AMERICA AND WORLD WAR II.) (C. N. G.)

hina, a republic of eastern Asia. Flag, a red background with
a blue sky and a white sun in the upper left corner.
rea, 4,480,992 sq.mi.; excluding Manchuria, Outer Mongolia
nd Tibet proper, 2,903,475 sq.mi. Total population, approxi-
nately 450,000,000. More than 10% of the area was under
apanese occupation in 1942, representing 30% of the most
opulated Chinese regions. Wartime capital, Chungking. Cities
vith populations of over 100,000 total about 100; after Pearl
Harbor Shanghai was reduced to less than 3,000,000; Nanking
nd Canton were reduced to less than 1,000,000 after the Japa-
ese occupation; Peiping and Tientsin each have more than
,000,000; other cities with a population exceeding 500,000:
Chungking, Changsha and Chengtu; cities over 200,000: Kun-
ning, Sian, Kweiyang, Foochow and Tsingtao. President: Lin
en; premier: Gen. Chiang Kai-shek.

History.—Immediately after Japan's attack on Pearl Harbor,
China, through Generalissimo Chiang, offered to stand with the
United States to defeat their common enemy and suggested the
stablishment of a unified command and the conclusion of a
ormal military alliance. On Dec. 23, 1941, an Allied Far Eastern
Military council was set up in Chungking. On Jan. 1, 1942, China
igned the Declaration of the United Nations as one of the four
ghting powers and on Jan. 6 a united information committee
f the ABCD powers was created in Chungking. However, the
tatements of Secretary Knox and First Lord of the Admiralty
Alexander early in 1942 that the Pacific war was a secondary
ssue caused China to suspect her allies' policy in the Pacific,
vhile Japan's peace bid after her success in the Pacific made
he Allies wonder about China's response. The situation was
larified by the official pronouncements of Senators Tom Con-
ally and Walter George and General Ho Ying-chin. The Anglo-
American new loans of $500,000,000 and £50,000,000 to China
n February, the appointment of Lieut. Gen. Joseph W. Stilwell
s chief of staff in the China theatre of war and commander of
he Chinese armies in Burma, China's decision to send a military
nission to the United States and the formation of a Pacific War
ouncil in Washington, D.C.—all in March—further strengthened
llied co-operation in the Pacific. On June 2 China was brought
nto the structure of Anglo-American lend-lease arrangements by
gning the Master Lend-Lease agreement.

Before Singapore and Rangoon fell, Gen. and Mme. Chiang
aid a state visit to India in an attempt to enlist India's full
upport to the Allied cause and to persuade England to grant
ndia real political power. After her success over the Indian ocean
nd south Asia, Japan started a spring offensive in order to
estroy the United Nations' air bases in China, to establish a
ontinental transportation system and to eliminate the rear and
anking threats that might come from China. China's position
ppeared serious. To assure China of U.S. determination to
rush Japan, President Roosevelt pledged on July 7 to fight
n to victory with China and to establish peace, justice and
reedom throughout the world while the U.S. army and navy
eclared their "firm determination to expel the aggression from every foot of Chinese soil." Wendell Willkie's visit to China in early October further aroused the enthusiasm of the Chinese in Allied war aims, as did the simultaneous announcement of the U.S. and British governments on October 10 of the relinquishment of extraterritoriality and related rights and privileges in China.



CHINESE SOLDIERS listening to a lecture by their commander on the Yellow River front in 1942

The military stalemate which began after the fall of Hankow continued in 1942. Of the thousand and more engagements, the important battles of 1942 were: the third crushing defeat of Japan at Changsha early in January, the battle in Burma and Yunnan from January to May, Japan's May offensive in Chekiang, Kiangsi, Kwangtung, Hunan, Honan and Shansi, Japan's withdrawal of troops from central and south China to the north, and China's successful counterattacks resulting in the recapture of most of the lost cities in Kiangsi and Chekiang in August. On Dec. 6 Japan began offensive operations in western Yunnan after she suffered another setback in the southwest Pacific.

Closer collaboration among soviet Russia, Great Britain and the United States in 1942 helped strengthen China's internal political unity. China's serious problem was economic, since inflation reached an acute stage in 1942.

Education.—The decision to place higher education under the direct control of the central government and the emphasis on the development of technical education marked two important features in 1942. New technical, professional and normal colleges were established and the total number of colleges and universities increased from 113 in 1941 to 129 in 1942, with an enrolment of more than 50,000.

Defense.—The General Mobilization act of May 1942 extended the age for military service from 18 to 40. The Chinese army had grown from about 200 divisions in 1937 to more than 300 divisions in 1942 with 5,000,000 in the field and 15,000,000 in reserve units and training camps.

Finance.—The daily military expenditure was estimated at 7,000,000 yuan. Revenues from direct taxes and government monopolies increased but covered only a very small portion of the expenditures. China depended largely on the following methods to finance the war: land taxes in kind, domestic and foreign loans, lend-lease aid and notes. The total internal loans floated from 1937 through 1942 amounted to 3,430,000,000 yuan, 100,000,000 customs gold units, £20,000,000 and $300,000,000; of these the $100,000,000 Allied Victory loan and the $100,000,000 Savings Certificates were issued in 1942. Up to Dec. 1942 China had received a total of $1,200,000,000 in foreign loans of which $700,000,000, extended by the United States and Great Britain in 1942, had not been used. The volume of note issue in 1942 was estimated at about 18,000,000,000 yuan—about three times the official figures of the note issue for 1940. A large portion of public outlays was financed through inflation. In July 1942 the official exchange rate of the Chinese national dollar was fixed at $5-1/16 and £3-1/64. This may not reflect the true exchange ratio.

There were 300 modern and native banks in Free China in 1942, not counting branches and agencies, as against 164 in prewar time.

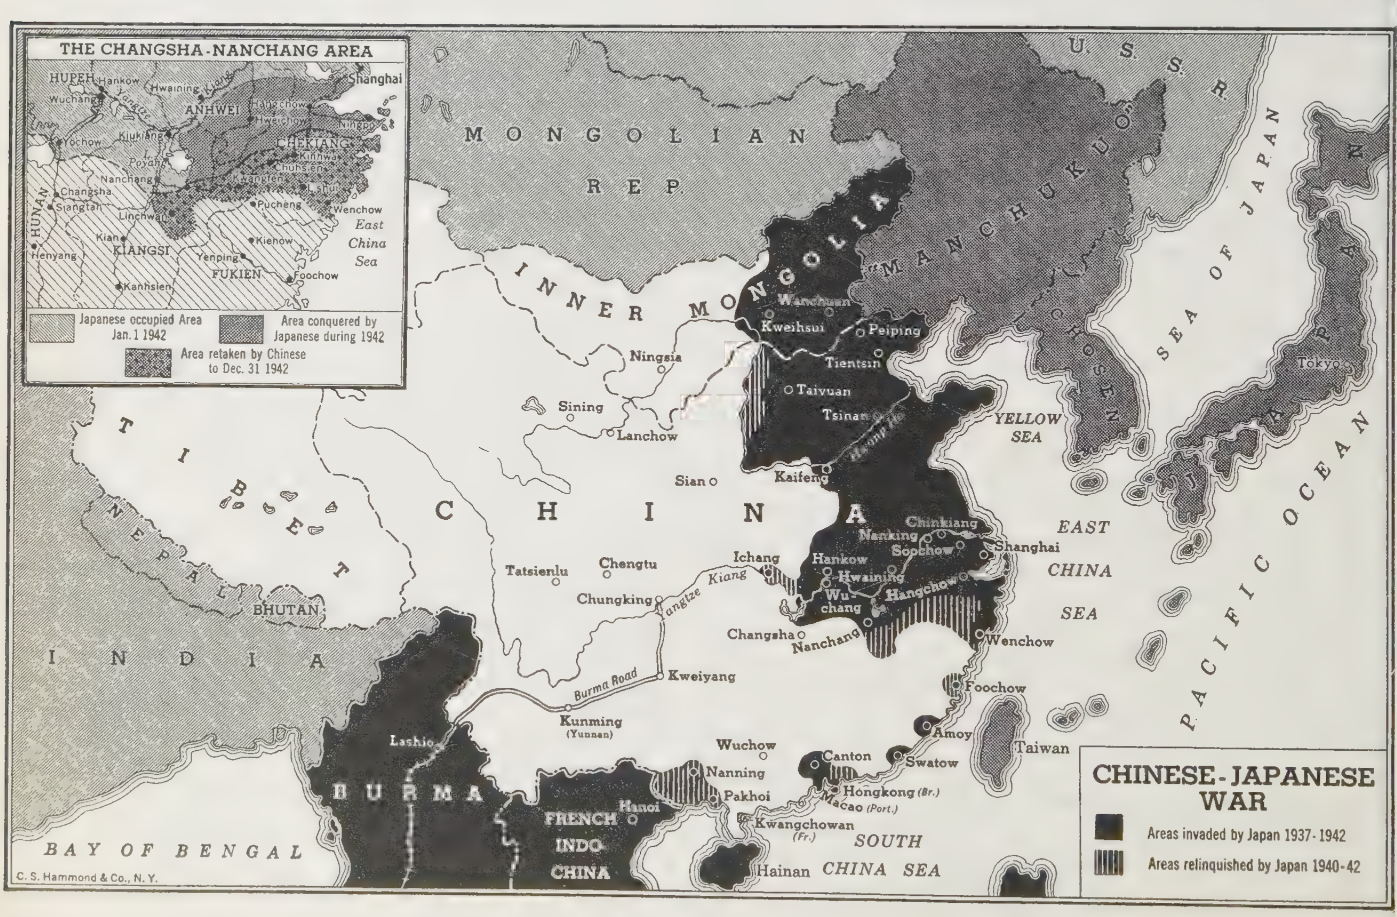
Trade and Communication.—The loss of Hongkong and Burma deprived China of her last important international outlets, and her foreign trade suffered a serious blow. India roads were surveyed and under construction but at the end of 1942 vital war materials were shipped by about two dozen U.S. transport planes.

Exports of tea, bristles, hides and raw silk moved on the Northwest highway to the border of Sinkiang, where it connects with the Turkistan-Siberian railway. From 1937 through 194 China had constructed over 10,000 km. of railroads and added about 10,000 km. of highways to the prewar mileage.

In order to utilize human labour as well as pack animals stage and river transportation was developed to assist the depleted modern transportation system. Over 47,000 km. of telegraph lines and 31,000 km. of telephone lines had been built since the start of the war. The Pacific war wireless contact between Chungking and the United States and Great Britain was efficiently maintained, and in Dec. 1942 a U.S.-China radio-photo communication was established.

Agriculture.—The average annual production of cereals in the 15 provinces in Free China is 1,500,000,000 piculs on 580,000,000 mou of land. The production of 1941 increased by 89,000,000 piculs and acreage increase by 45,000,000 mou (1 picul = 133⅓ lb.; 1 mou = 806.65 sq.yd.). It took about 60,000,000 piculs of rice and wheat to feed the army and public functionaries in 1942. In the first half of 1942 the ministry of agriculture and forestry registered the increase of 32,129,000 mou of cultivated land with a yield of 30,206,117 piculs of cereals.

Manufacturing and Mineral Production.—In 1942 there were 108 units of heavy industries under the direct control of the National Resources commission of the ministry of economic affairs and more than 1,350 privately owned modern industrial plants in Free China. In 1937 there were less than 380 private factories located in the interior. The value of total production in 1941 exceeded the estimated figure of 4,000,000 yuan for 1940. China's coal and iron reserves were estimated at 250,000,000,000 and 1,000,000,000 tons respectively. The production of minerals in Free China in 1941 was approximately as follows: coal 6,000,000 tons; iron ore 300,000 tons; copper 2,000 tons; tungsten 7,000 tons; tin 7,000 tons; antimony 7,600 tons; mercury 120 tons; crude oil 3,000,000 gal. China is extremely deficient in



THE FIFTH ANNIVERSARY of China's war with Japan, July 7, 1942, was observed with a military parade in Chungking

oil and steel and her trained engineers and technicians numbered about 10,000 and industrial workers about 200,000. To strengthen China's national defense and to raise the general standard of living of the people by industrialization, the National Resources commission prepared in 1942 a five-year industrialization plan for postwar China and a large training program was already under way. Chosen

(Korea). A part of the Japanese empire since 1910, Chosen is a peninsula extending southward from the northeastern side of the continent of Asia. It is bounded E. by the Sea of Japan, W. by the Yellow sea and N. by Manchuria and the maritime province of Siberia. Area, 85,206 sq.mi., including 1,018 islands; pop. (Dec. 31, 1938) 22,633,751, including 633,320 Japanese and 49,815 other foreigners, of whom about 1,000 were Europeans and Americans, the remainder being Chinese. The capital is Seoul (Keijo), population (1938), 737,214. Other cities: Fusan (213,744); Phyong-yang (Heijo) (234,726); Taikyû (172,040). Buddhism, Confucianism and Taoism are prevalent forms of religion. There were 494,500 Chosenese and 5,800 Japanese Christians in Chosen in 1938. Chosen is ruled by a Japanese governor-general. The governor-general in 1942 was Gen. Jiro Minami, who took office in 1936.

History.—Chosen was not a theatre of hostilities and there were no events of consequence in the country during 1942. A movement to obtain recognition of Chosen as an independent state was set on foot by some Chosenese resident in the United States; but no official decision on this question was announced.

Education.—Chosen in 1938 possessed 3,372 elementary schools, with 1,311,270 pupils. There were also 53 high schools, with 27,867 students, 57 girls' high schools, with 22,277 students, 226 technical schools, with 34,060 students, 10 normal schools, with 5,565 students, 18 special colleges (for medicine, dentistry, etc.), with 4,015 students and one university, at Seoul, with 558 students.

Defense.—Chosen has no national army, but the former rigorous ban on the enlistment of Chosenese in the Japanese army had been relaxed.

Finance.—The unit of currency is the Japanese yen (fixed at a nominal value of 23.48 cents U.S. for several years prior to the outbreak of war in the Pacific). The Chosenese budget for 1942–43 was balanced at a figure of 1,012,577,000 yen. The national debt, as of 1941, was 593,646,215 yen. The amount of currency in circulation in 1941 was 437,669,000 yen. The bank of note issue is the Bank of Chosen; and there are eight other banks in the country, with a paid-up capital, in 1940, of 84,431,000 yen.

Trade and Communication.—Chosen's imports in 1939 were 1,388,448,284 yen; exports were 1,006,793,785 yen. For nine months of 1940 (after which period figures were no longer published) imports were 1,176,120,813 yen; exports, 700,848,030 yen. Chosen in 1939 had 27,887 km. of roads, in 1940 had 4,293 km. of government railways, 1,815 km. of private railways. There were 738 steamships of a total of 106,712 tons and 1,125 sailing ships, of a total of 45,431 tons in Chosen in Dec. 1939. The length of telegraph and telephone lines in 1941 was respectively 8,863 km. and 11,115 km.

Agriculture, Manufacturing, Mineral Production.—Chosen is predominantly an agricultural country, with rice as the principal crop. The rice crop was 106,775,869 bu. in 1940. There were 1,705,000 cattle, 1,400,000 pigs, 51,000 horses and 20,000 sheep in Chosen in 1939. Principal other agricultural products are barley, millet, apples, rye and soybeans. Industries have developed, especially under the influence of Japan's forced military industrialization. The chemical industry in 1942 was the most important, followed by cotton and rayon, foodstuffs, cement, paper and pottery. Gold, iron, coal, wolfram and mica are important mineral resources. (W. H. Ch.)

Christian X (1870–), king of Denmark, K.G., of whom a biographical account will be found in *Encyclopædia Britannica,* nephew of Queen Alexandra of Great Britain, succeeded his father, Frederick VIII, in 1912. Despite protracted illness in 1942, King Christian still showed the nazi overlords the curt dignity of his independent spirit. During one of the repeated crises when the Germans were insisting on anti-Jewish laws in Denmark, the King and his entourage attended service in a synagogue. To Hitler's flowery birthday greetings on Sept. 26, 1942, the King's 72nd, he replied with only a blunt four-word telegram: "Thank you. Christian, Rex." Similarly precise, he rejected the German demand for the arming of Danish merchant vessels. On Oct. 19, 1942, he fell from his horse and was seriously injured; pneumonia set in, and not until Nov. 22 could he leave the hospital. (*See* also DENMARK.) (F. D. S.)

Christian Science. In 1942, the Wartime Activities of the Church of Christ, Scientist, or Christian Science denomination have been extended, particularly by the appointment of Christian Science Wartime Ministers. At present (January 1943), there are twelve Christian Science Chaplains, appointed, instructed, and paid by the United States Government, over one hundred Christian Science Wartime Ministers, employed, instructed, and paid by the Christian Science Mother Church, and about one hundred fifty Christian Science Wartime Workers, civilians who have volunteered for this service.

The Christian Science Wartime Ministers render a service to officers and men in the armed forces of the United States which could be rendered only by a Christian Scientist as a Chaplain or a Wartime Minister duly instructed for the practice of Christian Science. They conduct Christian Science services, respond to calls for Christian Science help or healing, provide Christian Science literature, arrange for Christian Science lectures, and are available twenty-four hours a day to help the servicemen who may wish to call on them, particularly those desiring Christian Science help or healing. The volunteer Christian Science Wartime Workers minister to the spiritual needs of Christian Scientists and others in the forces who turn to them for the friendly encouragement and practical help which these Workers are prepared to give.

Christian Science Wartime Activities are directed by The Christian Science Board of Directors and financed through The Mother Church's Wartime Fund, which is maintained by voluntary contributions.

Registered under the United States Neutrality Act, the Christian Science War Relief Committee, aided by numerous local committees and by four shipping depots, obtained and shipped to distribution committees in European countries, principally Great Britain, 9,811 cases, containing approximately 1,962,200 garments having an estimated value of $1,457,517. These figures represent shipments to December 1, 1942.

Early in 1942, the editors of *The Christian Science Monitor,* an international daily newspaper issued by The Christian Science Publishing Society, established a Peace Department and provided a Peace Aims Editor. The importance and prominence of the part played by this newspaper in international affairs was attested by the award of the Maria Moors Cabot Plaque, by the Trustees of Columbia University, for promoting understanding and friendship in the Western Hemisphere. This was the first time a North American newspaper received this recognition. (C. P. S.)

Christian Unity. Advanced action by agencies of organized interchurch co-operation was especially marked in the United States. The Federal Council of Churches and the Home Missions Council of North America adopted radical proposals looking toward the review of the church situation, community by community, throughout the nation for the purpose of eliminating duplications of organization by mutual agreement among denominations. In Canada the three major co-operative agencies of the churches united in the employment of a single general secretary with a view to the probable development of a Canadian Council of Churches. Eight major national interchurch agencies held joint sessions in Dec. 1942 and several of the more influential ones approved a plan for the merger of all eight in an inclusive North American Council of Churches. The most important group of war emergency agencies of the churches was earlier co-ordinated under a directing organization. Under the pressure of war emergency, the Lutheran Missouri synod, which had previously held aloof from joint action on account of its doctrinal position, agreed to co-operate "in externals" with other Lutheran churches.

In permanent co-operative organization the most important advance was the organization of the British Council of Churches, merging three already existing partial councils. Several South American and Caribbean countries established National Christian councils. The Federal Council of Churches of Christ in America gained additional strength by the adherence of the Church of the Brethren and the Ukrainian Orthodox Church.

Authorized conversations or formal negotiations between churches for organic union developed in a considerable number of cases. In the United States the Congregational Christian and Evangelical and Reformed Churches formally instituted conversations looking toward corporate union and set forth a preliminary plan. The official negotiators of the Protestant Episcopal and Presbyterian Church, U.S.A., issued a "Basic Elements plan" attempting to cover fundamental issues involved in the proposed organic union of the two bodies. Negotiations for reunion between the Presbyterian Churches U.S.A. and U.S. (Northern and Southern) continued hopefully, and the United Brethren and the Evangelical Churches announced the completion of a plan of union now to be submitted for formal action by the respective bodies. The United Lutheran and American Lutheran Churches agreed to "pulpit and altar fellowship," indicating the religious equality of the two bodies and laying grounds for intimate co-operation though not constituting corporate unity. Leading jurisdictions of the Orthodox Churches in North America also agreed to a plan of federation on the basis of their already existing identical doctrine and worship. In South India the plan of union, involving churches of Anglican, Congregational, Methodist and Presbyterian origins, was furthered by the withdrawal of objections to certain points of the United Church scheme. The North India plan of union (including a narrower range of churches) also made progress through mutual concessions and preliminary action. In South Africa the Presbyterian Church sent down to the presbyteries for consideration a plan of union with the Congregational churches.

The only cases of corporate union actually consummated during the year were those of the United Church of Christ in Japan, where bodies which had previously resisted union apparently were forced into it by governmental pressure; and of churches in central and north China, where a considerable group was also forced into union under Japanese insistence as part of the "New Order in Asia."

The war situation prevented the holding of a world assembly o consummate the organization of the World Council of Churches o which 77 bodies had voted adherence. Additional bodies so oting during 1942 were the Methodist Church of Brazil and the nglican Church of New Zealand. Active visitation by oecumenical eaders back and forth across the Atlantic continued throughout he year and the several international oecumenical study commisions issued various interim reports indicating substantial progress. he Report of the American Section of the Faith and Order ommission on Intercommunion indicated that many churches till found it impossible to allow free intercommunion in the ord's Supper in advance of further achievement of unity on other oints. (*See* also RELIGION.) (H. P. D.)

hromite. Although statistics for 1941 were not published for any important producer, it may be assumed hat wherever possible production was pushed to as high a level s possible. The normal supply to the United Nations was reduced y the loss of Greece, Yugoslavia and the Philippines, and shipnents were hampered from other sources of supply, especially urkey, India and New Caledonia. While the potential supply ost to the axis amounted to about one-quarter of the world output, the actual output which the axis might have been able to ecure was probably materially less, but there was no information n the conditions in which the mines were left when surrendered.

World Production of Chromite
(Metric tons)

	1929	1937	1938	1939	1940
Cuba	53,799	94,592	40,200	67,100	52,800

Production in the United States was negligible, up to 1941, and hough efforts were being made to foster the domestic output, it vas doubtful that the 1941 output amounted to more than about % of the consumption. The 1942 output was expected to be of he order of 65,000–70,000 tons, or possibly 8% of the demand; 1918 the domestic production was 44% of the supply, but it vas extremely doubtful if this proportion could be attained with demand that increased in a ratio of 6 to 1, but the tonnage was xpected to surpass the 82,400 tons produced in 1918. Large low rade deposits were being developed in Montana, California and regon, but progress was slow, and in the meantime demand was ncreasing at an unparalleled rate. Imports in 1940 were 657,689 ong tons, and in the first nine months of 1941 rose to 660,936 ons. Essential requirements for 1943 were expected to be about ,000,000 tons, of which not more than 3% would be allotted for ivilian use. (G. A. Ro.)

hronology: *see* CALENDAR OF EVENTS, 1942, PAGES 1–16.

hurchill, Winston Leonard Spencer (1874–), British statesnan, was born at Blenheim palace, Oxfordshire, England, on ov. 30, the elder son of Lord Randolph Churchill and Jennie, aughter of Leonard Jerome of New York city. For his biography nd his political career during World War I, see *Encyclopædia ritannica.*

The outbreak of war on Sept. 3, 1939, was the occasion for Churchill's re-entry into the cabinet in his old office of first lord of the admiralty. On May 10, 1940, when the German drive on France began, Chamberlain resigned and Churchill became prime minister. Churchill emerged as a fighting leader and on June 4, 1940, after the evacuation of Dunkirk, he promised that Britain would fight on alone "whatever the cost may be." During the years 1940–42, Churchill's public addresses and reports to parliament never attempted to disguise the gravity of Britain's danger. His conduct of relations with the U.S. was both diplomatic and straightforward. Equally frank were his statements regarding the U.S.S.R. and Japan. When Germany invaded Russia in June 1941, Churchill promised help to the Russians, yet he refused to modify his opposition to communism in its political sphere. Adamant toward Japanese plans for a "new order" in eastern Asia, he twice warned Tokyo in late 1941 that Great Britain would declare war immediately if Japan attacked the U.S. This promise he fulfilled Dec. 8. Two weeks later he visited President Roosevelt in Washington and on Dec. 26, he addressed a joint session of the U.S. congress, the first British prime minister in history to do so.

Although his government was rocked by the reverses in Burma and Malaya in the first months of 1942, he overwhelmed his critics with eloquence and parliamentary adroitness and on Jan. 29, 1942, won a 464–to–1 vote of confidence. After Singapore fell, however, he reorganized his cabinet (Feb. 22), dropping the ministers branded as "incompetents" by the opposition. On June 27, during his second trip to Washington, Churchill and Roosevelt jointly declared that the Allies would open military operations to divert nazi strength from the U.S.S.R. He conferred with Stalin in Moscow on these proposals in Aug. 1942. The U.S. landings in North Africa and the offensive in Egypt were the fruition of these plans. To critics who charged that Britain was merely in the war to preserve her empire, Churchill bluntly replied on Nov. 10, 1942, that "we mean to hold our own," and that he did not intend to "preside over the liquidation of the British empire." He warned the Italians, in a broadcast, Nov. 29, to sue for peace or suffer "prolonged and shattering air attacks."

Church Membership. The last *Yearbook of American Churches,* compiled under the auspices of the Federal Council of Churches of Christ in America, was published in 1941; and the next was expected to be issued in July 1943. In the absence of any official compilation in 1942, the figures on p. 186 were taken from the 1941 *Yearbook.* The "inclusive membership" column in this report gives the official records of the church bodies listed, based on their own reports. The "13 years or over" column is given for use in comparisons and discussions of the relative numerical standing of the churches reported.

These figures show that about one-half of the total population of the United States (over 49%), and approximately 60% of the population 13 years of age or over, were reported as church members. Of these, 97.4% were within the 52 religious bodies each having more than 50,000 members; the remaining 2.6% were in 198 smaller bodies.

Between 1930 and 1940 the population of the continental United States increased 7.2%; the officially reported church membership increased 7.86%. The 1936 Census of Religious Bodies was incomplete and unsatisfactory for some denominations, on account of the refusal of many ministers in these denominations to co-operate. The main differences were in the figures for the Southern Baptist Convention, the Methodist Episcopal and the Methodist Episcopal South, which reported only

Church Membership in the United States in 1940*

*Continental United States only.

43,618 churches to the 1936 census, while their own official statistics for the same year reported 65,267 churches. An analysis of the causes of this non-co-operation is found in the 1941 *Yearbook of American Churches* pp. 139–41. (*See* also CHRISTIAN UNITY.) (L. A. WE.)

Church of England.

The year 1942 was an encouraging one in ecclesiastical history. The King again called his peoples to prayer on March 29 and September 3. The first day was widely observed, and September 3 was marked by a wonderful response. The year saw further expansion of the war-time work of the Church and notably of the services rendered to the troops and to suffering civilians by the Church army. The Church continued to respond to the calls for more chaplains for the expanding armed forces. By Sept. 1942, the casualties among Church of England chaplains were 91 out of a total casualty list of 168 for all denominations. The figures were: killed, 11 (out of a total of 24); wounded, 16 (out of 20); prisoners, 64 (out of 124). The work of the chaplains was assisted by the appointment of women workers. The Church suffered further irreparable damage by enemy action, especially in the raids on Canterbury, York, Bath, Exeter (where there was a direct hit on the historic cathedral) and Norwich.

A more advanced Church education policy was planned during the year and there was a further growth of national interest in religious education. There were remarkable developments in Christian co-operation for this and other objects, including evangelism through "Religion and Life" weeks. A British Council of Churches was formed in September, and a Council of Christians and Jews was announced on October 1. Several steps were taken to develop the growing fellowship with the orthodox churches; and co-operation for large social and other aims between the Church of England, the Roman Catholic Church and the Free Churches was formally launched at a meeting in which the archbishop of Canterbury, the cardinal archbishop of Westminster and the Free Church leaders were associated. In January Dr. Cosmo Gordon Lang announced his resignation of the archbishopric of Canterbury, in order that the planning of the post-war Lambeth conference and the shaping of post-war policy and reconstruction might be in the hands of a younger man. He was succeeded by Dr. William Temple (*see* CANTERBURY, ARCHBISHOP OF), who in turn was succeeded as archbishop of York (*q.v.*) by the bishop of Winchester, Dr. C. F. Garbett.

WILLIAM TEMPLE was enthroned as 96th archbishop of Canterbury April 23, 1942

Among other events must be mentioned the presentation to the Church assembly of a scheme for reorganizing the parochial system in "ecclesiastical reorganization areas"; the interim report of the archbishops' commission on training for the ministry, presaging longer study and higher standards; the conclusion by the Ca edral commissioners of their reorganization of the cathedral stem; the growth and reorganization of youth work; and the pointment of Church assembly commissions to consider finan- al needs and episcopal incomes. The diocese of Oxford cele- ated its 4th centenary.

In the wider field of the Anglican communion as a whole, sym- thy went out to the sufferings and losses of the dioceses, mission ations and chaplaincies which were in enemy occupation, nether in the Far East (such as the dioceses of Rangoon and of ctoria, Hongkong) or in Europe. A centenary was celebrated June by the see of Gibraltar, which includes Malta as well as e Anglican chaplaincies in the Mediterranean area. A notable bilee was that of the medical missions of the Church Missionary ciety. Developments furthering the cause of Christian re-union cluded progress with the scheme for re-union in South India; d within the Anglican communion itself, new machinery was set to promote closer co-operation both at home and abroad be- een the Church of England and the American Episcopal nurch. (Ro. Sto.)

ivilian Conservation Corps.

The Civilian Conservation corps program, which d been functioning as an agency for the employment and aining of young men and the advancement of conservation pro- ams since April 5, 1933, was brought to a close in 1942. Over e years it had operated, the corps expended about $2,890,- 0,000; employed 3,500,000 persons; gave work and health aining to 2,750,000 young men and several hundred thousand ar veterans, Indians and territorials, and completed conserva- on work of an estimated current and future value of close to ,000,000,000.

The beginning of the war, which enormously increased employ- ent for everyone, including the unemployed young men who ormally would have been eligible for the CCC camps, brought out the closing of the CCC. On June 30, 1942, when corps rength dropped to about 60,000, congress voted to end the CCC d set aside $8,000,000 for liquidation purposes. On Dec. 15 uidation was about complete. All enrollees had been dis- arged, equipment valued at $125,000,000 had been or was in ocess of transfer to the war department, the navy department d the Civil Aeronautics administration, and most of the admin- rative organization had been transferred to other employment.

The materials made surplus by closing the CCC were eagerly ught because of their usefulness in the conduct of the war. rplus graders, tractors, trucks, bulldozers and other heavy uipment were sent to Alaska and used in the construction of e Alaska highway. Thousands of tractors, trucks and graders ent to the war department and were absorbed by the army. mps were used by the Maritime commission for school pur- ses. Scores of camps were assigned to Selective Service for using conscientious objectors. Many were transferred to other encies for use as quarantine centres for prostitutes. All but out 100 camps had been transferred by Dec. 15.

In its last year the corps devoted its energies primarily to train- young men for national service in the armed forces or in war production. Under this program, 200 camps were assigned to military areas where enrollees built roads, bridges, trails, telephone lines of communication, bombproof shelters for men and for planes, and developed a wide variety of training aids.

The corps planted about 3,000,000,000 trees, the bulk on unproductive lands. All told, about 3,000,000 ac. of devastated lands were brought into tree production. The corps worked on erosion control projects and on drainage ditch development, affecting more than 40,000,000 ac. It spent almost 7,000,000 man-days fighting forest fires, aided the wild life population by developing refuges, improved grazing conditions on the public domain, and advanced conservation generally by from 25 to 40 years. (*See* also Veterans Administration.) (J. J. McE.)

Civilian Defense.

Civilian defense in the United States during 1942 was concerned chiefly with the fulfillment of the four principal demands made upon it by the president's executive order which created the Office of Civilian Defense on May 20, 1941. These were:

1. To serve as the centre for the co-ordination of federal civilian defense activities involving relationships between the federal government and state and local governments.
2. To study and plan measures designed to afford adequate protection of life and property in the event of emergency.
3. To promote activities designed to sustain the national morale and to provide opportunities for constructive civilian participation in the defense program.
4. To maintain a clearinghouse of information on state and local defense activities in co-operation with appropriate federal departments and agencies.

Regional Offices of Civilian Defense, directly responsible to the United States Office, had been set up in the nine army corps areas before Dec. 7, 1941. State defense councils also had been established by this date, and, through them, numerous local defense councils, so that the president's first requirement had been met by the time of the attack on Pearl Harbor. Civilian defense had the skeletal organization needed to give direction and purpose to the actions of the thousands of volunteers who asked themselves on that historic Sunday, "How can I help?"

The prime necessity was clearly for "adequate protection of life and property in the event of an emergency," such as that which had struck at Pearl Harbor. Thousands of additional volunteers throughout the United States were enrolled for training as air-raid wardens, auxiliary police, auxiliary firemen, drivers, nurses' aides, and members of repair, rescue, and demolition units of the protective services already outlined by the United States OCD. The Office furnished local councils with complete programs of training for each of the 17 different units recommended for full protection against attack by enemy bombing. The biggest civilian protection news in 1942 was the appropriation by congress of $100,000,000 for use by the OCD. Most of this sum was being spent on fire-fighting equipment which the OCD distributed to local councils as fast as it came from the manufacturers. The cities marked by location or by the nation's war production chart as strategic areas were first on the priority list for this equipment, which included pumping units of 500-gallon permanent rating, pumping hose and other fire supplies, medical kits, and gas protective devices. With the distribution of nearly $60,000,000 worth of this equipment completed by the end of 1942, and with the training and drilling of over 5,500,000 volunteer workers in fire-fighting methods, the OCD's protective program was better than "under way."

Protection against sabotage was developed by the OCD in co-operation with owners and managers of plants and factories. The job of the Facility Security program, created by executive

AIR-RAID WARDEN demonstrating the uses of a water spray at the Civilian Defense institute of New York city in 1942

order on May 20, 1942, was defined to establish certain minimum standards of security for all plants engaged in vital war production and to see that such standards were observed.

The ordinary peacetime forces protecting U.S. forests from fires had an increased burden under wartime conditions in 1942, not only because timber was needed in war housing and production but also because of the added danger from fires started by sabotage. In accordance with the policy of the Facility Security program, the OCD, in co-operation with the departments of interior and agriculture, state forestry officials and private forest fire protective organizations, established a Forest Fire Fighters service. Trained volunteers, working in units of eight or ten members, safeguarded forest lands and other timber facilities and resources and minimized the effects of any fires that started.

Another very active branch of civilian defense in 1942 was the Civil Air Patrol. Volunteers in this work received no salary —only a per diem allowance for expenses while on active duty and a minimum hourly rental for their planes. Being civilians, they did not have to be within military age limits, so that it was not uncommon to find fliers and ground workers past 50 years of age. Although national in chain of command, the state Wings answered state and local defense requests. The patrol flew in blackout tests and mock air raids; took over disaster relief in flood or tornado areas; searched for lost aircraft; and acted as an aerial home guard. The CAP also went on active duty assignments for the armed forces. This work included the anti-submarine coastal patrol and extended courier-cargo service.

In addition to expanding and perfecting essential emergency protective services for the nation during the first months of 1942, the OCD also enlisted and trained a second great volunteer civilian army to engage in civilian war services. The chief job of these workers was to relieve the shock to U.S. cities of the inevitable dislocations in life caused by the swift change from peacetime to wartime production. Population in many cities and towns had doubled. Doctors and trained nurses by the thousands went into the armed forces until the average community had one-third fewer people in medical work than it had in 1941. Transportation problems were aggravated by the rubber shortage. Juvenile delinquency mounted in crowded areas where school facilities and child care centres were overtaxed or inadequate. The need to send good and sufficient food to the men in the U.S. fighting forces, to the lend-lease nations and to the starved people of the conquered countries, demanded a strictly enforced rationing of commodities. The draft created labour shortages in some agricultural and industrial areas.

The 5,500,000 workers enrolled in the Citizens' Service Corp of Civilian Defense met each problem as it arose in 1942. T protect families from being separated or broken up, and to assur workers of adequate living quarters, they made housing survey to find rooms and apartments for incoming war-labourers. The could not replace trained medical personnel, but they recruite volunteers for training as nurses' aides, made health surveys, an arranged mass immunization programs to protect their communities from disease and epidemic. They formed share-a-ca clubs to save rubber. They took training in child care and established centres for care of children whose mothers were the left free to take jobs in war industry. They served on rationin boards, at recreation centres and in nutrition classes, and the recruited labour for agriculture and industry.

These workers were co-operating with—not duplicating th work of—representatives of other government agencies. Th volunteer office of each local defense council supplied the manpower for the war job that the community had to do, whethe the job was under the direction of the Office of Defense Transportation, the Bureau of Industrial Conservation, or the loc council itself. When the task demanded trained personnel, th customary practice was for the local volunteer office to suppl the raw recruits and the agency requesting the volunteers t give the training needed.

In many communities, local kindergartens or child care centre asked the volunteer office for workers whom the children's agenc trained for the special work. Local hospitals usually trained th nurses' aides, public health officials the volunteers in speci services for public health, and so on. The volunteer office was reservoir of woman and manpower upon which all other government agencies could draw.

Before the truly vital programs of rubber conservation, scra collection, and the rationing of numerous commodities could b effective enough to count in winning the war, they had to hav the enthusiastic support of every family in the nation. The OC did much during 1942 to achieve this goal, having organize civilian defense by region, state, and local community, until som 11,000,000 volunteers were enrolled in 11,000 local counci throughout the country by the end of the year.

In Chicago, where the block plan—designed to reach eve citizen for effective war work—went into operation, 1,000,00 persons were enrolled for civilian services in 1942. In every o of the city's 1,500 blocks, leaders chosen from all occupations an walks of life—retired army officers, college athletes, police captains, businessmen—were obtaining splendid co-operation fro their neighbours. Nine specific civilian war activities, includin salvage, conservation, nutrition and defense savings, were unde way in each block.

Almost everything that civilians could do to help win the wa was carried out through the block plan. Surveys by block leade determined the number of spare rooms available for incomin war workers, the number of children needing day care, and th number of children, mothers, old and sick who would have to b taken care of in case of emergency.

The block leaders also made surveys to find out the numbe of women available for training and placement in war industrie or the number of people available for emergency farm labou and the number able to join in share-a-car plans, when counc committees asked for this information.

In Syracuse, N.Y., within a single week, leaders devoted som 18,386 hours to interviewing 27,500 families. This amount of tim would require a force of 2,398 workmen, each putting in a eight-hour day. If paid for at the rate of 50 cents an hou it would involve a labour cost of $9,193. As a matter of fac these 18,000 hours of volunteer labour cost the defense counc

Syracuse only $28.50—the total cost of mimeographed mate-l, record cards, and miscellaneous other expenditure.

The local defense council through the block plan, reached ery possible source of manpower—women, Negroes, young ople, old people—to do these war jobs. The council was the servoir of human energy upon which the government could call carry out any task which could help speed victory. It was not ly a defensive force; it was the greatest civilian offensive army er organized in U.S. history. (*See* also MUNICIPAL GOVERN-ENT; MUNITIONS OF WAR.) (J. M. Ls.)

Great Britain.—The year 1942 was, on the whole, marked by duced activity so far as the luftwaffe was concerned, though it s notable for the so-called "Baedeker" raids; and for a con-derable amount of daylight raids of the "tip and run" variety.

The main feature of the "Baedeker" raids was a concentration attack on targets having a high fire risk and included towns therto regarded as non-target areas. The Germans also modified eir fire bomb tactics and the type of bombs used, all with the ject of trying to overwhelm the fire guard organization and ake its work more dangerous.

The raids provided valuable lessons and showed how the tactics civil defense needed constant modification to meet and, if ssible, to anticipate the moves of the enemy.

The main developments during the year, therefore, were de-gned to meet the more concentrated types of attack, and one the most important was the setting up of regional mobile lumns. These columns, which were located tactically with regard probable target areas, consisted of a number of whole-time rsonnel, highly trained in rescue, first aid and decontamination, d complete with their own transport and equipment. They were ployed by regional headquarters as required. The personnel re either found from local authorities on a rotational basis, or re permanently stationed at the columns. In the former case ey spent a month at the column at a time. This procedure abled a high standard of training and efficiency to be reached. some columns regional schools in rescue, first aid, etc. were so located.

The fire guard organization was expanded, and included the mpulsory enrolment of women. The training was also greatly eveloped, especially the tactics of fire fighting and the im-rtance of combined action by teams in preventive tactics as ll as actual fire fighting.

A civil defense staff college was started at the beginning of e year and proved very successful. The object of the college as to improve the whole standard of staff work in civil defense d to encourage thought. The courses were open to all those hold-g responsible positions in civil defense, including industrial ncerns and public utility undertakings (*e.g.*, water, gas, elec-icity, railways, etc.); and special courses were arranged to ster close liaison with the military authorities and the home ard.

Women were being used increasingly in civil defense, includ-g the decontamination services, and were proving of the greatest lue. One interesting development which advanced greatly during e year was the housewives' service, for which the Women's oluntary service was mainly responsible. The ultimate object as to have a house or houses earmarked in almost every street th some simple first-aid equipment, and the housewives trained elementary first aid; and to have houses where personal eansing could be carried out in case gas should be used. This heme covered other tasks, such as cooking, etc. and in times heavy bombing or invasion this mutual help service would ove—and indeed did prove—of great value.

The after-raid services were further developed and where ecessary expanded, especially in country districts and areas surrounding possible target towns.

The year showed a steady tightening up of the organization with intensive training and exercises, all with a view to meeting any forms of attack. The benefits of the reorganization of the fire services on a national basis were more than apparent in the raids that were experienced. (*See* also AIR RAID DEFENSE; GREAT BRITAIN.) (E. J. H.)

Civil Liberties.

In 1942 the United States, during its first year of war, pursued without hysteria its historic pattern of expanding civil liberties. The supreme court upheld the right of indigents to migrate from state to state, enunciated the employer's rights of free speech under the National Labor Relations act, voided a Georgia peonage statute and reversed convictions for contempt of court in the *Los Angeles Times* case, thus enlarging the area of criticism.

President Roosevelt, as president and as commander-in-chief of the army, promulgated directives expanding the rights of minorities with reference to the employment of aliens and discriminations on racial grounds in defense industries.

Military censorship was established, and although it took some time to pin-prick the frontiers of military necessities as to news, criticism of the operation of such censorship rested on the shoulders of publishers who evidenced little courage in standing up for the rights of a free press.

Attorney General Biddle enunciated a humane pattern for the treatment of enemy aliens and the handling of the problems of conscientious objectors. A paradoxical position was taken as to removal of Japanese citizens from war zones but this wholesale removal was preferred to the difficulties of individual testings as to loyalty. An inter-departmental board to review discharges of federal employees on grounds of subversive beliefs was established.

The department of justice commenced proceedings against the Associated Press, and the Federal Communications commission was successful before the statutory court in breaking through some of the alleged bottlenecks of the dominant network broadcasting companies. This case was on appeal to the supreme court. Democracy showed its inner security in permitting irritating practices of minority groups, such as Jehovah's Witnesses, despite the fact that large portions of the community objected to such practices.

The motion picture industry continued submission to pressure groups and state boards of censorship, but John Steinbeck successfully contested eliminations by the New York censors from his film *Forgotten Village*. Noel Coward's picture *In Which We Serve* was cut by the Hays censorship office despite England's acceptance of the picture uncut.

The post office department for the first time in its history granted hearings before the banning of newspapers from second-class postal privileges, and the consent of Father Coughlin for the withdrawal of *Social Justice* was carried out in orderly administrative fashion.

In the city of New York, Mayor La Guardia urged the police to use the third degree, took magazines off the newsstands without any legal process, closed various theatrical productions, particularly burlesque, and carried on a course of practices in violation of civil liberties.

Civil rights in connection with labour and trade union activities occasioned no great controversies since an overwhelming proportion of labour relinquished the right to strike during the war. Moreover, the American communist movement, a disturbing element *vis-à-vis* civil liberties, with picket lines at the White House against preparedness, made a complete about-face, when Germany attacked Russia, thus reducing substantially the areas of disturbance.

A decision in Connecticut's highest court declared it illegal for a doctor to prescribe contraceptives even to save the life of his patient. This case was on review in the United States supreme court. (*See* also LAW.) (M. L. E.)

Civil Service. Throughout 1942 the U.S. civil service scene was completely dominated by the conditions and requirements of war. There was a drastic streamlining of policy and procedure in many directions, leading to a very substantial modification of well-established procedures, especially by the U.S. Civil Service commission. Shortages of manpower developed in many areas. In the face of the preoccupations of war, many normal trends were interrupted; for example, Virginia was the only additional state to adopt a state-wide merit system statute.

The scope of government employment increased to a new high during 1942. On June 30, 1941, federal employment was somewhat under 1,500,000. By June 30, 1942, total employment in the executive branch of the federal government had risen to about 2,200,000, and by the end of the calendar year it stood at more than 2,600,000. As in 1941, a considerable proportion of this expansion occurred in the war department, in the navy department, and in those agencies concerned with war activities, for example, the office of price administration. At the end of the year the house of representatives authorized an investigation of the federal service by the Civil Service committee, partly to inquire into the question whether some of the federal agencies had not expanded beyond their actual needs.

Employment in state and local governments continued to remain relatively stable. An inquiry about losses of key personnel in a sample of 6 states, 5 counties, and 11 cities for the six-month period from Jan. 1, 1942, to June 30, 1942, showed that 2,550 key employees had been separated in this interval from a total of 51,000 positions. The separations took place in the following proportions: 1,600 to the military service, 375 to war industry, 125 to federal positions, and 450 others.

During the year, government competed with industry and with the armed forces in a constantly tighter labour market. The needs of the armed services had undisputed priority, as signalized in Nov. 1942 by the order of President Roosevelt terminating all military deferments for federal civilian employees except in cases specifically authorized by him. The rate of turnover in the federal departments was extremely great, and the departments were forced to take advantage of every possible device to make the best use of the personnel available.

An early response by the U.S. Civil Service commission in areas where shortages of personnel appeared was to hold open continuous examinations, as a result of which a person possessing minimum qualifications was examined forthwith and immediately certified for employment. This plan was supplemented in many instances by the abandonment of the normal competitive procedures and by the elimination of much paper work incident to selection and appointment under ordinary circumstances.

Another change in procedure developed in expanding control by the commission over transfers from one agency to another. At the outset there was a tendency to follow the pattern of World War I by making transfers difficult in order to prevent one government agency from "pirating" superior employees of another. This restrictive position quickly became intolerable, and the opposite policy was introduced of facilitating transfers under the general direction of the commission. Subsequently the power of the commission was increased by authorizing it to direct the transfer of a specific employee from one agency to another, even without the approval of the agency in which the employee had been employed. A further significant aspect of civil service development was the establishment of a special section of the examining division to handle the whole field of administration and top management.

Subsequent to March 15, 1942, all appointments in the executive branch of the federal government became war service appointments, terminating six months after the end of the war.

A significant aspect of the trend of decentralizing Washington agencies in 1942 was the formation in November of the first regional personnel office in Chicago, a field counterpart of the Council of Personnel Administration in Washington. The balance between headquarters and the field establishment seemed definitely to be in process of reconstruction.

During the year three states held nation-wide examinations for the position of state personnel director, Wisconsin ($5,000), Connecticut ($7,500), Pennsylvania ($7,000–$9,000). (L. D. W.)

Clark, Mark Wayne (1896–), U.S. army officer, was born May 1 at Madison Barracks, N.Y., where his father, Col. Charles C. Clark, was then stationed. A graduate of West Point in 1917, he saw service on the Western Front in World War I and was wounded in June 1918. After the war, he was stationed with the army of occupation at Coblenz. He was graduated from the Command and General Staff school, 1935, and the Army War college, 1937. In Aug. 1942, he arrived in England to take over command of U.S. ground forces in the European theatre of operations, and in Nov. 1942, he was second in command of the U.S. forces that landed in North Africa. Three weeks before the invasion, General Clark and a group of U.S. officers were secretly landed on a coastal point in French North Africa. They established contact with French officers eager to co-operate with the United States and secured an agreement from these officers not to resist the American landings. He was awarded the Distinguished Service Medal and the Congressional Medal of Honor and promoted to a lieutenant general for this mission. He also headed negotiations with Adm. Jean Darlan for the cessation of all hostilities in Morocco and Algiers.

Clays. There was an increase of 31% in sales of kaolin in the United States in 1941, to 1,087,848 short tons, of which the paper industry used 56%. Although paper was the largest consumer, other types of use showed relatively greater increases in the amounts used. Ball clay sales rose 41% to 198,445 tons, of which 92% went into pottery and tile. Imports of both types of clay declined, since England was the chief source. No information was available on other types of clay. Also, it was to be noted that the greater portion of clay used in industry was used directly by the producer, and not sold, so would not be covered by the figures reported. (G. A. Ro.)

Cleveland. Sixth largest city of the United States, Cleveland, O., had a population of 878,336 by the federal census of 1940. Area, 73.74 sq.mi. Mayor (Jan. 1, 1943): Frank J. Lausche. Cuyahoga county, which includes Cleveland and its major suburbs, had a population (1940) of 1,217,250, which the census bureau estimated had risen to 1,231,000 as of May 1, 1942.

After years of discussion, Cleveland in 1942 closed the deal to buy the Cleveland Railway Co. which operated street car and bus lines on the city's streets under a franchise. City council authorized sale of a $17,500,000 traction bond issue to an investment syndicate April 9, and the transfer was completed April 28. Stockholders were paid $45 a share. Passage at the November election of a municipal charter amendment placed control of the city transit system under a three-man board.

Mayor Lausche completed his cabinet by appointing Frank D elebrezze director of public properties and Dr. Charles T. olezal welfare director. When Eliot Ness resigned as safety irector April 30, he was succeeded by Celebrezze, and Councilan William C. Reed was appointed director of public properties. ouncilman Emil J. Crown was named public utilities director.

Financial problems plagued the city administration. Funds eeded for civilian defense prompted Mayor Lausche to ask in 942 for the largest city budget in years—$16,619,925. Budgetary eeds were increased when the city council voted, over the ayor's veto, to increase salaries in the police and fire divisions the extent of $500,000 a year. The problems multiplied as the oters rejected proposed bond issues of $4,000,000 for bridge epairs and $1,000,000 for modernization of the city hospital the August primary election and a proposed 1.7 mills operating evy at the November election. After the proposed operating levy ad been reduced to 1.3 mills and resubmitted at a special election ec. 22, only to be defeated again, Mayor Lausche planned etrenchments.

The board of education in Dec. 1942 voted to increase the pay f 5,200 employees, including teachers and principals, from 2% to 5%. Lee C. Howley, assistant United States district attorney, as appointed to the board of education to replace Charles A. anik, who resigned to take a navy commission.

Bishop Edward F. Hoban, head of the Catholic diocese of ockford, Ill., was appointed coadjutor to Archbishop Joseph chrembs of the Cleveland Catholic diocese, who had been in health.

A new record for handling iron ore was set by the port of leveland in 1942. More than 14,650,000 gross tons of ore were nloaded before ice halted Great Lakes shipping. That amount xceeded the ore receipts of any other port in the world. Grain hipments received totalled 2,221,690 bu. Shipbuilding was purred by war demands, and the ore carrier "Belle Isle," rgest ship ever built in Cleveland, was launched Nov. 15. Shipards also were building minesweepers and other auxiliary craft or the navy. Industrial plant expansion continued, 521 Cleveland ompanies spending $151,543,830 for that purpose in 1942. An eroplane assembly plant costing in excess of $5,000,000 was nder construction and the $18,000,000 federal aircraft engine boratory at Cleveland airport began operating May 8.

More than 51,000 men had entered the armed services from uyahoga county by the end of 1942. Figures released by the hio headquarters of the Selective Service system showed that 2,814 men had enlisted up to Oct. 1 and 38,287 had been inucted up to Nov. 1. (P. By.)

limate: *see* METEOROLOGY.

lothing Industry.

War, conservation, shortages and priorities dominated the clothing industry in 942. Based on the quartermaster theory of one garment to wear, ne in transit and one in stock, huge numbers of military garhents of every description were contracted for; by rapid converon and in the face of rigid specifications the industry met the equirements of the armed forces' unprecedented demands.

Conservation measures promulgated by the War Production oard (WPB) eliminated many style features on civilian clothing. uffs, pleats, high rises, wide trouser legs, patch pockets, pocket aps, vests with double-breasted coats, long coats and wide sweeps ere forbidden on woollen clothing. Regulations were issued afecting pajamas, shirts and other cotton clothing. The zoot suit as eliminated.

Military demands resulted in the scarcity of many items used in ivilian manufacturing. Combed cotton fabrics, woollen fabrics, will tapes, quality thread, metal trimmings, unbleached pocketing, canvas, etc., became difficult to secure without priorities.

Machinery was quickly put under the priority system by the WPB. At the end of the year with the introduction of the controlled materials plan (CMP), machinery became extremely difficult to procure. Clothing machinery manufacturers converted to direct war work.

The rubber shortage affected raincoats; even military rainwear used synthetics. Consequently civilians turned to water-repellent cotton rainwear.

Military garment innovations were: (1) windproof lightweight fabrics for arctic wear, (2) alpaca pile fabric linings for aeronautical garments, (3) electrically-heated flying suits. The outstanding fact about military garments was that they were primarily special purpose utility clothes—designed and produced to facilitate a particular type of action on the part of the wearer.

At the close of 1942 woollen stocks were high, clothes rationing was hinted at and the civilian consumer was prepared for blended fabrics. The American soldier and sailor would however continue to be the "best dressed in the world."

It was estimated that at the end of 1942 not less than 60% (3,000) of the manufacturers in the entire industry, with a potential of 85% of the unit garment production of the United States, were engaged in varying degree on military or industrial garments and equipage.

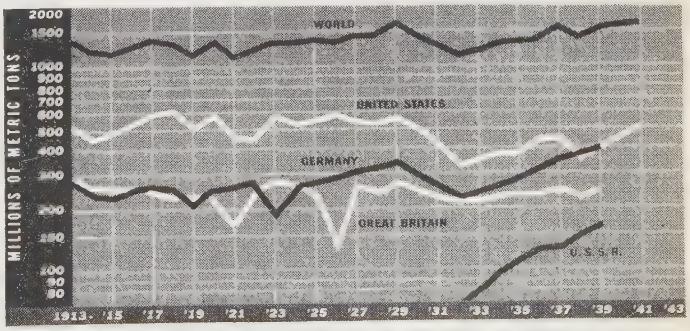
In the first ten months of 1942 total cuttings of men's, youths' and boys' woollen and woollen blend clothing (coats, suits and separate pants) equalled approximately 43,000,000 units; these factories cut and made approximately 15,000,000 military garments (coats, overcoats and pants). During the same period total cuttings in the men's and boys' garment (cotton, leather and allied garments) industry were: overalls and industrials 7,165,000 doz.; work and semidress pants, slacks and shirts 8,106,000 doz.; leather, heavy, oiled, shirt, pajama, wash and miscellaneous garments 23,520,000 doz.; military garments (coats, overcoats and pants) 30,035,000 units; other garments under government contract 4,171,000 doz.

British manufacturers featured "austerity" clothes in 1942 and further cuts in civilian clothing rations were made; as in the United States style was subordinate to conservation. (H. Sn.)

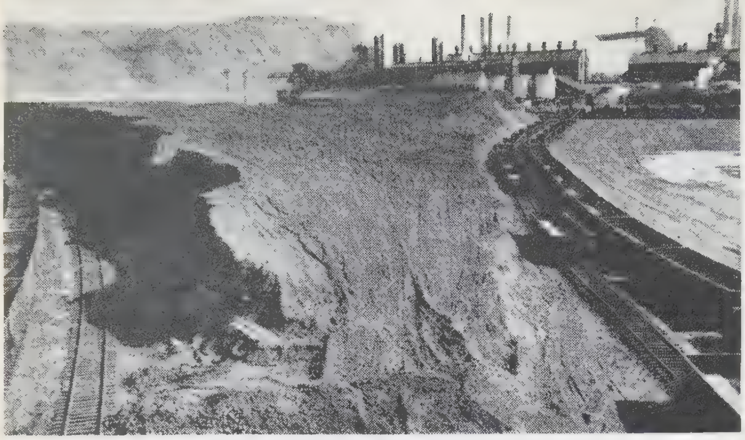
Cloves: *see* SPICES.

Coal.

World Production.—With the distribution of production data held up by war censorship, it was difficult to estimate the total for world coal production after 1939, when it amounted to 1,466,000,000 metric tons. The intense industrial activity required by the war effort greatly increased production in the United States, and possibly to some extent in Great Britain and Germany, the other two largest producers. In other countries there were increases or decreases, as local conditions dictated. To just what extent these changes were offsetting was not known,



COAL PRODUCTION OF THE WORLD and the major producing countries, as compiled by *The Mineral Industry*



COAL RESERVE PILE around steel plants in Pennsylvania. The steel mills consumed record quantities of coal in 1942

but it was estimated that the total output for 1941 was in excess of 1,600,000,000 tons.

Minor Producers.—The three countries mentioned above account for two-thirds or more of the total output, and a large number of minor producers for the remaining third. None of these had an output in 1942 sufficient in size to be of any magnitude in comparison with the world total, but in many cases the limited output was of strategic importance, in that it might add to the resources of the enemy, or might relieve a major producer of the necessity to maintain a supply by export at a time when the fuel might be needed at home, and transportation was difficult.

In Canada the total coal production for 1941 was 18,222,107 short tons, an increase of 4% over 1940, but consumption was 39,499,519 tons, with the remainder supplied from imports. Production during the first 10 months of 1942 was 6% better than the same period of 1941, with a total of 15,485,837 tons, while consumption for this period increased 15% to 36,228,530 tons.

Other western hemisphere outputs in 1941 were 852,000 metric tons in Mexico, 1,404,000 tons in Brazil and 2,040,000 tons in Chile. Consumption in this large area must be supplied by imports, except for these limited outputs.

In Europe Spain had the only continental coal production west of U.S.S.R. that was not directly under axis control, so that the 9,588,000 tons turned out in 1941 had an importance out of proportion to its magnitude. Turkey was another strategic area, with a 1941 output of 3,020,000 tons. Netherlands East Indies, with an output of 1,591,000 tons in 1941, came under Japanese control. No recent figures were received from China, but indications pointed to an increase in output, while in Australia an output estimated at 9,500,000 tons in 1941 was being increased, with hopes of reaching 12,000,000 tons.

Major Producers.—No statistics were published by any of the major producers but the United States, but some inferences could be drawn from prevailing conditions. It seemed likely that Germany had been able to maintain a fairly adequate supply of coal for internal industrial use, and it was presumed also for domestic use, since it had been openly proclaimed that whoever might be cold in Europe, it would not be the Germans. Even if civilian needs in German allied and occupied countries were entirely disregarded, the industrial supply needed in these countries to sustain the aid which Germany demanded from them most certainly suffered to a considerable degree. France and Italy had been both large importers of fuel, from sources no longer available.

United States.—The total coal production of the United States in 1941 was 567,658,300 short tons, including 511,290,000 tons of bituminous and 56,368,300 tons of anthracite, all increases of approximately 11% over 1940. Work proceeded steadily throughout the year except for the usual vacation periods and a six-weeks' shutdown in April and May while a new bituminous contract was being negotiated, but these delays were sufficient to cut production 10% or more below the level that might otherwise have bee reached. The 1941 bituminous consumption was estimated 480,000,000 tons, up 12% from 1940, while stocks advanced fro 50,958,000 tons on Jan. 1 to 62,737,000 tons on Dec. 31.

Production continued to improve in 1942, the bituminous ou put to the end of November being 525,550,000 tons and anthraci 55,127,000 tons, a total of 580,677,000 tons, while the total f the year was estimated at 632,000,000 tons, an increase of 12 over 1941. Bituminous production was consistently well abo 11,000,000 tons weekly, except for the usual holiday perio and the vacation period in July. The best daily loading w 37,272 cars on May 29, and the best week was 11,620,000 to in the week ending Oct. 31. Consumption through October i creased 11% over the same period of 1941, to a total of 442,908 000 tons, including 354,198,000 tons for industrial use, 85,920,0 tons in retail sales and 2,790,000 tons used as mine fuel. T year-end stocks declined somewhat in January and February, b increased during the remainder of the year, to 89,922,000 to at the end of October, the supply on hand at that time bei equivalent to average consumption for 62 days, against stoc of 40 days at the beginning of the year. As with bituminou anthracite production was well maintained; although the produ tion curve as a whole was somewhat more irregular, the on prominent drops were at the holiday periods, and some of the were markedly less than usual.

Table I.—Coal Production of the World
(Millions of metric tons—all grades)

	1929	1932	1937	1938	1939
Canada	15.87	10.65	14.37	12.97	14.08
United States	552.31	326.19	447.58	358.01	403.28
Belgium	26.93	21.42	29.86	29.58	29.85
Czechoslovakia	29.08	26.82	34.67	26.60	?
France	68.49	57.70	45.33	47.56	51.00
Germany	348.61	227.39	372.70	384.92	430.00
Netherlands	11.74	12.88	14.46	13.66	13.06
Poland	46.31	28.87	36.24	38.11	?
United Kingdom	262.05	212.08	244.27	230.66	236.70
U.S.S.R.	38.42	53.60	127.00	132.89	?
China	?	28.00	?	?	?
India	22.50	20.48	26.09	29.52	28.21
Japan	36.14	28.22	?	?	?
South Africa	13.02	9.92	15.49	16.28	16.89
Australasia	14.88	13.21	18.03	17.87	19.83
Total	1,559.00	1,124.00	1,550.00	1,469.00	1,466.00?

While the estimated total of 632,000,000 tons for 1942 w numerically 7% less than the record high of 1918, in making th comparison it must be remembered that coal demand had unde gone a radical change in that time. In 1918 the fuel equivalent the petroleum production was comparatively small, being less th that of the anthracite production alone, but in 1942 the co equivalent of the petroleum production was equal to 57% of t total coal output, so that after making due allowance for t large proportion of the fuel load that was in 1942 carried b petroleum, the coal output in 1942 was higher with respect to t potential load placed upon the industry than ever before. (S also FUEL BRIQUETTES.)

(G. A. Ro.)

Great Britain.—In 1942 for the first time Great Britain was reatened with a shortage of fuel, and drastic steps were being ken to deal with the crisis.

The facts were that in 1938 the output was 227,000,000 tons, which 46,000,000 were exported and 181,000,000 consumed at me. In the year ending June 1940 the output was 230,000,000; ports (mostly to France) 45,000,000 and home consumption 5,000,000. For the year 1942 the estimated output was 200,- ,000 tons and home consumption over 210,000,000, consump- n having risen sharply for new war factories and the needs of armed forces, increasing demands upon electricity and gas dertakings as well as railways, in spite of a severe curtailment passenger traffic. Munition industries required 25% more coal n in 1940, electricity stations 40% more, gas undertakings % and railways 13%. The drop in production was almost irely due to a shortage of coal-face workers. When France fell d the possibility of an invasion of Britain was fully realized, ousands of miners entered the fighting services. These men, stly between the ages of 18 and 35, were drawn largely from t most virile class, the coal-face worker. Many of these by 42 were on service overseas and to get them back would be ficult and would also take a very long time. Nevertheless some ooo men had been returned to the mines. At the same time average age of mine workers was increasing.

In June the British cabinet, fully realizing the seriousness of position, outlined its proposals for meeting the situation. ese included control by the government over the operation of coal mines, the allocation of the coal raised and the appoint- nt of a responsible minister to exercise this control.

Compulsory rationing of the domestic as well as the industrial nsumer had not been instituted in 1942 but the scheme was dy for launching. Every person was being urged to economize fuel and it might well be that the combination of increased oduction with voluntary economy would succeed in bridging gap between existing production and consumption.

In spite of the war the government persevered with the valua- n of the coal reserves of the country and on July 3, 1942, rchased for £66,500,000 all the unwrought coal amounting to ,000,000,000 tons. (J. A. S. R.)

ast and Geodetic Survey, U. S.

The personnel and facilities of coast and geodetic survey were utilized exclusively in 1942 provide services and products required for the prosecution of war. In order to concentrate on these war needs, activities rmally carried on in areas essential to the advancement of the nmerce of the United States on land and sea were superseded those performed to meet the requirements of the military and val forces.

Hydrographic surveys were made of selected coastal waters in advance of their use by ships of the navy. These waters were sounded by modern survey methods to supply information of benefit for various operations. Channels were found across foul areas to shorten routes and were dragged to permit passage without danger of grounding on uncharted obstructions. Ocean tides, tidal currents and geomagnetic changes were investigated in widely distributed localities. The results of these observations provided navigators with information of vital need. Magnetic observations supplied data on vertical intensity at selected positions for war purposes connected with magnetic mine defense of coastal areas and the degaussing of vessels. The seismographs of the bureau were continued in operation. Records obtained from these and from other sources were studied to determine the nature of earth shocks and to provide data relative to proposed construction of war plants in earthquake regions.

The bureau provided basic geodetic control for the work of several federal agencies engaged in mapping strategic land areas and performed detail topography as part of an extensive war mapping project. For the latter purpose the nine-lens aerial camera of the bureau was utilized extensively for the first time outside the continental limits of the United States.

The production of all nautical and aeronautical charts was about seven times the normal annual issue, although for purposes of security many were placed on a confidential basis and were not made available to the public. War shipping and naval movements were aided by the compilation of special nautical charts and revised printings of coast pilot information. The aeronautical charting program was expanded primarily to meet the training needs for air pilots, and later was extended to cover world areas to provide the U.S. air forces with compiled maps of the best available information in the standard type of United States aeronautical chart.

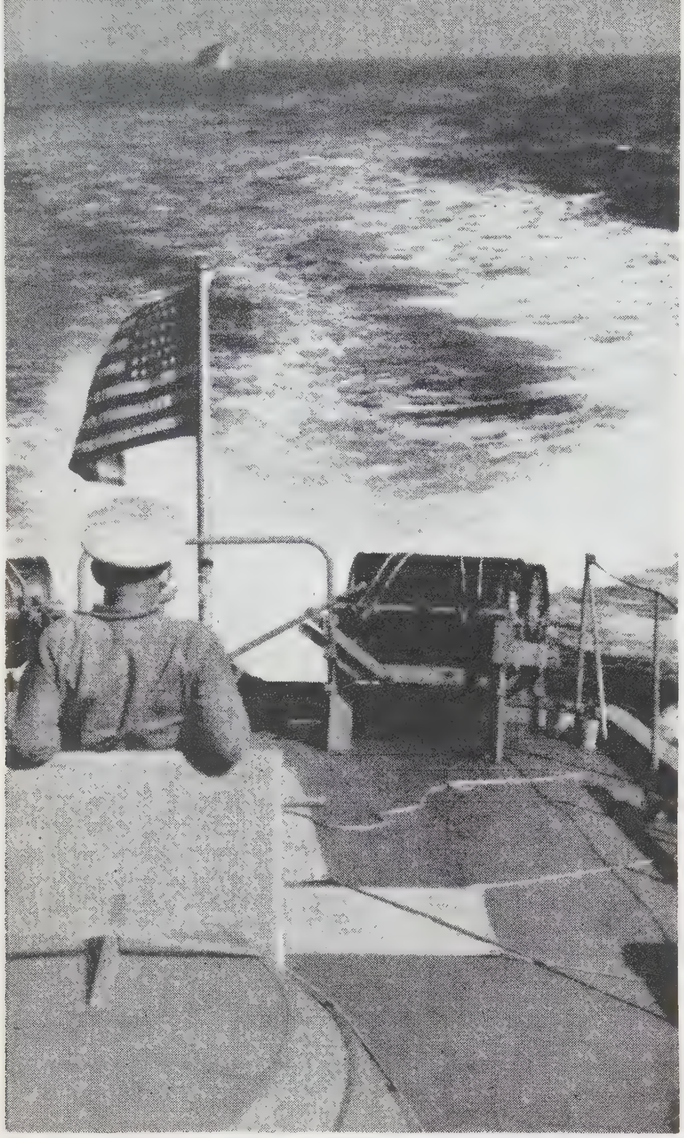
The services of the commissioned officers of the coast and geodetic survey were in demand not only for their normal functions, but for special assignment with the armed forces because of their specialized training and experience. About 40% of these officers were on duty with the army, navy and marine corps at the close of 1942. (L. O. C.)

Coast Guard, U.S.

The year ended June 30, 1942, witnessed the complete transition of the U.S. Coast Guard from its peacetime role as the nation's maritime police, under the treasury department, to its traditional wartime role as a service operating as a part of the navy, effective from Nov. 1, 1942, pursuant to executive order of the president.

The larger cutters and patrol boats, capable of offshore operations, were assigned to the fleet, naval sea frontier or task forces,

U.S. COAST GUARDSMEN rescuing the crew of a grounded navy patrol boat near San Francisco's Golden Gate in July 1942. The men were brought ashore by breeches buoy



COAST GUARD SUB-BUSTER leaving a torpedoed ship (on horizon) off the Atlantic coast in the spring of 1942. After rescuing the survivors, these cutters begin a comprehensive search for the submarine

for convoy, anti-submarine and patrol duty, and aircraft participated in the aerial phase of such duty. The Greenland patrol was made up largely of Coast Guard units. A large force of small motorboats was organized for anti-submarine patrol, for operation under the naval sea frontier forces. One of the peacetime duties of the service in rescuing the shipwrecked found a similar task in war in saving the victims of enemy submarine attacks.

Buoy tenders were engaged in the establishment of mine fields and other anti-submarine defenses. In the development of offshore bases by the navy and for other military operations, large numbers of aids to navigation were provided, in addition to the maintenance of aids to navigation in United States waters. Coast Guard lifeboat stations, light stations and lookout stations supplemented by beach patrols were organized into a co-ordinated observation and protective guard along U.S. coasts.

Additional recruit and training stations were established to meet the demands for personnel for increased duties of the service, for providing landing-boat crews for amphibious forces and for manning of transports and naval auxiliaries.

The Coast Guard academy course was reduced to three years to increase the flow of regular commissioned officers, and a four-months course was instituted for the continuous training of large classes of reserve officers. The Coast Guard reserve was recruited to the maximum strength of training facilities and accommodations, and a strong force of motorboats affiliated with the Coast Guard auxiliary was utilized in assisting in service operations.

Icebreaking operations were carried on upon an expanded sca to insure the maximum utilization of U.S. navigable waterwa in the transportation of iron ore and other essential commoditi in the prosecution of the war. The personnel and certain functio of the bureau of marine inspection and navigation, department commerce, were transferred to the Coast Guard in the expediti of the prosecution of the war effort. Safety equipment aboa merchant vessels, the welfare of the seamen and the utilizati of merchant marine manpower were furthered in every possib manner to meet wartime conditions and requirements; and intensive program of familiarizing the seamen with fire-fightin lifesaving and safety equipment and its operation was carried o

In addition to enforcement of the law and regulations gover ing the anchorage and movements of vessels in navigable wate and supervision over the handling of explosives and other dange ous cargo aboard vessels, the Coast Guard was made responsib for the safeguarding of vessels, harbours, ports and waterfro facilities against destruction, loss, injury from sabotage and oth subversive acts, accidents or other causes; protection was pr vided for important bridges over navigable waters, for canals, ar dams. The nation's largest fireboat organization was establishe and in the interest of the security of the huge supplies of wa materials moving by vessels through U.S. ports, more than million identification cards were issued to officials and employee

Additional buildings, two shipways and one drydock were co structed at the Coast Guard yard, Curtis Bay, Md., and amon the ship and shore projects under way were 4 major trainin stations, 8 major radio stations, 4 large icebreakers, 13 cruisin cutters, 14 tender-class cutters, 6 river tenders, 9 harbour cutte and 1 ice plow.

The strength of Coast Guard personnel and material resourc reached an all-time peak in its history, and service activities combatant war operations and in protective measures for t safety of shipping, property and life were on an unprecedent scale. (R. R. W.)

Coast Guard Academy, U.S.: *see* COAST GUARD, U.S.

Cobalt. While there is a small amount of by-product cob recovered in the United States, the bulk of the supp has been imported as ore from Canada, Chile or Australia, or metal from Belgium or Canada; after 1940 the Belgian Cong residues were shipped to the United States for treatment, inste of Belgium, so that these and Canadian ores were almost t entire source of supply. The total imports in 1940 were equivale to about 2,000 short tons of metal and apparently increase somewhat in 1941. (G. A. Ro.)

Cochin-China: *see* FRENCH COLONIAL EMPIRE.

Cocoa (CACAO). The production of cocoa represents the lar est native industry that has been developed on o continent, Africa. French West Africa produces about 50,000 to of cocoa annually, principally from the Ivory Coast, and in 19 supplied the axis countries with at least 41,000 tons of coco U.S. official reports asserted, indicating a situation that w changed in 1942 by the U.S.-British expeditionary force to Fren Africa. Overproduction continued in 1942 in British West Afri as a result of restricted markets and shipping. The cocoa cr there is about 40,000 tons annually. After the outbreak of Wor War II the British government bought the entire annual crop, su taining a loss of £263,000 thereby in 1940, but making a profit £1,300,000 in 1941. This sum was ear-marked as a further cus ion for the British African cocoa industry but was reported have been probably wiped out by the necessity for buying ar stroying a large part of the 1942 crop. Typical of conditions of e cocoa industry in the western hemisphere was the practice opted in 1942 in the Dominican Republic, where a large part the crop was fumigated and specially prepared to stand a long riod of storage, awaiting available shipping. The Dominican epublic exported 14,181,609 kg. of cocoa the first seven months 1942, compared with 11,043,755 kg. in the same period of 41. Stocks on hand at Bahia, Brazil, in Oct. 1942, were 381,488 gs (60 kg. to the bag), compared with 142,150 bags in Oct. 41. Costa Rica exported 49,444 kg. in Sept. 1942, a drop of ,989 kg. from the exports of Sept. 1941. Grenada exported 57,-2 cwt. from Jan. 1 to Aug. 31, 1942, compared with 51,403 t. in the same period in 1941. (S. O. R.)

oco-Nuts.

Honduras is the only country in Central America where coco-nuts are a chief agricultural product. onsequently, when supplies of coco-nut oil, copra and copra eal were cut off from the Philippines and the Netherlands East dies by Japanese occupation, attention was directed to pos-bilities of expanded production in Honduras. Before World War , the British West Indies normally exported about $690,000 coco-nut products, but coco-nut culture was subordinate to her production—sugar, bananas, coffee and cocoa. Honduras oduced about 10,000,000 coco-nuts annually, but was reported 1942 to have a potential output of 17,000,000. As the ripening riod, September, October and November, coincides with the iny season, production of sun-dried copra had not proved prac-able. Honduras had not, therefore, developed coco-nut oil for port, but instead shipped coco-nuts to the United States to eet the continually increasing demand at Thanksgiving and ristmas time. About 5,000 coco-nuts are required to produce 000 lb. of copra, which, adequately treated with modern ma-inery, yields 1,200 lb. of oil and 800 lb. of copra meal. About 0 lb. of coco-nut carbon may be obtained from 5,000 nuts. (*See* o VEGETABLE OILS AND ANIMAL FATS.) (S. O. R.)

offee.

Scarcity of available ocean shipping exercised more drastic control over the coffee supply in 1942 than d the system of co-operative quota exports adopted in 1941 by e United States and the 14 American coffee-exporting countries. a result, coffee rationing was put in force in the United States Dec. 1942, with household consumption being restricted to 1 lb. r person every five weeks, purchases being regulated by the ue of official coupons.

During 1942 coffee continued to pile up in ports of exporting untries and on Oct. 31, 1942, amounted to 1,752,154 bags (60 . to the bag) at principal Brazilian ports, compared with 1,272,-6 bags at the same ports Oct. 31, 1941. Normally, Brazil pro-ces enough coffee in one year to supply the entire world for 14 onths. Brazil, however, had for years followed a policy of de-roying surplus coffee to prevent market gluts and between 1931 d Sept. 15, 1942, had destroyed 76,235,865 bags. Between Sept. and 15, 1942, such destruction totalled 150,728 bags. Un-icial estimates placed the crop in Brazil at 5,000,000 to 6,000,-0 bags. Freezes in July and August in São Paulo and Parana used much damage to the crop. Brazilian coffee exports in Sept. 42 were 495,642 bags compared with 777,106 bags the same onth in 1941.

The 1942–43 crop in El Salvador was reported as 850,000 bags, which about 250,000 bags had been sold abroad, as compared normal exports approximating 500,000 bags. The 1942–43 crop Ecuador was expected to be about 200,000 quintals (101.4 lb. r quintal), about one-third under normal production. Peru ex-rted 273 metric tons the first six months of 1942 compared with 2 tons the first six months in 1941. The quantity available for export from the 1942–43 crop in Peru was estimated at 43,000 metric quintals of 220.46 lb. each. The Costa Rican crop was estimated as between 555,000 and 600,000 quintals. Exports from Costa Rica in Oct. 1942 were 15,981 bags of 60 kg. each, compared with 18,298 bags in Oct. 1941. Haiti had the unusual experience of exporting more coffee in the fiscal year ending Sept. 30, 1942, than in the preceding year. Such exports in 1942 were 349,253 bags valued at $3,976,274, compared with 329,850 bags valued at $2,083,999 in 1941.

Prices to growers throughout the coffee-producing areas were substantially higher in 1942 than in 1941. By decree of Oct. 2, 1942, all coffee export contracts in the republic of Haiti had to be approved by the National bank, to restrain exporters from depressing prices of Haitian coffee abroad. Exports of coffee from the Ivory Coast constituted 97% of all coffee exports from the seven colonies comprising the federation known as French West Africa. Such exports amounted to 185,707 metric quintals in 1941. No figures were available for 1942. A decree of Aug. 13, 1942, forbade shipment of all coffee waste from the Ivory Coast, indicating that coffee had been added to the list of commodities whose consumption had been curtailed for the benefit of France.

Chicory.—Scarcity and rationing of coffee in the United States revived interest in chicory, the product most frequently used as an adulterant of coffee. The U.S. census of 1940 showed an annual production of 44,122,925 lb. Of this, 44,106,725 lb. were produced in Michigan, although chicory is grown in many states, particularly in areas suitable to sugar beets. In some communities, notably New Orleans, there is a preference for coffee containing chicory. Per capita imports of coffee into the United States, for persons 15 years old or over, increased from 12.6 lb. in 1900 to 17.4 lb. in 1940. Reports in the trade indicated the supply of coffee on hand in the United States Jan. 1, 1943, as about 1,000,000 bags. The normal annual U.S. consumption is approximately 14,000,000 bags. (*See* also BRAZIL; GUATEMALA; RATIONING.) (S. O. R.)

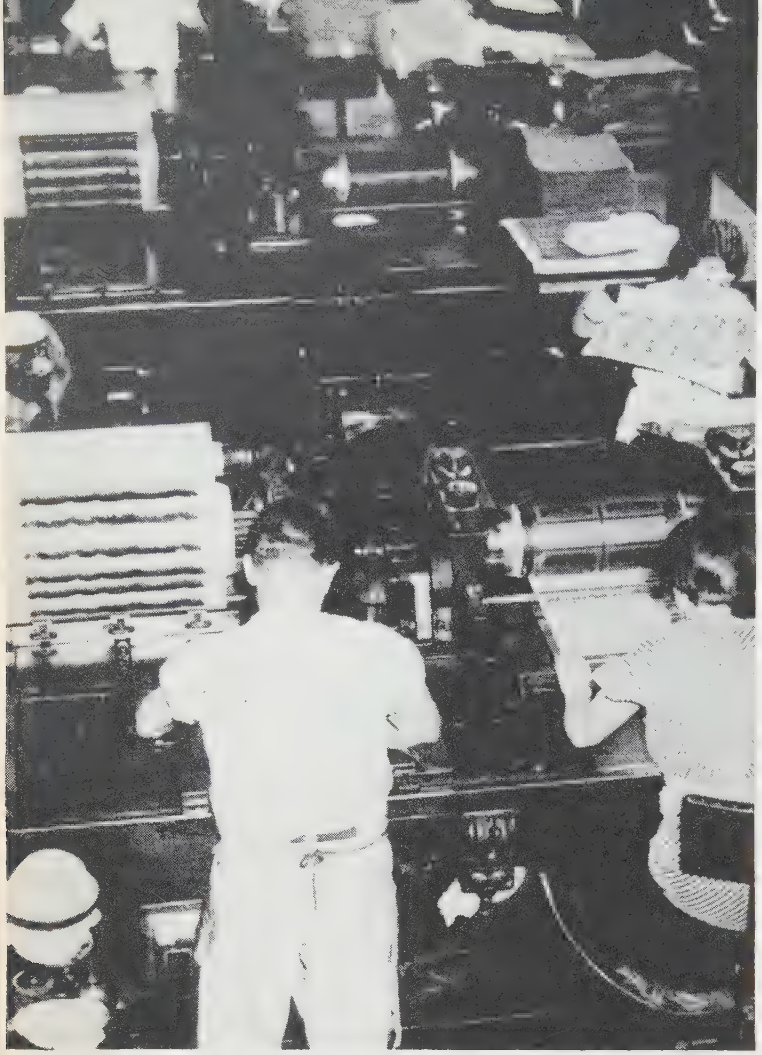
Cohan, George Michael

(1878–1942), U.S. playwright, song writer, actor and producer, was born July 4 in Providence, R.I. One of the most talented showmen in the history of the U.S. stage, he was equally skilled as a song writer. During World War I, he wrote "Over There," a rousing war song which became a minor American classic. In 1940, President Roosevelt awarded him the congressional medal of honour for the writing of both "Over There" and "It's a Grand Old Flag" (1905). Cohan reached the peak of his fame as a song writer, producer and actor in the years between 1910 and 1920. In 1933, he returned to the stage after a short period of retirement to play straight drama in Eugene O'Neill's *Ah, Wilderness!* In 1937, he had a leading role in a musical comedy, *I'd Rather Be Right,* in which he impersonated President Roosevelt. In 1942, a motion picture based on Cohan's life was a nationwide success. Cohan died in New York city, Nov. 5. (*See* also *Encyclopædia Britannica.*)

Coinage.

There were, in 1942, under the bureau of the mint, an adjunct of the treasury department, 3 coinage mints: in Philadelphia, Pa., Denver, Colo., and San Francisco, Cal.; assay offices in New York, N.Y., and Seattle, Wash.; a bullion depository for storage of gold at Fort Knox, Ky., and a bullion depository for storage of silver at West Point, N.Y. The United States mint at New Orleans, which operated as an assay office, was closed June 30, 1942.

Domestic Coinage.—Coinage manufactured by the United States mints for the United States during the calendar year 1942 amounted to 1,630,655,372 pieces, valued at $119,283,799.65.



SHEETS OF 12 $1 BILLS being printed on a flat-bed press in the U.S. treasury. Vigilance against counterfeiting of coinage and currency by axis powers was increased by the U.S. secret service in 1942

Half dollars	71,520,920 pieces
Quarter dollars	138,988,323 pieces
Dimes	315,472,329 pieces
Nickels	154,557,200 pieces
Cents	950,116,600 pieces

The content of the 1-cent piece was changed slightly, through administrative action, Jan. 16, 1942, by eliminating all but a trace of tin from the bronze alloy. It was estimated 100,000 lb. of tin is saved annually by eliminating it from coinage.

The content of the cent, under the law of 1873, had been 95% copper, 5% tin and zinc. The congress on Dec. 18, 1942, authorized a change in the coin, which would be made of zinc-coated steel instead of bronze. The Lincoln design was retained, and the dimensions were unchanged. The weight was to be 41.5 grains, slightly less than the bronze cent, which weighed 48 grains. It was estimated that the change of alloy would result in an annual saving of approximately 4,600 tons of copper for use in the war.

The content of the 5-cent piece was changed by act of congress March 27, 1942. The former alloy, set by law of 1873, was $\frac{3}{4}$ copper and $\frac{1}{4}$ nickel. The new coin was 35% silver, 56% copper and 9% manganese. This change saved annually, according to mint estimates, 435 tons, approximately, of nickel and the same amount of copper for use in the war effort. The Jefferson design was retained, but the mint mark now appeared over the dome of Monticello instead of at the right side of the building. For the first time in history, a United States coin from the Philadelphia mint (which is the original mint), bore a mint mark—the letter "P."

The new alloys for the 1-cent piece and 5-cent piece were adopted strictly as a war measure; the laws authorizing changes were to expire Dec. 31, 1946.

Foreign Coinage.—Coinage for foreign governments amoun to 307,737,000 pieces. The U.S. mints in 1942 executed co for Australia, Bolivia, Curaçao, Dominican Republic, Ecuad Fiji Islands, Netherlands East Indies, Peru and Surinam.

(N. T. R.

Coke.

The production of coke in the United States in 19 increased by 13% over 1940, with 58,482,422 short t of by-product coke and 6,704,156 tons of beehive coke, a to of 65,186,578 tons, besides 4,554,513 tons of breeze or screenin This production of coke required 18% of the year's output coal, the total charged into the ovens being 93,138,153 tons. D ing the year the number of ovens in use increased from 27,884 31,685, with 181 additional ovens under construction at the of the year. The capacity of the ovens in use at the end of year was 73,772,200 tons per year. The largest consumer of coke was the iron blast furnace, which took 77% of the tot domestic use took 10%, gas production 4% and foundries 4%.

Production during the first three-quarters of 1942 totalled 493,187 tons, an increase of 9% over the same period of 19 On this basis the total for the year was expected to be somew greater than 70,000,000 tons.

No information was available from the other important co producing countries, which in order of importance were in 19 Germany, Great Britain, U.S.S.R., France and Belgium.

(G. A. Ro.

Colby, Nathalie Sedgwick

(1875–1942), U.S. novel was born Feb. 4 in N York city. As the wife of Bainbridge Colby, secretary of st in President Wilson's cabinet, Mrs. Colby came in close cont with the upper strata of Washington society. Her observati drawn from these experiences supplied her with rich material her novels. With wit and satire she bared the foibles of Wa ington and New York society in her books. She was the autho *Green Forest* (1927), *Black Stream* (1927), *A Man Can Buil House* (1928), *For Life* (1936), *An American Life Coming* (1937), and *Remembering*, an autobiography (1938). Mrs. Co died in New York city, June 10.

Cold, Common.

According to a one-week survey end Dec. 24, 1941, there were colds in o third of all American homes, with an estimated total of 18,000, persons afflicted. The highest incidence was reported am children under ten. About one in four was treated by a physici

Investigations aimed at preventing colds took various for In a small controlled experiment in the air raid shelters in Brit an antiseptic solution was employed as a spray to each nos Conclusions as to its value were doubtful. Kaiser studied tonsil and adenoid in relation to respiratory infections in child Although he concluded that the tonsils are undoubtedly respo ble for many upper respiratory tract infections in children, he not support the opinion that laryngitis, bronchitis and pneumon can be reduced in incidence by removing tonsils and adeno Two Philadelphia workers noted a great reduction in incide of respiratory infections in a convalescent ward during a per when vaporization of propylene glycol was carried out in ward. Their preliminary observations appeared to confirm effectiveness of propylene glycol vapour as an agent for sterili air in enclosed spaces. This technique might prove to be applica to concentrations such as occur in military barracks. Walsh c tinued his work with nasal vaccines, encouraging enough to w rant further trial of this method in the prevention of the comn cold.

O'Neil divided the upper respiratory infections into those primarily bacterial origin, those in which bacteria are active as secondary invaders, and those in which bacteria, while not actually involved, are always potentially a danger. The organisms involved in the majority of the infections showing bacterial involvement were the haemolytic streptococcus, the pneumococcus and the staphylococcus. Sulphathiazole, he said, is effective against these organisms. It is not a panacea but should be reserved for those cases in which bacterial involvement seems definite. Siegel administered sulphadiazine at the onset of recognizable symptoms of respiratory illness to half of a small group of highly susceptible mentally defective children. Those treated with sulphadiazine appeared less toxic after 24 hours and recovered more promptly. The preliminary observations indicated that sulphadiazine can be advantageously employed early in the course of many acute respiratory illnesses.

Colleges and Universities: *see* Universities and Colleges.

Colombia. A republic of northwestern South America, possessing a littoral on both the Caribbean and the Pacific. Area, 448,794 sq.mi.; pop. (1942 est.) 9,523,200. Most of the population lives in the great Andean valleys drained by the Magdalena river and its tributaries. Capital, Bogotá (395,300). Other cities: Medellín (198,100), Barranquilla (183,500), Cali (121,400), Manizales (99,840), Cartagena (94,700), Ibagué (71,610), Cúcuta (66,080), Bucaramanga (59,940), Pasto (55,760), Santa Marta (37,950), Neiva (36,670), Popayán (32,720), Tunja (23,240). Language: Spanish; religion: Roman Catholic. President (elected in May 1942): Dr. Alfonso López.

History.—The political event attracting greatest attention in Colombia during 1942 was the national election held in May, and the campaign preceding it. The leading candidate was Dr. Alfonso López, president of the republic 1934–38. Long a leader in the dominant Liberal party, he had inaugurated a Colombian "New Deal" during his earlier period in office which had involved a number of social and labour reforms not very pleasing to Conservatives and even to some members of his own party.

In the election, however, Dr. López won, as expected, by a majority of some 200,000 votes. Before taking office in Aug. 1942 he made a flying trip to the United States for a conference presumably on military problems (significant since Colombia is so close to the Canal Zone), control of axis nationals and discussion of transportation needs and priority ratings vital to Colombian industry and general welfare. Shortly after his inauguration he announced a program designed to improve sanitation and dietary conditions among the Colombian lower classes. In order to appease the right wing of his own party, his political appointments included men who had opposed him in the election.

Insofar as hemisphere defense was concerned, the republic continued its policy of co-operation. Public opinion was seriously aroused by the sinking of a Colombian vessel, but not to the extent of a declaration of war (relations with axis powers had been severed in 1941). Extensive controls, involving registration and restriction from a coastal zone, were set up to prevent subversive action by Colombia's 5,000 Germans and 1,000 Italians. A school inspection program was inaugurated to prevent infiltration of foreign ideology; and three German schools were closed. Civilians were prohibited from owning firearms. A compulsory military service act was passed July 9, 1942, and much money was spent for military supplies.

In the economic field, Colombian industry and standards of living were affected by wartime shortages. A National Committee of Economic Study was established in April, to co-operate with the Inter-American Financial and Economic committee. Control over the sale of tires and essential metals was found necessary. All trade in rubber, chicle and balata was first suspended and then put under government regulation; every effort was made to increase the production of wild rubber, even to the extent of construction of an airport in Colombia's Amazon territory. Trade suffered from lack of shipping with the result that some Colombian industries were forced to slow production; this caused unemployment in certain areas. Strikes in government service were prohibited. Decreases in government revenue resulted in the levying of a 3% sales tax on some items, in June, and also the authorization of a 15,000,000-peso bond issue.

One law enacted, which required all firms doing business in the republic to retain a Colombian lawyer to represent them in legal matters, aroused much protest by foreign firms doing business in the state.

Education.—The school system in 1942 consisted of approximately 9,000 primary schools and 450 secondary schools. Enrolment (1939), for all: 700,677. The 1942 budget allowed 7,735,000 pesos for education.

Defense.—The Colombian regular army normally amounts to 16,000 effectives, the navy to 1,625. Military service is compulsory. Colombia in 1942 had 2 destroyers, 4 gunboats. Budget for war (1942): 14,116,000 pesos.

Finance.—The monetary unit is the peso: official value in Dec. 1942, 56 cents U.S. The total public debt (Sept. 1942) was 354,000,000 pesos (225,000,000 external, 129,000,000 internal). Bond issues up to 15,000,000 pesos were authorized by June 1942. Total notes in circulation (Sept. 1942): 106,700,000 pesos; gold reserves were allowed to decrease to 30% for the duration of World War II.

Trade.—Trade for 1942 from January to September totalled approximately 233,000,000 pesos (exports: 154,000,000; imports: 79,000,000). Coffee exports for the period were valued at 114,000,000 pesos; gold, 19,800,000 pesos; petroleum, 13,600,000 pesos. The U.S. normally takes about 70% of Colombian exports and supplies 75% of imports.

Communication.—Maritime communication suffered from war shortages in 1942, particularly in regard to tankers and refrigerated boats. The Magdalena river, important in internal communication, had unusually low water in the summer, which handicapped river traffic.

Agriculture.—Agriculture is the basic industry of Colombia. Coffee, the principal crop (normally 45% of exports), was limited by quota, but increased prices about balanced decreased shipments. The quota was also revised upward in June. Coffee plantations are largely Colombian owned. Banana shipments almost completely ceased during 1942. Cotton production supplies about one-third of domestic needs; Colombia purchased all the Haitian crop for 1942 (value: $471,970). Fibre crop plantings were encouraged by war conditions, also rubber-gathering, with the Rubber Reserve company of the U.S. guaranteeing purchase of the entire Colombian output for five years.

Manufacturing.—The textile industry produced more than 7,000,000 yd. of cloth per month in 1941; shortages of dyestuffs and chemicals possibly cut output for 1942. Cement production in 1941 increased 12% over that of 1940. Most industries suffered from serious shortages in machinery and other equipment in 1942, because of priority regulations in the U.S.

Mineral Production.—Petroleum output in 1941 was 22,216,000 bbl., somewhat below that of 1940 (26,864,000 bbl.). The production for 1942 was even less because of decreased output in the fields and shipping difficulties. The U.S. oil import quota for 1942 allowed Colombia 2,250,000 bbl.

Gold production was decreasing in 1942, while the platinum output was larger.

Colorado. A Rocky mountain state of the United States, in the west-central part; mean elevation above sea level, 6,800 ft. Admitted to the union in 1876 as the 38th state and known as the "Centennial state." Land area, 103,967 sq.mi. Population (1940), 1,123,296; 52.6% urban, 47.4% rural; 93.6% native, 6.4% foreign born; white 98.5%, Negro 1.1%, other .4%; 102.6 males per 100 females. Capital and largest city, Denver, 322,412. Other cities in order: Pueblo, 52,162; Colorado Springs, 36,789; Greeley, 15,995; Trinidad, Boulder, Grand Junction and Fort Collins, 12,000 to 15,000.

History.—John C. Vivian (R.) was elected governor Nov. 3, 1942. Other officers elected were: lieutenant governor, William E. Higby (R.); secretary of state, Walter F. Morrison (R.); auditor, James L. Bradley (R.); treasurer, Leon E. Lavington (R.); attorney general, Gail L. Ireland (R.); superintendent of public instruction, Mrs. Inez Johnson Lewis (D.). The vote for governor was: Vivian (R.), 194,041, Bedford (D.), 149,402. The state property tax was reduced from 4.35 mills to 4.25 in 1941, and to 4.00 in 1942. Robert F. Rockwell, Republican, elected in 1941 to succeed Edward T. Taylor, deceased, as congressman for the Fourth Colorado district, was re-elected in 1942. United States Senator Eugene D. Millikin, Republican, appointed by Governor Carr to succeed Senator Alva B. Adams until the 1942 election, was elected to fill the unexpired term. In 1939 Colorado had four Democratic representatives and two Democratic senators; in 1943, one Democratic and three Republican representatives, and one Democratic and one Republican senator.

Chief Justice John C. Young, by right of seniority in office, became chief justice of the Colorado supreme court. Justice William S. Jackson (R.), appointed in 1941, was elected to fill out the unexpired term of former Chief Justice Francis E. Bouck (D.); Justice Frank B. Goudy (R.), was appointed to fill out the term of Justice Otto Bock (D.), deceased, and was elected for the unexpired term.

JOHN C. VIVIAN, Republican, was elected governor of Colorado Nov. 3, 1942

Education.—There were 225,967 pupils enrolled in public schools in 1942, from kindergarten through high school and vocational schools, with 10,214 teachers. The parochial, elementary and high schools had an enrolment of 913,983, with 515 instructors. Seven state colleges and universities had a total enrolment of 9,961 during the regular term and 8,967 during the summer term, with teaching staffs of 722 and 630, respectively, for the two terms; total annual disbursements, $6,961,697. Privately controlled universities and colleges had a regular term enrolment of 5,828, with 523 instructors, and a summer school enrolment of 1,646, with 149 instructors.

Public Welfare, Charities, Corrections.—Public welfare disbursements in 1942, including $10,164,613 in federal grants amounted to $22,654,046. Pensions, 42,447 persons over 60, $17,032,328; dependent children, 3,931, $2,273,272; blind, 610, $242,878; direct relief, 12,075, $2,565,698; child welfare, 2,840 $41,792; tuberculosis, 337, $131,134; unemployment insurance 300,000 insured in 1941; 212,346 checks totalling $2,229,297.3 in benefits. Four correctional institutions, with 1,961 inmates annual disbursements, $1,430,190. Eight charitable institutions with 6,314 inmates; annual disbursements, $2,709,240.

Communications.—State Highway system in 1942, includin 3,721 mi. federal aid, primary, and 8,128 federal aid secondary totalled 12,390 mi.; city-streets, 3,491; country roads, 36,176 other local roads, 26,423; National forests, 788; toll, 8; total 79,276 mi. Thirty railroads had 4,507 mi. of main line track There were 37 airports and landing fields, and 12,060 license pilots. Number of telephones, in excess of 250,000.

Banking and Finance.—As of Jan. 1942 there were 78 national and 66 state banks; total deposits, $415,238,458, assets $455,331,289; 23 federal and 31 state savings, building and loa associations, with assets of $38,009,531. Biennial state budget $120,967,319. Outstanding state bonds, as of Nov. 30, 194 $2,155,200 net; highway anticipation warrants, $19,780,000 ne

Agriculture.—Farm crops harvested from 6,140,500 ac. in 194 were valued at $97,235,000. Cash farm income was $157,998,000 value of crops and livestock used on farms $8,951,000; government payments, $9,382,000; total $176,331,000. Climatic conditions generally were favourable in 1942, with above-averag precipitation and irrigation water supplies.

Table I.—*Leading Agricultural Products of Colorado, 1942 and 1941*

Crop	Unit	1942	1941
Wheat	bu.	24,764,000	25,036,000
Corn	"	19,342,000	15,026,000

ommodity Credit Corporation. Loan, purchase and sales operations of e CCC were expanded in 1942 to implement farm price support rograms for increased wartime food production and to acquire oreign agricultural commodities needed strategically by the nited States. Loans to farmers totalled $610,000,000 during the scal year 1942 as compared with $452,000,000 in fiscal 1941. urchases in 1942 included approximately $900,000,000 of com- odities for lend-lease export through the Agricultural Marketing dministration.

The increase in volume of loans on commodities stored on rms and in warehouses was the result principally of an increase loan rates to 85% of parity. Legislation enacted in Oct. 1942 ised the rates to 90% of parity on cotton, tobacco, peanuts and ce. Purchases during 1942 included large quantities of agricul- ral supplies for distribution among farmers for the production f commodities formerly imported or for the production of sub- itute commodities. Sales were principally of government-owned mmodities, accumulated in the "ever-normal granary" during receding years, to farmers to increase the production of meats, ilk, eggs and other foods, or for industrial uses such as the pro- uction of industrial alcohol.

Price support programs instituted during 1942 included loans d purchases in connection with vegetable oil crops and oil crop roducts through commitments to producers and contracts with rocessors. The objective was to make possible the maximum pro- uction of vegetable oils needed to replace the reduction in im- orts of oils as a result of the war. Prices to farmers were sup- orted at minimum levels and ceiling prices on finished products were preserved in furtherance of the government program to keep down the cost of living. Similar price-support programs were instituted to facilitate the production of pork by small packers, to maintain milk production in the metropolitan New York area, and to obviate increases in prices of flour and bread.

More than a score of projects were included in the agricultural supplies program, notably the purchase and distribution of supplies for increased production of hempseed and hemp fibre, castor beans, peanuts for oil, sorgo for conversion into alcohol, long staple cotton for aviation fabrics, flax fibre, winter cover crops, hybrid seed corn, pyrethrum seed and naval stores.

Foreign purchase operations during 1942 were for the purpose of acquiring agricultural commodities strategically needed by the United States, and to relieve the economic distress of Latin-American countries whose usual export markets had been cut off by the war. Commitments included the purchase of surplus stocks of cotton in Haiti, Peru and Nicaragua; castor beans, babassu kernels, coffee and cocoa from Brazil, rotenone from Brazil, and flax fibre from Peru. Through Sept. 15, 1942, more than 250,000 tons of 20 different oils and oil-bearing materials had been purchased from countries friendly to the United States; subsequently the corporation appointed an emergency group of importers as its agent to handle imports of fats, oils and oil-bearing materials.

The corporation, created under the president's executive order 6340, Oct. 16, 1933, functions as a part of the U.S. department of agriculture. The corporation is authorized to issue and have outstanding at any one time bonds, notes, debentures and other obligations not to exceed $2,650,000,000. These obligations are fully and unconditionally guaranteed by the United States. The corporation has been continued as an agency of the United States until June 30, 1943, or such earlier date as may be determined by the president. (J. B. Hu.)

Commonwealth Fund, The. This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Edward S. Harkness, president of the fund from its inception until his death on Jan. 29, 1940, amounted in 1942 to approximately $49,000,000. In the year ending Sept. 30, 1942, the fund appropriated $1,777,396.03. Of this total more than two-thirds was devoted to activities tending to promote or maintain physical and mental health. Public health activities, designed to raise standards of rural service, centred in Tennessee, Mississippi and Oklahoma. Thirteen rural community hospitals, built or remodelled with aid from the fund, were at work during the year. New construction was delayed by war shortages. As a means of strengthening teaching resources, fellowships were offered to instructors in medical schools and provision was made for visiting instructors, without restriction as to field; continued aid was given to departments of preventive medicine and psychiatry, to extension teaching and other forms of postgraduate medical education, and to teaching arrangements designed to promote interplay between pediatrics and psychiatry. Nearly $386,000 was appropriated for medical research. The Commonwealth fund fellowships for British graduate students at American universities were suspended for the war, but fifteen fellowships for study in medicine and public health were made available to Latin-Americans. The fund continued to aid child guidance enterprises in England; maintained an advisory service for community mental hygiene clinics in the

United States; and published during the year six books and one pamphlet of educational significance in its fields of operation. The directors of the fund were, in 1942, Malcolm P. Aldrich, president; Phil W. Bunnell, Adrian Massie, George Welwood Murray, Dean Sage, William E. Stevenson and Thomas D. Thacher.

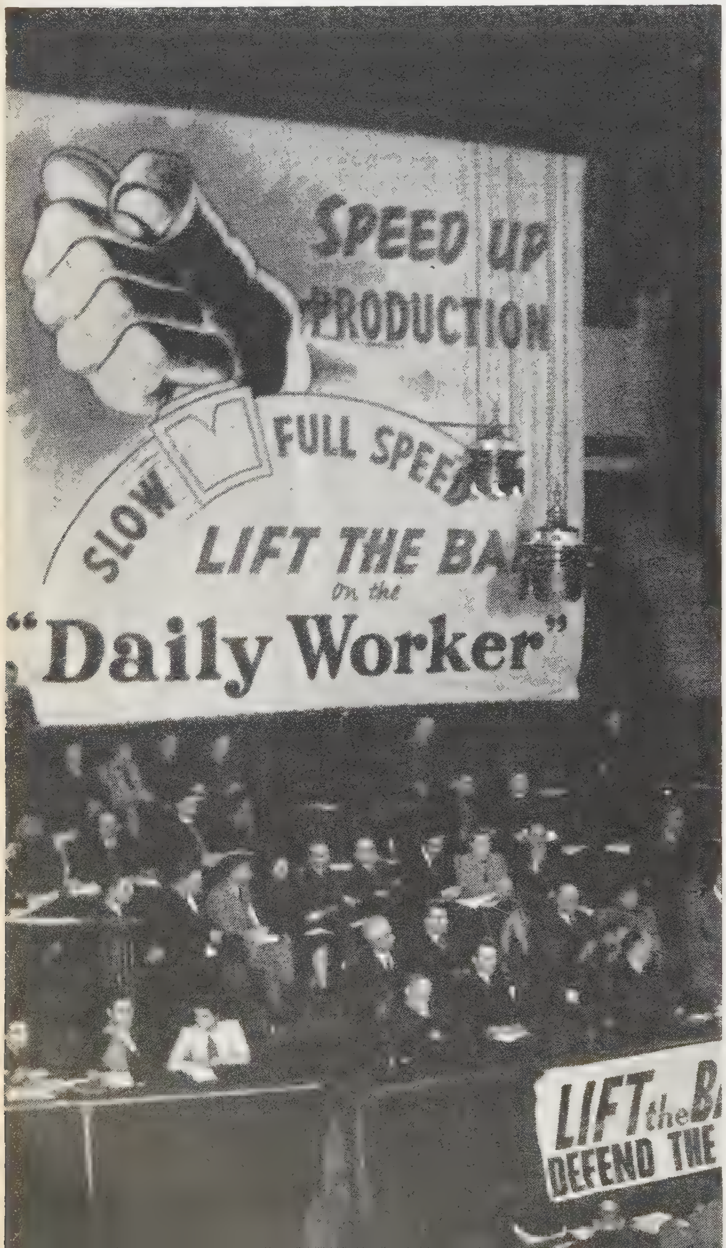
(B. C. S.)

Communications Commission, Federal: *see* FEDERAL COMMUNICATIONS COMMISSION.

Communism, or revolutionary Marxism, is a system of government evolved under the leadership of Lenin and Stalin in the soviet union. Communism believes in the dictatorship of the proletariat for a transitional period, after which a free society would come into existence in which everybody would contribute to the common weal according to his capacities and receive a reward according to his need. This ultimate goal seemed in 1942 still very far away in the soviet union; meanwhile the soviet union represented a dictatorship of the Communist party, with state ownership of all the important means of production. Communism proclaims the equality of all peoples and races and the final establishment of a peaceful international order.

In its foreign policy communism followed strictly the line demanded by the national interest of the soviet union as interpreted by Stalin. The communist parties throughout the world adapted themselves to that line, in complete disregard of the national interests of the country in which they were working. Thus, in Aug. 1939 the soviet union lined up side by side with aggressive fascism against the democracies. The soviet union adopted a most benevolent neutrality toward Germany and made all the official propaganda slogans broadcast by Germany, about the origins and the meaning of the war, her own. The communist parties in France and Great Britain belittled and hindered the effort of these countries to resist fascist aggression, and in the United States the communists declared themselves against all defense measures and against all preparation against future fascist aggression. This attitude of course changed completely with the German attack upon the soviet union on June 22, 1941. Not only did the soviet union offer utmost resistance to fascist aggression but showed itself better prepared than most observers believed. With the existence of the soviet union at stake, communists everywhere suddenly saw the war in an entirely different light and became the most determined proponents of relentless war against Germany. This attitude culminated in their propaganda for a second front in western Europe to relieve the pressure on the soviet union. As the soviet union was at peace with Japan, no demand was raised by communists anywhere for a fight against Japanese fascism. Thus all considerations in World War II centered for the communists around the national existence of the soviet union, not around any principle of an international struggle against fascism. Yet the love of the soviet union inspired not only the people of the soviet union, but communists everywhere, especially in the occupied countries of Europe, to heroic resistance.

BRITISH COMMUNIST MEETING of 1942 at which the government was urged to "lift the ban" on the *Daily Worker*, London communist paper suppressed in Jan. 1941



In the soviet union the national patriotic trend which had been visible already in the preceding years became more and more pronounced. Stalin himself took the lead in a message to the Russian people on July 30, 1942. He called upon them to be inspired in this war by "the daring spirit of our great ancestors," and he set as examples heroes of Russia's feudal past, like Alexander Nevsky, who defeated the Teutonic knights in 1242 and was canonized by the orthodox church; Dmitry Donskoi, who annexed Rostov to Russia in 1380; Prince Pozharsky, who drove the Poles out of Moscow in 1612 and set the Romanoff dynasty on the Russian throne; General Suvorov, who led the Tsar's armies victoriously in the second half of the 18th century; and General Kutusov, who defeated Napoleon. This invocation of the heroic past filled the soviet youth with a deeply national spirit, fundamentally different from the international proletarian spirit prevailing in the first years of the Russian revolution, in which the whole Russian past had been viewed with indifference and even hostility. Heroes of past Russian wars were being as much celebrated as the soldiers and guerrillas of World War II. The literature and the theatre, the movies and sculpture, music and songs, celebrated them. Kosta Simonov glorified them in his melodrama "The Russian People"; Shostakovich wrote in their spirit his seventh symphony, Prokofiev his suite "1941" and his opera "War and Peace," Dzerzhinsky his opera "Blood of the People," and Victor Byely the choral music of "Song of Wrath." Alexey Tolstoy wrote a play in glorification of Ivan the Terrible. No longer was it class origin, but the national achievement which was the basis of the evaluation of figures and movements of the Russian past. The young guerrilla hero martyr Zoya Kosmodemyanskaya, an 18-year-old girl, venerated by the soviet youth, had studied Ilya Muromets and other ancient heroes of Russian ballads as her inspiration.

As a result of this tendency and of the stress of warfare, the soviet attitude to the Russian church changed. Although formerly religious worship had not been forbidden, religious propaganda education was strictly prohibited. Now the officially sponsored ti-religious propaganda of the "Union of the Godless" ceased, e clergy received civil rights and the rôle of religion in Russian story was recognized in a positive spirit. School books and pub- performances were changed in accord with the new trend.

The war generally aroused in the Russian mind not only a irit of fierce Russian nationalism but also, in view of Germany's rocities, a probably unparalleled hatred of the Germans. Again alin set the example in his address of May 1, 1942. And the *Red ar,* the organ of the soviet army, wrote on July 24: "From now , the word 'German' is a terrible curse; it is a word which makes e spring to arms. Indignation is not enough; we must kill. ery day you don't kill Germans is a day wasted." This attitude ain contrasted with former attitudes adopted by communism.

An important change in the outlook of communism produced the war could be seen in a measure taken Oct. 10, 1942, by ich the political commissars as such in the Red Army were olished and full powers of command vested in the army officers, der whose control the political commissars were now placed receiving military rank, after having become fully trained fight- g men. By this measure not only was the command more unified d thus more efficient, but the prestige of the military com- anders was vastly increased. On the other hand, the former litical commissars were added as fighting army officers. This easure increased the number of highly qualified officers and eeded the process of a complete amalgamation of party and my, of political and military command. It expressed also full nfidence in the military chiefs, in the common national effort r the liberation of the soviet union from foreign invaders.

A new attitude toward the church expressed itself also in two easures taken in Nov. 1942. The soviet government appointed e metropolitan Nikolai of Kiev a member of a special commis- on to investigate the damage, the cruelties and the barbarous ts done by the German occupation forces in the soviet union. or the first time a high church dignitary was appointed to an ficial position in the soviet union. This step was matched by e message which the metropolitan Sergei of Moscow, the acting triarch of the Russian church, sent to Premier Stalin on the th anniversary of the communist revolution, in which he eeted him as the "divinely appointed leader of our armed and ltural forces leading us to victory over the barbarian invasion."

Outside the soviet union communist parties and activities re- ained strictly forbidden in all countries under axis control. In e United States, Great Britain and Canada certain measures ken against communist leaders or organs in previous years were scinded; in the United States and Canada some imprisoned mmunist leaders were released; in Great Britain the *Daily orker* was allowed to reappear. Though the strong resistance fered by the soviet union to German aggression aroused wide- read sympathies for the soviet union, communist propaganda rdly made any headway in the democratic countries. (*See* also EMOCRACY; FASCISM; SOCIALISM.)

ommunist Party: *see* COMMUNISM.

ommunity Chest

is the name given to a local co-operative organization of citizens and social elfare agencies; also known as "community fund," "welfare nd," or "united fund." In many communities during 1942 the fa- iliar peacetime community chest organization enlarged to take various appeals for war relief, changing its name to "community ar chest," "united war fund" or variants.

The new war chests differed in structure from place to place. However, the general plan combined with the normal functions of the community chest responsibility for raising the community's contribution to the various appeals for money for war relief causes, insofar as they were approved by responsible local authorities. In most instances, either the war chest was based on the community chest with war relief appeals added, or it was so organized that the community chest, such organizations as USO, the various war relief appeals of the Allies and the War Prisoners' Aid all participated as members of a new organization, usually called a war chest. In many instances, the personnel of the community chest, with necessary supplementation, was responsible for administering the war chest.

In support of voluntary social and health work for 1942, community and war chests together raised $96,287,044. They raised also $8,088,486 for war and defense services and received $200,360 in tax subsidies, making a total of $104,575,890 taken in through 632 chest campaigns during the year. This was an increase of $12,620,908 over the funds raised in 598 campaigns held in 1941.

The average per capita raised for 1942 by 135 chests, which were included in an intensive study, was $1.87. Approximately 33 out of every 100 persons in these 135 cities subscribed to their community chests in 1942, which is 43.5% more than the average number of givers in the same cities for 1935–39, and an increase of 15% over 1941.

On Oct. 1, 1942, 654 community chests were known to exist, 622 of them in continental United States, 28 in Canada, 2 in Hawaii, 2 in South Africa.

Community Chests and Councils, Inc., 155 East 44th st., New York city, the national organization of community chests and councils of social agencies, was organized in 1918 as a clearing house of information for the 21 chests then organized. On Oct. 1, 1942 the number of member chests and councils, affiliated on a voluntary basis, was 419.

Officers for 1942–43 were: Gerard Swope, honorary president; Harry C. Knight, chairman of the board; Robert Cutler, president; vice-presidents, John Stewart Bryan, Harry P. Wareham; J. Herbert Case, treasurer; Lynn D. Mowat, secretary. Allen T. Burns was executive vice-president; Ralph H. Blanchard, administrative director. (*See* also RELIEF.) (A. T. B.)

Community Trusts.

Seventy-six community trusts in continental United States, Canada and Hawaii reported the increase of their philanthropic resources at Dec. 31, 1941 to $54,275,000 from $52,500,000 at the close of 1940. The largest community foundation was the New York Community trust with funds totaling $11,265,624; followed by the Chicago Community trust, $10,541,071; the Cleveland foundation, $6,777,923; and the Permanent Charity fund, Boston, $5,609,590. The total principal of all community trusts passed $25,000,000 in 1928 and $50,000,000 in 1939.

Aggregate outpayments in 1941 totaled $1,605,801 compared with $2,225,396 in 1940 and $1,277,927 in 1939. First in volume of disbursements was the New York Community trust whose appropriations rose to $398,504. The next largest benefactor among these foundations was the Chicago Community trust, followed by the trusts in Boston, Cleveland and Los Angeles.

The initial community foundation was established in Cleveland, Ohio, Jan. 2, 1914 to afford an opportunity alike to individuals of wealth or modest means to establish perpetual charitable funds by will or trust deed, secure from the ravages of time and the Dead Hand. (R. Hs.)

Conant, Gordon

(1885–), Canadian politician, prime minister of Ontario after the resignation of Mitchell Hepburn, Oct. 21, 1942. He was born Jan. 11 at Oshawa, Ont., of a United Empire Loyalist family still holding their original lands. He was educated in the Oshawa schools, graduated B.A. from University college, Toronto, in 1905 and received his LL.B. in 1912. He practised law in Oshawa and was early in politics, being secretary of the Liberal association for 25 years. Conant was active in the civic life of Oshawa, holding office as alderman and as mayor. He was made a K.C. in 1933 and upon election to the Ontario legislative assembly was appointed attorney general in 1937. From this office he was elevated to that of prime minister.

Congregational Christian Churches.

This denomination is made up of what was previously two denominations: the Congregational, established in America in 1620 at Plymouth, Mass., and the Christian, which grew up about the time of the Revolutionary War. Finding they had much in common, the two groups merged into the present body in 1931.

The denomination is governed by two cardinal principles: freedom of the local congregation in everything that concerns its life and work; and fellowship of all the congregations in common enterprises. This freedom is not license; it is a regulated freedom. The regulation comes from within, not from without. There is no power that can compel a congregation to do anything it does not wish to do. The slight measure of denominational control of a local church lies in the association to which the church belongs. This association is made up of official delegates of the churches that belong to it. It meets twice a year. The representatives of the churches make such reports of their life and work as they deem will be of interest, but there is no set form of report nor are there formal questions to be answered.

If, however, a congregation is pursuing a course the delegates from other churches of the association deem is unwise, inquiry may be made, usually through a council called for this specific purpose, and if the course of the church is found not in harmony with the basic ideas of the association or council, the association has but one means to register its judgment and that is to withdraw fellowship, if and when the congregation has declined to change its course. That is the only measure of control the denomination can exercise.

There is no written creed or discipline, but the denomination is not lawless, for there is a body of tradition and precedent reaching back through 300 years during which these churches have sought to develop church life and work on the principles laid down in the New Testament. In present day life they seek to embody the spirit and teachings of Jesus Christ. The authority that governs is the understanding by the members of the will of God as evidenced in the life and teachings of Jesus and interpreted by Christian experience through the ages.

Within the congregation there is the same freedom as among the churches. Each person is entitled to interpret Christian teachings for the guidance of his own life. If his conduct or language is contrary to the generally accepted interpretation of Christian teachings, the congregation may withdraw fellowship after a full hearing. That is the extent to which discipline of the individual may be administered. There are no such things as heresy trials among Congregationalists, as there are no official creeds to serve as standards for such a trial.

The same liberality extends to the churches' attitude towards the clergy. Through the centuries the churches have insisted on a educated ministry. To insure a supply of educated ministers th early churches founded Harvard and Yale universities to trai young men for the gospel ministry "when our present pastor shall lie in the dust." A candidate for the ministry enters into th pastorate by a process of ordination and election. The election by the members of the Church. No outside person or body ha any official voice in this election, and the congregation fixes th terms under which the minister serves and has power to terminat the pastorate without outside interference.

The ordination, however, has more denominational supervisio Here the churches in the vicinity, or members of the associatio send delegates to an ordaining council on invitation of the churc sponsoring the candidate. These delegates are lay and clerical an all members have equal vote. The candidate presents a statemen of his belief and Christian experience, and if these are in gener accord with Christian teachings, the ordination proceeds. Ther are no official tests on the basis of creed; questioning is on th basis of New Testament teachings.

During the year 1942, the National meeting of these church was held at Durham, N.H. The reports showed that during th preceding biennium the number of churches had increased 90, t a total of 6,096. The membership increased 15,531, to a tot of 1,058,807.

The central office of the denomination in 1942 was the Gener Council of Congregational Christian Churches, 287 Fourth Av nue, New York, N.Y. (F. L. F.)

Congress, United States.

The 78th U.S. congress m for its first session Jan. 1943. It comprised the following members (as of Jan. 15, 1943

United States Senate (†re-elected in 1942)

Presiding Officer: Henry A. Wallace, Vice-President the United States
Majority Leader: Alben W. Barkley, of Kentucky
Minority Leader: Charles L. McNary, of Oregon

THE U.S. FARM BLOC'S IDEA of killing inflation, as satirized by Duffy of the Baltimore *Sun*. "Let's bury him just a *little* bit," says the farm-minded congressman. The senate's farm bloc fought bitterly against the farm-price ceilings of the anti-inflation bill passed by congress Oct. 2, 1942

Congress of Industrial Organizations.

Most noteworthy in the record of the CIO for 1942 was the activity of the CIO's 5,000,000 members in working and fighting for victory in the war of survival against the axis.

Following up its action in promoting the Industry Council plan for greater production, various affiliates of the CIO came forward with detailed plans for increasing output in their industries. A number of these plans were adopted, and greatly increased production of war materials and supplies.

CIO affiliates functioned effectively in the joint labour-management production committees, some 1,700 of which were set up throughout war industry. Hundreds of CIO organized plants won army-navy E awards for excellence in production, and thousands of individual CIO members won official recognition for their own contributions to increased output.

On the legislative side, and in co-operation with government war agencies, the CIO pressed for increased labour representation

A SHOWER OF CONFETTI testified to the popularity of Philip Murray, president of the Congress of Industrial Organizations, at the convention of the United Automobile Workers in Chicago in Aug. 1942

to bring the skill and experience of organized workers to bear on problems of production. At its Boston convention in 1942, the CIO unanimously pressed a demand for centralized, over-all national planning under one federal war mobilization agency.

The Boston convention was also marked by CIO resolutions calling for a second land front against nazi Germany; for total mobilization of all resources for total war and victory; for unity between U.S. labour movements and for co-operation between the labour movements of all the United Nations, including Latin America through direct contact; for freedom for India; for stabilization of the national economy through price control, rationing and taxation on ability to pay; for greater effort in organizing workers for victory; for abolition of the poll tax and similar measures.

Philip Murray was re-elected president at the convention and James B. Carey, secretary-treasurer. (*See* also AMERICAN FEDERATION OF LABOR; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (P. MY.)

Connaught, Arthur William Patrick Albert,

DUKE OF (1850–1942), third son of Queen Victoria and great uncle of King George VI, was born May 1 at Buckingham palace. In 1899, he succeeded to the duchy of Saxe-Coburg and Gotha on the death of his elder brother, Alfred, duke of Edinburgh, but renounced his rights because he wished to remain an Englishman. The duke of Connaught, senior field marshal of the British army, was appointed on his 86th birthday by Edward VIII as the first of his personal aides-de-camp. Because of failing health, the duke remained in seclusion at his country home, Bagshot Park, Surrey, after the start of World War II. He died at his home Jan. 16, the dukedom passing to his grandson, 27-year-old Alastair Arthur, earl of Macduff. (See *Encyclopædia Britannica.*)

Connecticut.

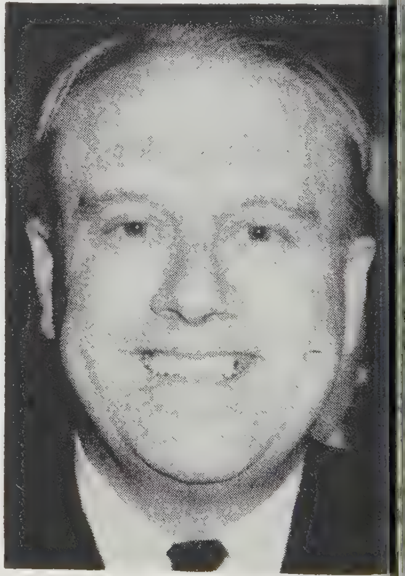
The most southwesterly of the New England states, Connecticut is popularly known as the "Nutmeg state" and the "Land of Steady Habits"; land area, 4,899 sq.mi.; population (1940), 1,709,242, an increase of 6.4% over 1930. Capital, Hartford (166,267). Other cities with more than 50,000 population in 1940: New Haven (160,605); Bridgeport (147,121); Waterbury (99,314); New Britain (68,685). Of the state's population in 1940, 1,158,162 were urban, or 67.8%. In 1940 there were 1,675,407 whites; 32,992 Negroes; 1,347,466 native born; 327,941 foreign born. Especially in and around the 24 leading industrial centres, the population of the state gr greatly after the 1940 census, though no statistics of the increa were available in 1942.

History.—The principal officers in 1942 (for the term 1941–4 were: governor, Robert A. Hurley (Dem.); lieutenant-govern Odell Shepard; secretary of the state, Mrs. Chase Going Woo house. The Republicans carried the state election in Nov. 194 electing for the 1943–45 term: governor, Raymond E. Baldw (281,362 votes, against Hurley, Democrat, 255,166, and McLev Socialist, 34,537); lieutenant-governor, William L. Hadden; sec tary of the state, Mrs. Frances B. Redick. The Republicans al won additional representation in both houses of the gener assembly, as follows: Senate, 22 Republicans, 14 Democrat House, 201 Republicans, 71 Democrats. The general assemb was not in session in 1942, except for a very brief special sessi to remedy a defect in the election laws.

Education.—In 1940–41 the enrolment in 866 elementa schools was 184,388, with 5,395 teachers. In 39 junior hi schools, with 619 teachers, there were 23,170 pupils enrolled; 84 senior high schools, with 2,329 teachers, the enrolment w 89,568. In 1941–42 enrolment declined to 167,912 in elementa schools, 21,732 in junior high, and 84,546 in senior high. Curre expenses for 1941–42 were $29,776,000, of which nearly 70 was for salaries; capital outlays were $4,989,000.

Public Welfare, Charities, Correction.—June 1942, 2,3 persons on WPA payrolls received $190,734, a decrease of mo than 50% from the preceding year. In the same period, gener relief payments for 13,186 town charges amounted to $208,03 and for 4,701 state charges to $94,201. In the same month, 17,5 beneficiaries received old age assistance amounting to $516,5 and 189 blind received payments of $5,267. Also in June, 6,1 persons received $95,972 for aid to dependent children.

Communications.—Up to Nov. 10, 1942 the number of c registrations had decreased slightly, being 562,184, but the nu ber of operators' licenses had increased slightly to 614,790. T state highway system in 1942 included 2,890 mi. of trunk li and state-aid roads, of which 60 mi. were improved during t year, and about 1,600 mi. of town-aid roads. During the year the most important construction was the continuation of the Wilbur Cross highway, for which the new bridge over the Connecticut was opened at Hartford in Sept. There were 812 mi. of railroads in operation in 1942, most of which belonged to the New York, New Haven, and Hartford system. As of Nov. 1, 1942, the Southern New England Telephone company had 451,201 telephones in service in the state. There were about 10,000 telephones serviced by other companies.



RAYMOND E. BALDWIN, Republican, w elected governor of Connecticut Nov. 3, 194

Banking and Finance.—On Sept. 30, 1942 the 72 mutu savings banks in the state had total deposits of $787,742,241 a total assets of $885,934,843. The number of accounts was 1,01 581. The 64 state banks and trust companies had total assets

3,124,727, with savings deposits of $121,110,011. The 52 ional banks on April 4, 1942 had total assets of $480,374,000. rtford is the headquarters of most of the 25 large insurance npanies operating under Connecticut charters. The five Concticut life insurance companies wrote 10% of the ordinary life urance of the country and 36% of group insurance. The eight nnecticut casualty companies wrote 20% of all casualty siness in the country.

The state income for the fiscal year ended June 30, 1942 was ,672,228 and the net expenditures were $71,277,045. Of the penditures, $28,683,356 was for the general fund, $27,076,440 highways and bridges, $6,632,804 for old age assistance, and 083,160 for unemployment compensation. On June 30, 1942, state's bonded debt was $30,213,000, partly offset by $10,681,- in the retirement fund.

Agriculture.—According to the census of 1940 there were 163 farms in the state, of which all but 8% were operated owners. The acreage under crops in 1941 was 357,800 and market value of products was $67,299,000. Conditions in 2 were favourable to production, and marketing conditions proved except in the case of garden products.

Leading Agricultural Products of Connecticut, 1942 and 1941

Crop	1942 (est.)	1941
ay, tons	430,000	403,000
obacco, lb.	21,960,000	23,370,000
otatoes, bu.	3,078,000	2,862,000
orn, bu.	2,021,000	1,974,000
pples, bu.	2,030,000	1,412,000

Manufacturing.—The census report showed, in 1939, 2,936 nufacturing establishments in the state employing 233,525 ge earners with products valued at $1,229,585,773. In 1942 se numbers had increased respectively to 3,350; 491,000, and 000,000,000 approximately. In 1942, Connecticut ranked first ong the states of the union in per capita production of war terials. The index of general business activity in the state in e 1940 was 10% above normal; in June 1941, 72% above; l in June 1942, 93% above. Building contracts awarded in 1941 re approximately 95% above the combined total for the two eceding years, and the early months of 1942 showed a still ther increase. While Connecticut leads in the manufacture aeroplane motors and propellers, submarines, and small arms munition, it is also a large producer of a wide range of other es of war materials.

Mineral Production.—The state's mineral production is relaely negligible, the principal products being stone, valued at $2,- ,366 in 1939, and clay, valued at $1,257,049. (G. M. Du.)

nservative Party, Great Britain.

A decision to call, in March 1943, first full party conference since the war began was the outnding event of the Conservative and Unionist party's year. thout breaching the political truce, agreed with the other rties on the declaration of war, this marked a feeling, which l steadily grown during the year, that as the principal partner nind the national government it must prepare for postwar difences of outlook.

The importance of the party's making its own contribution to the common pool when the time for reconstruction comes was emphasized in a letter from the prime minister, as its leader, to Mrs. Lionel Whitehead, chairman of the Conservative Central council, when she presided at the second of its two meetings in October. Winston Churchill referred to the government's concern, as shown by the charging of ministers with specific responsibility for postwar planning, and added: "This does not absolve the organization of our party from pursuing its own survey."

One of these surveys excited controversy within the party itself. It came from the education subcommittee, over which Geoffrey Faber presided, and for which W. F. Oakeshott, high master of St. Paul's school (a member), had prepared a "plan for youth." Nearly all the comments at the central council meeting were critical, especially of its insistence on compulsion. In consequence the subcommittee was to think again. But a second report was commended by R. A. Butler (president of the Board of Education and chairman of the party's central postwar problems committee) as "inspired by a sincere belief that the country has definite spiritual needs" and this won general acceptance.

Mrs. Whitehead, who was elected chairman at the earlier council meeting in March, was the sixth woman to hold that office. At the same meeting the marquis of Salisbury was elected president of the National Union of Conservative associations. During 1942, Sir Douglas Hacking retired from the chairmanship of the party organization and Major J. L. Dugdale became chairman. The two vice-chairmen were Col. H. P. Mitchell and Lady Hester Bourne. Lord Marchwood remained treasurer of the party and Sir Robert Topping general director. The central offices were removed during the year to 24–26 Old Queen St., Westminster S.W.1.

In parliament the party, which (including 10 Ulster unionists) held 364 of the 615 seats, steadfastly supported the war policy of the coalition government while continuing to express its own viewpoint through the 1942 committee, of which A. G. Erskine-Hill was chairman. (L. D.)

Consumer Credit.

The outstanding amount of consumer credit in the United States in 1942 had grown enormously during the preceding 50 years. The expansion of instalment credit had contributed a very large part of the growth, particularly after 1920. The long-term expansion had been interrupted, however, by cyclical fluctuations. After reaching a peak of $8,200,000,000 in 1929, the outstanding amount of consumer credit declined sharply to about $4,600,000,000 in March 1933. Then another period of expansion carried the total to $8,500,000,000 in Sept. 1937. This new peak was followed by a sharp decline until the latter part of 1938, when a new expansion began. By Aug. 1941, an all-time high of about $10,200,000,000 had been reached.

These fluctuations were caused by changes in the national income. When incomes rise, people tend to expand their credit; and when incomes fall, they tend to repay their obligations. In addition, however, fluctuations of consumer credit contribute to the expansion and contraction of incomes. Expansions of consumer credit tend to pour additional funds into the income stream, while contractions tend to reduce the flow of income funds. Thus consumer credit has served to exaggerate and to prolong business booms and depressions.

Recognition of these characteristics led in 1941 to control by the federal government. Under authority of an executive order dated Aug. 9 of that year, the federal reserve board undertook to restrict consumer credit as a means of partially offsetting the inflationary forces generated by the rapid expansion of military expenditures. Regulation W, which became effective Sept. 1, prescribed minimum down-payments, varying between 10% and

$33\frac{1}{3}\%$ of the purchase price, and a maximum maturity period of 18 months for instalment sales of an extensive list of consumers' durable goods. It imposed the same maturity limitations upon all instalment loans of $1,000 or less. The latter figure was later increased to $1,500.

The initial regulation was directed primarily toward the curtailment of demand for specific goods the manufacture of which used machines, materials and skills needed for military production. Important amendments which became effective early in 1942, however, were designed to create a general deflationary force by inducing a broad liquidation of consumer credit. The amendment of March 23, 1942, added additional articles to the list subject to credit restrictions, increased minimum down-payments and reduced the maximum maturity period for instalment loans and most listed articles to 15 months. The amendment of May 6, 1942, which followed closely the President's seven-point stabilization message to congress, further increased down-payment requirements, reduced the maturity for instalment loans and most listed articles to 12 months and restricted charge accounts. The charge-account provision required merchants to suspend further credits for listed articles where accounts remained unpaid on the 10th day of the second month following the month of purchase.

Prior to the date of the initial regulation, consumer credit had been expanding at the rate of about $1,500,000,000 a year. The regulation immediately reversed this trend. The liquidation was gradual at first; but it accelerated, as the result of the March and May amendments, the restriction of automobile sales through rationing, and the discontinuance of production of many consumers' durable goods that had commonly been sold on credit.

Between Sept. 1, 1941 and Sept. 1, 1942, the outstanding amount of consumer credit declined by about $3,000,000,000. The liquidation for the calendar year 1942 was estimated at between $3,500,000,000 and $4,000,000,000. Roughly half of the liquidation was attributable to the discontinuance of production of consumers' durable goods and the remainder to the restrictions imposed by the regulation. The liquidation produced a deflationary force of substantial magnitude which contributed importantly to the stabilization of the price level.

A considerable volume of necessitous borrowing and essential credit buying could not be eliminated without great inconvenience and hardship, and to attempt to do so would have led to the development of black markets for credit. Consequently, the rate of liquidation of consumer credit was not expected to decline early in 1943. In view of the gradual loss of the deflationary effects from this source, the Office of Price Administration developed a plan for selling consumers' durable goods, which had disappeared from the market, for postwar delivery. Payments for such goods would replace payments on previous instalment purchases as contracts were completed and in this way the deflationary effects of instalment payments could be continued and even increased.

Under this proposal, consumers who purchased postwar-delivery certificates would be entitled to a prior claim to postwar production and a price discount. Sales and collections would be made so far as practicable through regular dealers and finance agencies. Funds would be channelled to the United States treasury, which would have the use of purchasers' payments pending the restoration of production.

During 1942, the regulation of consumer credit for economic purposes overshadowed the regulation of consumer credit for protecting debtors, a traditional function of state governments. There were no significant changes in the latter field during the year. (R. Nt.)

Continental Divide Tunnel: *see* Tunnels.

Contract Bridge. The war had less impact on contra bridge in 1942 than might have been e pected. Reliable indices of popularity, such as the sale of playin cards, bridge books, and other paraphernalia, attested to the co tinued popularity of the game, and even tournament bridge d not suffer greatly reduced attendance. There were no chang in any of the leading systems—such as the Culbertson syste or the Four Aces' system—nor was there any revision in t official laws of the game, although such revision was envisag for 1943.

The results in the three leading tournaments conducted by t American Contract Bridge league, governing body of almost tournament bridge played in the United States, were as follo in 1942:

Eastern States Tournament, New York., N.Y., Feb. 28–Mar 6, 1942. Open Pairs: won by Richard L. Frey and A. Moyse, J New York city; Open Teams-of-Four: won by Harry J. Fishbei Tobias Stone, George Rapee and B. Jay Becker, New York ci and Simon Becker, Philadelphia; Women's Pairs: won by Mr Barbara Collyer and Mrs. Erwin Seligman, New York city; Mix Pairs: won by Mrs. A. M. Sobel and Edward Hymes, New Yo city; Non-Master Pairs: won by Jules Aceeves and Joseph O'Co nor, New York city.

Summer National Tournament, New York, N.Y., Aug. 3– 1942. Masters' Pair Championship: won by Mrs. A. M. Sob New York city, and Charles H. Goren, Philadelphia; Maste Team-of-Four Championship: won by Richard L. Frey, Sa Stayman, Sigmund Dornbusch, Murray Seiler, Lee Hazen, Ne York city; National Men's Pair Championship: won by Robe von Engel, New York city, and Aaron Goodman, Montreal, Can National Women's Pair Championship: won by Mrs. Erwin Seli man and Mrs. Mae P. Rosen, New York city; Mixed Team-o Four Championship: won by Waldemar von Zedwitz, New Yo city; Mrs. Olive Peterson and John Crawford, Philadelphia, Mr Wilkinson Wagar, Atlanta; Non-Masters Pairs Championshi won by F. P. Begley and Dr. Kalman Apfel, New York city Amateur Team-of-Four Championship: won by Mrs. C. Va Slochem, Mrs. Julius Daub, Arthur Jarmel and Morris Straus New York city.

Winter National Tournament, Syracuse, N.Y., Nov. 30–De 6, 1942. Open Pairs: won by Tobias Stone, New York city, an Alvin Roth, Washington; Women's Team-of-Four: won by Mr Benjamin M. Golder and Mrs. Olive A. Peterson, Philadelphi and Miss Ruth Sherman and Mrs. Olga J. Hilliard, New Yor city; Mixed Pairs: won by Miss Ruth Sherman and Harry Fishbein, New York city; Open Teams-of-Four: won by Charl H. Goren, John R. Crawford, Sidney Silidor, and B. Jay Becke Philadelphia; Amateur Pairs: won by Kenneth Cadawallade Syracuse and Arthur Waterbury, Euclid, N.Y. (E. Cul.)

Cooper, Sir Edwin (1874–1942), British architect, wa credited with having designed mo buildings in the old City of London than any architect since S Christopher Wren. His most important work was the Port o London Authority building on Tower Hill. He was made a honorary member of Lloyd's for his design of the company Royal Mail building.

He was knighted in 1923, won the Royal Gold medal in 193 and was an associate of the Royal academy. He died in Londo June 24.

pper. There were no production statistics from most of the important producing countries after 1939, so that y of the later data in the accompanying world table are esties; only those figures in which a decimal is used are reported outs. So far as could be determined at the close of 1942, protion exceeded that of the preceding year by about 10% in o and 7% in 1941.

he mine production of copper in the United States in 1941 958,147 short tons, smelter production from domestic ores ,072 tons, and refinery production from domestic ores 975,408 ; the total refinery production, including 419,901 tons from ign ores, was 1,395,309 tons. In addition to this supply of copper there was a recovery of secondary copper from old p amounting to 412,699 tons, and 313,697 tons was reworked n new scrap.

mports were reported only for the first nine months of 1941, these amounted to 745,736 tons as compared with 559,679 in the full year 1940; in the same periods exports had ined from 804,758 tons to 185,617 tons; hence a net export of ,079 tons in 1940 had been shifted to a net import of 560,119 for the first three-quarters of 1941.

ombining the various data cited above, we have the following the make-up of the known available supply for 1941:

Refined from domestic ores	975,400 tons
Recovered from old scrap	412,700
Recovered from new scrap	313,700
Received from net imports	560,100
Total known supply	2,261,900 tons

n the other hand, it was reported from the War Production rd that the total supply in 1941 was 2,467,100 tons, as comed with 1,913,000 tons in 1940. Presumably the official figure uded imports for the full year, and therefore should be larger, er than smaller than the known supply tabulated above. In same official report the total supply for 1942 was estimated ,571,700 tons, though it was also stated that the essential irements for the year were 8% in excess of this figure, and total requirements exceeded it by 25%. Unless something stic could be done about shortage of mine labour and equipt, it seemed that domestic production had about reached its t, and improvement in the copper position depended on increased imports, more active scrap recovery, and a more extensive use of substitutes.

The copper shortage was frequently criticized as being unnecessary, had there been proper utilization of the supplies at hand. There were arguments on both sides of the question, of which probably the most striking one was that from such statistics as were available it seemed apparent that the amounts of copper made available to the war effort in the United States in the years 1941 and 1942 were equal to and possibly exceeded the total amounts that had been available in Germany during the previous ten years, including scrap recovery in Germany itself and from the occupied areas after they were taken over.

There was some time during World War I when copper sold for more than 30 cents per pound, but in World War II the price was under control from the start, with the result that the price at the close of 1942 in a market where demand far exceeded supply was 12 cents less than the price before the war began.

Indications as to the trend of operations in 1942 were scarce. The United States statistics were suspended after the publication of the May data, which showed a production of 456,486 tons in the five months, and total deliveries, including imports, of 589,925 tons. In Chile the total of the first four months was 156,800 metric tons, 4% better than the 1941 average. The Mexican total for three months was only 8,100 tons, down one-third from the 1941 rate. In Peru the exports through July were 18,400 metric tons, 14% ahead of 1941. Data were entirely too scanty to justify any attempt to estimate world production. Copra: *see* COCO-NUTS.

Copyright. In 1942 there was no amendment to the Copyright act. Several copyright bills were introduced in congress, but because of the exigency of other matters no final action was taken. On Dec. 18, 1941 the president approved the "First War Powers Act, 1941" (Public Law 354) confirming, ratifying and amending The Trading With the Enemy act of Oct. 6, 1917 (40 Stat. 411) as amended. Under Section 10 of the latter act enemy aliens may file and prosecute in the United States applications for letters patent, or for registration of copyrights, subject to regulations issued by the Alien Property Custodian.

During the year 1942, there was some falling off in the number of copyright registrations, especially in relation to foreign works published abroad; yet despite the war the gross receipts of the copyright office for the fiscal year 1942 ($376,906.63) reflect the largest copyright business in the history of the office.

The copyright law in force requires, as one of the conditions precedent to the registration of a claim to copyright in any work, the deposit of two copies of American books and one copy of foreign books, for the enrichment of the Library of Congress. During the fiscal year 1942, 286,436 books and other articles were deposited, including 20,754 printed volumes, 67,240 pamphlets and leaflets, 90,290 periodicals, 5,468 dramas, 60,098 pieces of music, 2,402 maps, 2,543 photographs, 20,026 prints, labels and pictorial illustrations, 4,319 motion pictures, and 6,054 works of art and drawings. These were all produced in the United States. From abroad there were received 651 books in foreign languages and 509 books in English. Of this great collection of copyrighted works, 174,355 were transferred to the permanent collections of the Library of Congress; 1,863 were sent to other governmental libraries, and 4,094 were returned to the claimants of copyright. Corn

(Maize). Corn production in the United States in 1942 set an all-time high of 3,175,154,000 bu., which was 105,000,000 bu. more than the previous record of 3,070,000,000 bu. in 1920. The yield per acre in 1942 was also the highest on record, 35.5 bu. per ac. compared with the previous high of 31.7 bu. per ac. in 1906. Yields were well above average in most states, but high records were made in Iowa, Indiana, Ohio, Illinois, Michigan and Wisconsin because of widespread seeding of hybrid varieties. The foregoing figures are estimates as of Dec. 1, 1942, by the department of agriculture and relate to corn harvested for all purposes, for grain silage, forage, hogging and grazing. About 91% of the total crop, or 2,884,744,000 bu., was harvested for grain, compared with 2,435,307,000 bu. harvested for grain in 1941, when the total crop was 2,677,517,000 bu. The ten-year (1930–39) average was 2,307,452,000 bu. Corn silage production in 1942 was estimated at 33,927,000 tons. In addition, 4,651,000 ac. were hogged down or used for grazing or forage. The total acreage of corn harvested was 89,484,000 ac. in 1942, and 86,186,000 ac. in 1941. The ten-year average was 98.049,000 ac. The increased production on smaller acreage indicated the rapid spread of the higher-yielding hybrid varieties throughout the corn belt. The 1941 yield of 31.1 bu. per ac. was the third largest on record. The 1942 record crop was considered remarkable not only because of its size, but also because it was produced under adverse conditions. In many important sections planting was one to three weeks late, and continued rains prevented good cultivation. An early June drought threatened the crop in the south central states, but rains late in the month brought relief. In the northern states early freezing temperatures stopped plant growth at least a week earlier than usual. Corn harvested for grain in Canada in 1942 was estimated at 14,372,000 bu., compared with 13,362,000 bu. in 1941; corn fodder, 4,491,000 tons in 1942 and 4,154,000 tons in 1941. (S. O. R.)

Cornell University.

An institution of higher learning, nonsectarian and co-educational, at Ithaca, N.Y., founded in 1865 and incorporated as a land-grant college under the Morrill act of 1862.

The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law and medicine (located in New York city and operated in conjunction with the New York hospital), and the state-supported colleges of agriculture, home economics and veterinary medicine. Two experiment stations, at Geneva and Farmingdale, N.Y., are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school.

Early in the academic year 1941–42 there was established school of nutrition, offering a five-year program leading to t M.S. degree. Special wartime developments were the establis ment of a naval training school with an enrolment of 1, officers; and a great expansion in engineering, science, manag ment war training courses offered under the sponsorship of t U.S. office of education. Additions to plant included Olin hall chemical engineering and the high-voltage laboratory of the en neering college. For statistics of the faculty, student enrolme library, endowment, etc., *see* Universities and Colleges. Pre dent, Edmund Ezra Day, Ph.D., LL.D. (E. E. D.)

Cornhusking.

The national and most state cornhusking cha pionships were cancelled because of the w and cornhusking became a project in which many townspeo participated in an effort to harvest the crops for the farme Besides the nationals, state contests were cancelled in Iowa, N braska, South Dakota, Wisconsin, Minnesota, Kansas, Missou Illinois, Indiana, Ohio and Pennsylvania. Floyd Wise of Prai Center, Ill., the 1941 champion, was in the U.S. armed forc during 1942. (M. P. W.)

Corporation Income Tax: *see* Taxation.

Corrigan, Joseph Moran

(1879–1942), U.S. clergyma was born May 18 in Philad phia. He attended Overbrook seminary and received his S.T. degree from the Pontifical College of North America in Rom He was ordained priest in Rome in 1903 and was assigned to Philadelphia church, where he was active in settlement work. was made chancellor of the archdiocese of Philadelphia in 19 prelate of the papal household, 1929, and apostolic protonotary 1937. He was consecrated titular bishop of Bilta in 1940. A lea ing Catholic educator, Bishop Corrigan was rector of the Catho University of America, Washington, D.C., 1936–42. He died Washington, June 9.

Costa Rica.

A republic of Central America. Area, 23,0 sq.mi.; pop. (1941 est.) 668,800. More th three-fourths of the predominantly white population live in t west central highlands; an estimated 3% who are Negroes li in the coastal area, where banana production is importa Capital, San José (78,000). Other cities: Heredia (9,000 Alajuela (8,000); Puerto Limón (8,600); Cartago (8,20 Language: Spanish. President in 1942: Rafael Angel Calder Guardia.

History.—During 1942 Costa Rica continued its policy of e thusiastic co-operation with the United States and the allies. C Jan. 30 the joint declaration of the United Nations was approve and in May diplomatic relations were ended with Hungary a Rumania. The sinking of a vessel within the harbour of Puer Limón by a submarine presumably German caused anti-axis ric and the arrest of suspected persons.

The national emergency brought about a suspension on Mar 5 of the constitutional guarantees for a 60-day period and t state of siege was further extended in June. A National Civili Defense board was early put in charge of defense preparation and problems connected with price and supply of commoditi resulted in the establishment of an Office of Price Investigati and Control on March 27. Under the direction of this authori the re-export of manufactured articles was prohibited and ewise took over the regulation of price and production of such ms as drugs, livestock, metals, oils and fats, corn, beans and e. Fear of a misuse of United States currency by axis agents ulted in the prohibition of both import and export of such rency, and the National Bank of Costa Rica took over superion of all foreign exchange.

Efforts to increase production of rubber and abacá were backed government interests and the fruit corporations, both to courage production of strategic materials and to substitute for 30% loss in revenue caused by reduction of banana exports. ring 1942 the cost of living steadily increased.

Education.—The school system is excellent (671 schools, 594 students in 1941), and the literacy rate (76%) the best in ntral America.

Defense.—In normal times the Costa Rican army is limited to ; in war approx. 50,000 men on the army rolls are available service.

Finance.—The monetary unit is the colón, valued at 17¾ cents S. in 1942. Finances for 1941 indicated revenue: 42,611,000 ones; expenditures: 53,036,000 colones. Notes in circulation 941) were 66,900,000 colones. A bond issue of 1,000,000 ones was authorized in Nov. 1942.

Trade.—Total trade (1941): $27,807,453, up 14% from 1941. ports: $17,754,186; exports: $10,053,257. The U.S. took proximately 80% of all trade. Trade for 1942 declined in antity, banana exports suffering most.

Communication.—External communication by water was tailed by the war, with fruit company boats diverted to other es. Air service increased in 1942, with a new line to Panama thorized. Pioneer roads to connect unfinished portions of the ter-American highway were under construction.

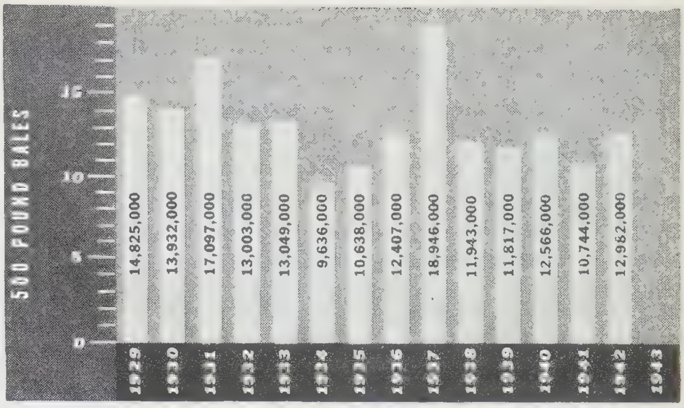
otton.

Cotton Manufacture.—Cotton consumption in 1942 set an all-time high record, with an increase of apoximately 10% over 1941, in which year it passed the 10,000,- bale mark. That this apparently impossible task was accomshed was due primarily to the addition of looms from other nches of the industry to cotton manufacture.

The most conspicuous case was in connection with cotton duck. ght after Pearl Harbor it looked as if the military requirements duck could not possibly be met; the figure was too fantastic. thin a few weeks after the outbreak of the war, however, exng duck manufacturers were bending their energies teaching rpet manufacturers how to convert their looms, rendered uses for their ordinary purpose by shortage of wool, to the proction of cotton duck. So successful was this conversion that fore the end of 1942 not only was the production of duck adeate for the enormous demands, both from the army and from lustry, but the converted plants were producing 38% of the al output of the country.

Another serious bottleneck which threatened the defense and n the war program was in combed yarns. Specified by the artermaster corps for many uses which had hitherto been filled carded yarns, combed yarns became one of the tightest spots the industry. In Aug. 1940 (just prior to the real start of the fense demands for combed yarn) weekly production of combed rn by the member mills of the Southern Combed Yarn Spinrs association averaged 2,008,679 lb. In Aug. 1941 (after one ar's conversion effort) the same spindles averaged a weekly oduction of 3,224,554 lb. of which approximately 45% was going into government work. In May 1942 the same spindles were producing a weekly average of 4,091,618 lb., of which 2,500,000 lb. (or 61%) were being shipped on government work. In other words, in 20 months the same spindles had voluntarily doubled their production capacity and at the end of that period shipments to the government were 125% of normal weekly output.



COTTON CROP in the United States. The figure for 1942 is the department of agriculture's estimate of Dec. 1

Another job done by the cotton industry to meet the war emergency was the conversion of looms previously operating on apparel and household fabrics to the production of bag fabrics, to meet the tremendous demand for sandbags, camouflage cloth, food and agricultural bagging, to fill the gap caused by the interruption of burlap imports. A conversion order was issued for the purpose of raising the annual production rate of osnaburg from 263,500,000 yd. to 660,000,000 yd. and bag sheeting from a rate of 488,000,000 yd. to 855,000,000 yd. The result of this order, and of the military schedules already in effect, was to put the cotton weaving industry about 88% into war, essential industrial and essential civilian production.

The Tire Problem.—Of the many emergencies with which the cotton industry was concerned, none came nearer to home to the average citizen than the tire shortage. Two separate developments, but each involving the use of cotton fabric, pointed toward possible relief through protection of the precious tires still in use. One of these, called a "sandal," was developed jointly by a textile manufacturer and a rubber company, and was made of cotton pile fabric, somewhat resembling a closely stitched bathmat or rug. The "sandals" would be wrapped around tires, with "ears" tucked in between tire and rim. Tests indicated that these "sandals" would give from 2,500 to 3,000 mi. of additional life to tires.

The other development was a "girdle" developed by another rubber company and designed as a protector for the inner tube, by insulating and protecting the tube against the chafing action of broken or otherwise damaged inside plies in the cord body of the tire. The "girdle" was made of cotton cord, contained no rubber, and was shaped in a full circle to fit snugly and neatly around the tube.

At the beginning of 1943 neither of these had reached a commercial stage.

Still another development in the tire field was the new competition from synthetics. In the fall of 1942, the War Production board, with the approval of the army, ordered conversion of viscose rayon facilities to produce an additional 50,000,000 lb. of high-tenacity rayon per year, to be used in aeroplane and special duty truck tires. This precipitated a battle royal between the rayon interests and the cotton manufacturers as to the relative merits of the two for performance in high-duty tires. (*See* also

COTTON replaced silk and wool and other scarce dress materials in U.S. fashions during 1942

Agriculture; Linen and Flax; Rayon; Textile Industry; Wool.) (D. G. Wo.)

Cotton Production.—Returns to planters from marketings of the 1942 cotton crop of the United States, up to mid-Dec. 1942, averaged $63.32 per ac. This was an increase of 27.3% over 1941 and the second highest per-acre return on record. The peak was $69.25 in 1919. If government payments to farmers is added to cash price received, the total per-acre return on the 1942 crop averaged $66.80.

The 1942 cotton crop was estimated by the U.S. department of agriculture at 12,982,000 bales, 500 lb. gross to the bale. Th 1941 crop was 10,744,000 bales. The area planted in 1942 wa 23,310,000 ac., but 650,000 ac. were abandoned. The area ha vested, 22,660,000 ac., produced the highest per-acre yield o record, 275.1 lb. per ac. The yield in 1941 was 231.9 lb. per a For 1943 the department of agriculture asked farmers to reduc planting by 810,000 ac.; that is, the 1943 acreage quota to b planted was placed at 22,500,000 ac. as compared with plantin of 23,310,000 ac. in 1941.

U.S. Production of Cotton by States, 1942 and 1941

State	1942 bales	1941 bales
Texas	3,833,000	3,370,000
Mississippi	1,975,000	1,424,000
Arkansas	1,495,000	1,430,000

In announcing 1943 plans at a meeting of cotton growers i Memphis, Tenn., Secretary Wickard urged that farmers plan more long-staple varieties and less short-staple cotton. The Unite States had on hand in 1942 almost a two-year supply of shor staple cotton (staple under one inch). "Production of shor staple cotton," he declared, "would not count toward defermen of military service." Growing of short-staple cotton had been reduced steadily for 15 years or more, but the need continued fo a larger proportion of long- and medium-staple cotton. In the n years from 1928 to 1937, which is the earliest period such record were kept, short-staple constituted a percentage of the crop ranging from a high of 78.6% to 57%. It was 40.1% in 1940 an 37.7% in 1941. Through Dec. 12, 1942, at which time 11,742,79 bales of the 1942 crop had been ginned, the percentage of sho staple was 37.6. It was urged that the 1943 acreage withdraw from cotton planting be planted to peanuts, soybeans or fee crops, and also that those farmers who raised short-staple cotto should shift to long- or medium-staple or to soybeans, peanuts o feed crops. The farm price for cotton advanced to 19.55 in De 1942, the highest since 1928.

Japan.—The U.S. department of agriculture is authority for report that Japanese officials had announced a five-year (1942 46) plan for developing the Philippine islands, which plan include increasing production of cotton in the Philippines to 415,000 bale a year. Japan is one of the largest manufacturers of cotton clot and before World War II was, with Great Britain, the Unite States' best customer for cotton. In 1940 Japan bought 941,00 bales of United States cotton, compared with 2,007,000 bale bought by Great Britain, 773,000 by France, 577,000 by Ital 432,000 by Canada, 422,000 by China and 20,000 by German But in 1939 Japan bought 896,000 bales of United States cotto while Great Britain bought only 421,000 bales, France 362,00 Germany 345,000, Italy 292,000, Canada 238,000 and China 87 000. The Japanese plan in the Philippines was reported to propose inducing Philippine farmers to divert 1,000,000 ac., chiefl sugar and tobacco land, to cotton and to colonize the sparsel settled areas of Mindanao with Japanese who would grow cotto The Philippines produced very little cotton, an inconsequentia production running about 600 bales a year. American representatives and Philippine officials who investigated Philippine possibil ties in cotton reported conditions that indicated the Philippine were adaptable to the production of about 10% or 15% of th quantity of cotton called for in the Japanese plan. Japan ha tried to develop, with indifferent results, cotton-growing in Chose by offering subsidies to farmers.

Brazil.—Drought delayed cotton planting in Brazil four to si weeks in 1942 and compelled some replanting during the plantin season which is normally September to November. Shortage o gasoline for tractors and trucks also added to difficulties of putting in the new crop. Official forecasts were that the 1943 cotto crop in Brazil would approximate 362,000 bales, as compared wit 744,000 bales picked in 1942.

Egypt.—The first official estimate of the 1942 cotton crop i Egypt was 725,000 bales of 478 lb. to the bale. The 1941 cro was 1,735,000 bales. The Egyptian government has for severa years been granting subsidies to farmers to divert cotton land t production of food crops, and rigidly restricted the acreage 1942, Egypt's normal market for cotton, Great Britain, having n severely limited by the war.

ran also reported a smaller crop, 120,000 bales in 1942 and ,500 in 1941. World production figures on cotton were fragntary in 1942 and there was only a narrowly limited interional trade in the staple because of the war. As a result exting countries further increased the mounting carry-over of ton which, unlike most food crops, can be stored indefinitely hout material loss.

erar, Henry Duncan Graham (1888–), Canadian army officer, was n April 28 in Hamilton, Ont. Educated at Upper Canada cole and the Royal Military college, Kingston, he was commisned as a lieutenant in 1910. He served in France during World r I, advancing to the rank of lieutenant colonel. After the , he became a general staff officer attached to the British war ce, 1925. An expert on strategy, he later became director of itary operations and intelligence in the department of national ense. After the outbreak of World War II, he went overseas h the rank of a brigadier and, in 1940, he was promoted to jor general. He was subsequently appointed lieutenant general, he voluntarily stepped down to major general in order to e a combat command as head of a Canadian division in Britain. n. Crerar took acting command of the entire Canadian corps Dec. 26, 1941. After Gen. Andrew McNaughton resumed nmand of the First Canadian army on April 6, 1942, Gen. erar was confirmed in his post as corps commander.

ews, Laura Hope (1880–1942), U.S. actress, was born in San Francisco. Daughter of a uper, she was a stage veteran at the age of 18. Her career was errupted for a short two-year period when she attended State rmal school, San José, Calif., in an attempt to satisfy a childod longing to be a school teacher. But she returned to the atre in 1898, playing ingénue roles in a San Francisco stock mpany. She progressed to more important roles, appeared with n Drew and Sir Herbert Beerbohm Tree in Shakespearean ertory in London and solidly established herself as one of the ter U.S. actresses with her excellent performance in *The Silver rd* (1926), in New York. When nearly 50, she made her first pearance in motion pictures and rapidly won fame for her ewd and humourous portrayals of vacuous social butterflies. r last appearance on the stage was in *Arsenic and Old Lace,* she was forced to drop out because of illness a month before death in New York city, Nov. 13.

icket. The circumstances of war—no county championship, no tests, restricted trains, disappearing gasoline, indling supply of bats and balls—only served to make cricketers in England keener than ever. In 1940, 52,555 persons watched cricket at Lord's, headquarters of the game. In 1942, the number rose to 89,612. Club cricket, too, flourished, matches against teams from the armed forces in the neighbourhood replacing those against wandering clubs. Among schoolboys, the England players of the future, the game was more popular than ever.

In June, at Lord's, the royal air force (243 for 3 wickets, C. Washbrook, Lancashire, 102) beat the army (242, S. C. Griffith, Sussex, 81). The army won the second match, and the third was left drawn, fine batting being shown by C. B. Harris, of the army and Nottinghamshire, young Denis Compton, army and England cricketer and soccer-player, and Leslie Ames (R.A.F.), England's famous wicketkeeper-batsman.

Cambridge beat Oxford in a one-day match at Lord's, the last Oxford man, their captain, W. J. C. Butterfield, being bowled by the last but one ball of the day. Eton easily beat Harrow at Harrow. The outstanding school players were T. E. Bailey and A. W. H. Mallett of Dulwich, where C. S. Marriott, the old Kent and England slow bowler, was coach. Mallett hit a ball to leg over the main grandstand at Lord's, a huge blow for a boy of 17.

Sunday afternoon cricket was regularly played at Hove, headquarters of the Sussex Club, with no charge for admission; and Major Maurice Tate, one of the greatest of past England bowlers, at the age of 46, twice bowled there unrelieved for two hours.

On July 11 the army beat the navy, far from fully represented, at Lord's. For the army, Lieutenant J. D. Robertson, of Middlesex, a probable post-war test player, made a brilliant 109. On August Bank Holiday, a two-day match was staged at Lord's, Middlesex and Essex versus Surrey and Kent. Major E. R. T. Holmes, former Surrey captain and England batsman, came out after illness with a grand 114 not out. The match was drawn.

Sir Pelham Warner, former England captain and test selection chairman, in his 70th year and in spite of poor health, performed wonders of organization as war-time secretary of the M.C.C. (Marylebone Cricket Club).

(R. C. R-G.)

Crime. **United States.**—The first six months of 1942 were marked by a 1.7% increase in the number of crimes committed in American cities. As compared with the corresponding period of 1941, rape increased 9.9%; negligent manslaughter 9.4%; robbery 5.2%; aggravated assault 4.7% and larceny 4.2%. Three classes of reportable offenses declined in number: burglaries dropped by 4.3%, auto theft by 1.6% and murder by only 0.2%.

Table I shows for comparable periods of 1941 and 1942, the total of each class of reportable crime in 337 cities over 25,000 population.

Despite the general upward swing, it is to be noted that in those categories showing increases, the rise was less pronounced in the second quarter of 1942 than in the first quarter. Similarly, those crimes showing declines in the first quarter tended to strengthen this tendency during the second quarter of 1942. Hence the record for the entire year might reflect a much more favourable trend in 1942 than is here portrayed.

Crime in Cities, Towns and Villages.—The broadest base for data on the number of criminal acts committed in urban communities appears in *Uniform Crime Reports* in its 13th year in 1942. For the first half of 1942 it covered 2,074 cities, towns and villages having a total population of 63,231,588. In this large and representative group, the generally rising trend of crime during the latter part of the 1930–40 decade was projected into the 1940s and at least to the midyear point of 1942, though there were still many shifts and changes of direction as to particular classes of crimes. Most consistent in this rising trend were rape and aggravated assault, both of which, it will be noted, are crimes against the person.

The geographic distribution of crime continued in 1942 to display wide regional inequalities similar to those reported for preceding years. As indicated in Table II, the northeastern states generally enjoy the most favourable records.

Distribution of crimes according to the size of the community in which the offenses were committed is presented for the first six months of 1942 in Table III. As in previous years, the higher crime rates tend to cluster in the larger cities. Comparing the 1942 record with that for 1941, almost identical patterns appear. In both of these years Group I cities (over 250,000 population) had the highest rates for rape and robbery, Group II cities (100,000 to 250,000 population) led the field in negligent manslaughter, burglary, larceny and auto theft, with Group III cities (50,000 to 100,000) showing the highest rates for aggravated assault. In only one respect was the 1942 pattern notably different from that of 1941; in the latter year Group III cities had the highest rates for murder and non-negligent manslaughter, whereas in 1942, these allied crimes were most numerous in Group II cities. Viewing the trend of these distributions it is apparent that the Grou II cities were gradually, but none the less surely, displa ing Group I cities from first place in the matter of high crim rates.

Table I.—*Crimes in 1941 and 1942*
(In 337 U.S. Cities of over 25,000 population.)

Offense	January to March		April to June		January to June	
	1941	1942	1941	1942	1941	1942
Murder and Non-Negligent Manslaughter	661	634	698	722	1,359	1,356

*Based on reports from 336 cities.

Table II.—*Regional Distribution of Crime, January to June, 1942*
(Number per 100,000 inhabitants)

	Murder and Non-Negligent Manslaughter	Robbery	Aggravated Assault	Burglary—Breaking or Entering	Larceny—Theft	Auto Theft.
New England	0.59	6.1	4.7	124.4	295.9	87.2
Middle Atlantic	1.45	11.9	15.4	104.7	235.3	67.0
East North Central	2.07	39.8	18.0	155.2	425.2	66.5
West North Central	1.57	12.1	14.0	112.6	403.8	60.5
South Atlantic	7.24	33.0	84.0	193.1	669.7	126.5
East South Central	8.65	44.4	76.9	219.1	595.7	107.0
West South Central	5.97	25.5	48.7	194.8	709.1	88.0
Mountain	1.71	29.2	12.3	215.0	741.8	94.6
Pacific	1.89	34.7	15.2	226.1	741.9	178.6

Relative frequency of the various reportable offenses, durir the first six months of 1942, showed larceny with 60.8% of t total; burglary 20.4%; auto theft 11.2%; and robbery 3.2 These crimes against the person together accounted for 95.6% all reportable classes, with only 4.4% of the grand total distri uted among crimes against the person (homicide, rape and a gravated assault). Especially notable was the fact that the re tive frequency of larceny showed an increase in 1942, as it had each of the preceding years beginning with 1937. The relati frequency of robbery showed a very slight increase for 19 (3.2% versus 3.1%), though in preceding years since 1937, it h shown relative declines. Auto Theft	98.9	109.0	84.4	76.7	60.3	46.6	86.

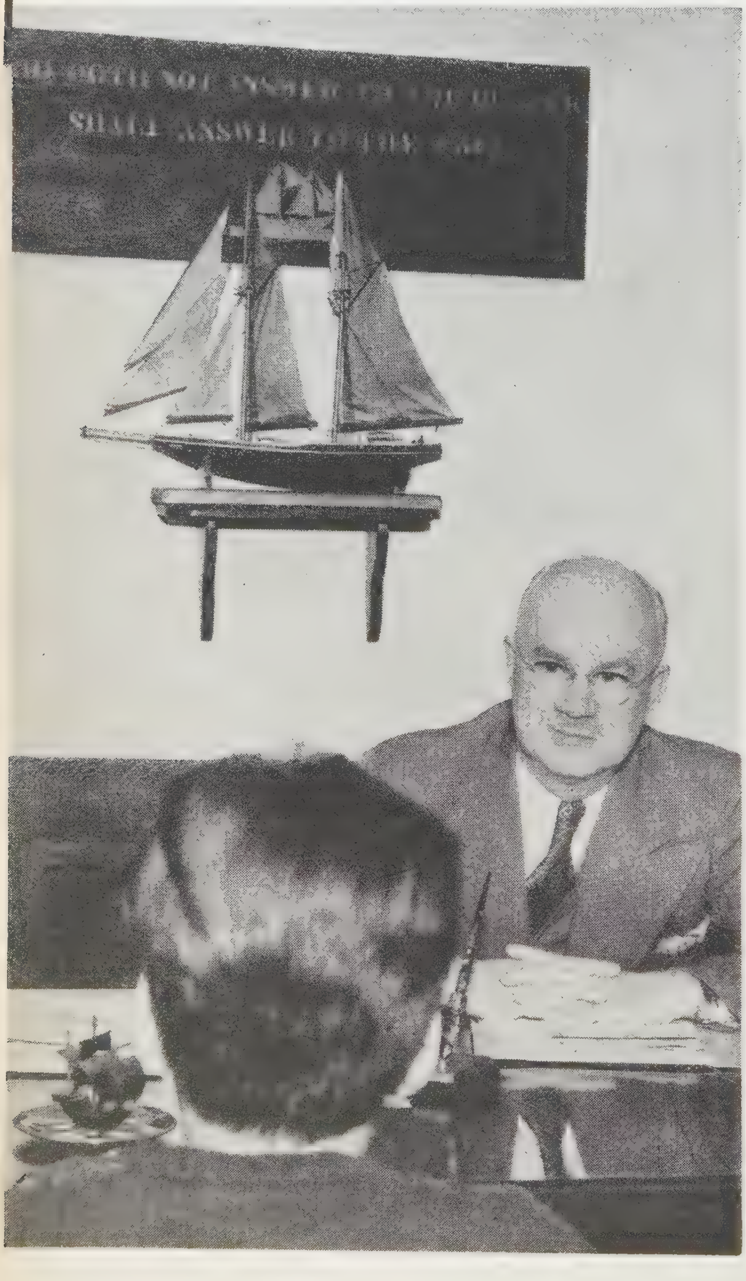
BIBLIOGRAPHY.—*Uniform Crime Reports* (quarterly) for 1941, and the first half of 1942 (Federal Bureau of Investigation, Washington, D.C *Judicial Criminal Statistics, 1940* (U.S. Bureau of the Census, 1942); P



THE CRIME RATE among U.S. youths increased by an estimated 20% in 19 chiefly because of the war. One of the most effective combating agencies the enlightened juvenile court, typified by the Child Study institute of Tole Ohio. The judge of Toledo's juvenile court, Paul Alexander, is shown here in viewing a young offender ners in State and Federal Prisons and Reformatories, 1939* (U.S. Bureau of he Census, 1941); Thorsten Sellin, *War and Crime: A Research Memoran-um* (Social Science Research Council, 1942). (Br. S.)

Great Britain.—Although no complete official statistics subse-uent to 1938 were available, it is possible to indicate the gen-ral tendencies in certain types of crime. The habitual criminals ere much less in evidence; they could be readily absorbed into he services or employment so that the problem of a workless uture for these men no longer existed. On the other hand, the ar encouraged many classes of new offenders. The postmaster eneral expressed his grave concern about the heavy losses of ostal packets, and supervision at railway stations and other laces was tightened in an attempt to combat the evil. The black-ut greatly facilitated this and other kinds of theft: there were any cases of bag-snatching from women in the darkened streets nd it was comparatively simple for large scale robberies to be ade from warehouses and shop premises during the night. The ear's figures for larceny from shops and stalls, however, showed general drop of about 30% as compared with 1938.

"Black market" activities continued to maintain a high level. he abnormal conditions offered plentiful opportunities for of-enses against the Food acts and board of trade regulations. The inistry of food reported an increase in prosecutions for 1941 of early 300% over the previous year. The figures for 1942 showed further jump of 10%, the total to the end of October being 5,450. Among the huge number of firms engaged on government ontracts there were, similarly, some who took advantage of the tuation to indulge in frauds and false pretenses, in some cases volving very considerable sums of money.

A big-scale traffic in identity cards was disclosed following a mpaign to round up deserters and others contravening the Mili-ry Service acts and National Service regulations and heavy enalties were being inflicted in order to stamp it out.

Motoring offenses were down by about 60% over 1941, but this as obviously accounted for by the motoring restrictions which ad reduced road traffic to a very great extent.

A disturbing increase in juvenile delinquency was attributed to ck of parental control (the fathers serving in the forces or in nployment away from their homes, the mothers in many cases eing engaged on war work) and to the fact of a large number of hools in danger areas having been closed during the period of eavy bombing raids in 1940 and 1941. (*See* also Prisons.)

ripps, Sir (Richard) Stafford

(1889–), British politician and wyer, was born April 24 and was educated at Winchester and niversity college, London. Called to the bar in 1913, he became King's counsel in 1927. He first entered parliament in 1931 as Labour member for East Bristol, having been appointed solici-or-general in the MacDonald cabinet. Later he was a leader of e opposition to the National government formed in 1931, but mporarily parted ways with the other Labour leaders, whose ews he considered too conservative. He was an ardent champion a "united front" with the Communist party.

He was sent in May 1940 to negotiate a trade agreement with e soviet union, but was appointed ambassador while still en ute for Moscow. In this capacity he signed the Anglo-Soviet act of mutual assistance. He relinquished his appointment in an. 1942, and in February was made Lord Privy Seal and leader the house of commons, with a seat in the war cabinet. In arch he volunteered to go to India to try and negotiate an greement between the two countries and was sent out by the overnment with proposals for granting India her independence at e end of the war. He remained in India for three weeks, had iscussions with representatives of all parties, but failed to reach an agreement and returned to London in April. (*See* also India.) In Nov. 1942 he relinquished his seat in the war cabinet to undertake the ministry of aircraft production.

Croatia.

A kingdom formed from former Yugoslavia in the northwestern part of the Balkan peninsula under the impact of German aggression in April 1941. Separatist Croats of the fascist terrorist organization "Ustasha" set up in Zagreb an independent Croat regime with Dr. Ante Pavelitch as fuehrer, or "Poglavnik," and with Marshal Sladko Kvaternik as minister of war. The new state, organized on strictly fascist and authoritarian lines, excelled quickly by the special ruthlessness and cruelty with which it persecuted, and partly exterminated, the large Serb minority and the small Jewish population. On May 17, 1941, the Italian prince Aimone became King Aimone I, yet up to the end of 1942 he had not dared to set foot on the soil of his new kingdom. The permanent disorders and acts of violence in which the discontent of the people expressed itself did not allow a pacification of the country in spite of Italian military occupation.

Croatia has an area of 115,135 sq.km. with about 7,000,000 inhabitants, of whom about 5,000,000 are Catholic Croats. The Mohammedan minority in Bosnia enjoys a privileged position. Their representative, Kulenovitch, was vice-premier in 1942. At the end of Feb. 1942, the Croatian diet, or Sabor, met. In his report the foreign minister, Lorkovitch, declared that Croatia formed the bulwark of occidental civilization against the east and that her foreign policy was firmly founded on the alliance with Italy and friendship with Germany and her membership in the axis.

The most important party in Croatia before 1941 had been the Croat peasant party, which represented the vast majority of the people, under the leadership of Dr. Matchek. After the creation of fascist Croatia, Dr. Matchek had been kept under arrest, but he was released in 1942 and was allowed to return to his farm at Kupinec. Reliable sources reported in October that Marshal Kvaternik had been removed from his position in the cabinet and imprisoned. Premier Pavelitch took over the war ministry and dismissed the chief of staff, General Laxa. Kvaternik's son Eugen, one of the leading terrorists of the Ustasha and police chief of Zagreb, was also removed from office, and all three were accused of graft in army transactions. Yet it was more probable that their dismissal was a result of internal party conflicts. The members of the Orthodox church living in Croatia were organized into an independent church no longer under the jurisdiction of the head of the Serb church.

Peace in Croatia was disturbed again and again by violent internal conflicts. General Mikhailovitch's army and the independent partisan bands extended during the year their operations deep into Croatia. They were supported by parts of the Serb population of Croatia and by many Croatian peasants. The fighting was especially violent in Bosnia, but it was carried even into the vicinity of Zagreb. The cruelty and lawlessness of the Ustasha provoked bitter resentment among the population and brought many recruits to the patriot and partisan armies. The newly formed Croatian army, a small part of which was fighting in the soviet union on the side of the Germans, was entirely unable to cope with the violent internal disorders, which often assumed the character of open, organized warfare. The Italian army of occupation was especially engaged in combatting the patriot army and the uprisings, but the actions of the enemies of the Croatian regime were often accompanied with success, and the Italian losses were reportedly large. Cruze, James (JAMES CRUZE BOSEN) (1884–1942), U.S. motion picture director and actor, was born in Ogden, Utah, one of 23 children of Mormon parents. An actor in the cinema's infancy, he starred with Pearl White in serial thrillers. He later turned to directing pictures and among his early achievements were *Old Ironsides, The Covered Wagon* and *Merton of the Movies.* With the advent of the talking pictures, Cruze directed many box-office successes, including *Ruggles of Red Gap,* and *Beggar on Horseback.* At the height of his career, he was one of the best-paid and most skilful of Hollywood's directors. He died in Hollywood, Calif., Aug. 3.

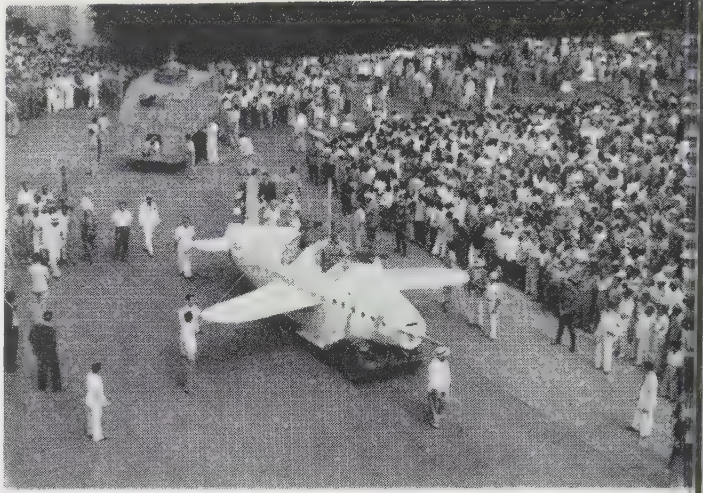
Cryolite. After the occupation of Denmark by Germany and of Greenland by the United States there was no information on cryolite beyond the fact that imports into the United States declined from 25,858 long tons in 1940 to 13,329 tons in the first nine months of 1941, but the ships carrying supplies to the United States troops in Greenland should be able to bring back at least a reasonable supply of cryolite, as this is practically the only product available for export. (G. A. Ro.)

Cuba. A republic occupying the largest of the West Indian islands; area, 44,164 sq.mi., including dependent islands; pop. (unofficial 1942 est.) 4,420,700. Capital, Havana (pop. 1938) 568,913. Other large cities are Camagüey (138,295); Santiago (107,125); Santa Clara (99,509); Cienfuegos (92,258). President in 1942: Fulgencio Batista.

History.—Internal politics in Cuba in 1942 were not marked by any serious upheavals, although there were rumours that a coup d'état had been attempted on July 4. The congressional elections in March returned a comfortable majority for the administration's Democratic party; the membership of the Cuban congress, incidentally, was reduced to 138 because of constitutional changes on representation. The cabinet was reshuffled during the year in June and August; it remained largely Democratic although in August, in a "national unity" cabinet, somewhat wider representation to opposition parties was given. One woman, Dr. María Gómez Carbonell, was appointed to the cabinet in June, the first woman to hold such a post. Opposition groups in general did not condemn Pres. Batista's foreign policies but occasionally voiced criticism of method. In July Col. José Pedraza, who had gone into political exile the previous year, was allowed to return.

The Cuban attitude toward Spain remained unfavourable (feeling had been aroused after Dec. 7, 1941, by Spanish pro-fascist propaganda). The Spanish embassy was forbidden the use of code in cable and radio messages because of the feeling that this might facilitate axis activities. Shipment of foodstuffs of all kinds to Spain was forbidden, and a ban was placed on the provisioning of Spanish ships in Cuban ports. The former Spanish representative to Panama, Count Carlos de Bailen, who had been invited to leave that republic because of pro-fascist utterances, was arrested in Cuba and later deported. One nazi spy was captured and sentenced to death in September. Cuba also severed relations with the Vichy French government on Nov. 10, and French funds and goods were frozen by executive order. On th other hand, recognition was accorded the U.S.S.R. on Oct. 11 the soviet ambassador to the United States, Maxim Litvinov was subsequently accredited to Cuba also.



CUBA'S MAY DAY CELEBRATION in 1942 featured a parade of military float and demonstrations against the axis

In December Pres. Batista followed the example of other Latin American presidents and made a visit to Washington. Result were not immediately disclosed, but undoubtedly conversation concerned the purchase of Cuba's 1943 sugar crop, and prioritie for irrigation and refrigeration machinery urgently needed for th Cuban plan to grow more foodstuffs.

Cuba continued to co-operate heartily in hemisphere defense The United States air forces were allowed the use of Cuban fields; a military agreement between the two countries was signed in Sept. further integrating their war effort. Cuba also signed on Oct. 3, a mutual defense pact with Mexico by which join use of facilities was pledged to combat axis submarines in th Caribbean sea and Gulf of Mexico. Control of the movemen of United States currency (difficult where so much was in circulation) was started in June in accordance with general American policy. In spite of an active defense program, United State Ambassador Spruille Braden stated that he was sure that remot spots on Cuba's extensive coast line were being utilized as secre submarine bases.

The Cuban army was greatly strengthened during 1942. At firs augmented on a volunteer basis, it was later decided to institut compulsory military service, and 400,000 Cubans between th ages 18–50 started registration on Aug. 1. Appropriations fo defense were increased to meet new needs, and some air an naval officers were sent to the United States for training. Th usual civilian defense organizations were established, and th government took over news censorship in April, and also ma censorship. In July a Cuban maritime commission was created and in Aug. a census of all boats more than 20 ft. in lengt was ordered.

In the economic field, sweeping powers were granted to th president by an order issued Jan. 21. This placed under hi authority all mineral, agricultural and industrial production, control of imports and exports, arbitration of labour disputes, th right to fix prices and quotas, and to expropriate property of a kinds where necessary for the national defense. The 1942 budge was finally adjusted at more than $89,000,000, an increase c $10,000,000 over 1941. In the early months of the year there wa a shortage of circulating media, and currency had to be imported from the United States. Extensive loans were also mad for various purposes, and a special session of congress was calle in June to consider the founding of a Cuban central bank to ai a financial operations.

In general Cuba was hard hit by the war, largely because of erious shipping shortages. Scarcities resulted in almost every spect of Cuban life—in transportation, with rubber, automobiles, nd gasoline and fuel oils; in power for lighting, and in building aterials and items used in Cuban industry; and finally in foodtuffs, with rice, vegetable oils and lard, and notably meat, lackg. The tourist trade, normally a $12,000,000 industry, had most vanished. Various commissions were created to cope with e problem, and an extensive rationing program was launched. leat exportation was completely halted in April. Reports during e summer indicated that price stabilization and rationing were oorly enforced, however.

Rising costs in living and unemployment caused much concern. Vages on sugar plantations were raised 50% in the spring, and overnment employees had theirs increased 10% to 20%. In pril a law was passed which forbade the eviction of tenants om farms, and a minimum price was set to protect Cuban bacco growers.

Sugar, the backbone of Cuban economy, was in demand but as affected by lack of cargo space. The United States contracted take the entire 1942 crop (some 4,000,000 tons), but by ug. had yet to move 1,700,000 tons.

Education.—In the 1943 budget, education was allotted 17,- 0,000 pesos, a 700,000 peso increase over the 1942 estimate. imary schools: approx. 5,000, with an enrolment of 500,000.

Defense.—Military service was placed on a compulsory basis ug. 1, 1942, avowedly for duty only in Cuba. Estimated army rength: 35,000–40,000.

Finance.—The Cuban monetary unit is the peso, officially ual to the U.S. dollar; shortage of circulating media caused e peso to sell at a premium in the early months of 1942. evenue for the period Jan. 1–Dec. 5, 1942, was 89,608,000 sos; expenditures: 95,330,000 pesos (1941 rev.: 75,945,000 sos; exp.: 77,549,000 pesos). The budget for 1943 presumably lanced revenues and expenditures at 89,993,595 pesos. The pub- debt (June 30, 1942) was 120,995,000 pesos (external: 113,- 8,000; internal: 7,367,000).

Trade.—The foreign trade for Cuba for 1941 amounted to 45,397,728 (imports: $133,890,137; exports: $211,507,591). Of imports, 87.5% were from the U.S.; 85.6% of all exports nt to the U.S.

Communication.—Transportation by sea to Cuba was affected the war; air services by Pan American Airways increased. e new shipping service with Canada was announced. The uban government had under consideration a plan to build in uba a number of smaller wooden vessels to aid in sugar transrtation. Lack of motor fuels affected local transportation; 500 ses were removed from service in Havana alone. A registration radios listed 349 radio telegraph and telephone stations in rvice (Jan. 1942). The railway system was 3,850 mi. in length 1942, and 2,500 mi. of highway supplied internal communican; $5,000,000 of a larger Export-Import Bank loan was earrked in 1942 for further highway construction.

Agriculture.—The greatest Cuban crop is sugar (with derivaes, three-fourths to four-fifths of total exports). The 1942 op was first set at 3,600,000 long tons, but quotas were later sed and the total production was estimated at 4,000.000 tons. e entire crop was sold to the U.S. with the exception of 200,000 ns retained for domestic use. Price per lb. averaged 2.65 cents. ntative estimate for the 1943 crop was 3,000,000 tons. Tobacco ports for 1941 were valued at $1,137,316. The government anned extensive production of peanuts, sisal and oil-bearing eds, but found it difficult to secure tools and machinery.

Mining.—Mineral production in Cuba was of growing significance. Export values for the first half of 1941 were: copper $751,874; iron $57,212; barytes $141,608; gold $455,943; manganese $2,801,133; silica $77,700. It was estimated that production for 1942 would be 40% higher. U.S. loans (through the Defense Plant Corp. and the Metals Reserve Co. to the Nicaro Nickel Co.) amounted in Aug. to $20,000,000 for development of a new supply of nickel. (*See* also WEST INDIES.)

(D. RD.)

Cunningham, Sir Andrew Browne (1883–), British naval officer, commander of the British Mediterranean fleet after 1939, was born in Bishop's Waltham, Hants., England. He entered the royal navy in 1898. During World War I, Sir Andrew commanded the destroyer "Scorpion" and staged daring raids against enemy shipping in the Mediterranean. He was a rear admiral in 1933–36, and was made a vice-admiral commanding a battle cruiser squadron in 1937. He was also lord commissioner of the admiralty and deputy chief of the naval staff, 1938–39. In April 1940 Sir Andrew, aboard his flagship "Warspite," led a destroyer flotilla into Narvik fjord and sank seven German destroyers. Except for the Narvik battle, he had most of his naval experience in the Mediterranean, of which he is said to know every bay and inlet. In Nov. 1940 Sir Andrew's fleet raided the Italian naval base at Taranto, and crippled three Italian battleships. He commanded the victorious British fleet at the battle of Cape Matapan March 28, 1941. Sir Andrew was in command of the huge British naval force that convoyed U.S. and British troops to North Africa beach-heads on Nov. 8, 1942. His warships protected the ensuing landings with heavy bombardments.

Curaçao, a Netherlands Caribbean colony embracing the islands of Curaçao (210 sq.mi.), Bonaire (95 sq.mi.) and Aruba (69 sq.mi.) in the Leeward group off the Venezuela coast approximately 700 mi. air line from the Panama canal, and St. Eustatius (7 sq.mi.), Saba (.5 sq.mi.), and the southern part of St. Martins (17 sq.mi.) in the Windwards. Total area, 436 sq.mi.; pop. (1941 official est.) Curaçao colony 109,592; Curaçao island 68,217; Aruba 31,522; Bonaire 5,556; St. Martins 1,938; St. Eustatius 1,146; Saba 1,213. Religion: predominantly Roman Catholic; language, officially Dutch. The capital is Willemstad (pop. 30,453), on Curaçao. Government is in the hands of an appointed governor, and a majority-elected council. In Dec. 1942 a formal pledge of greater postwar autonomy was given by Queen Wilhelmina. Governor: Dr. Piet Kasteel (succeeded G. J. J. Wouters on July 16, 1942).

History.—Throughout 1942 Curaçao, as a major world oil-refining centre, continued to play an important war role. Curaçao and Aruba were both subjected to direct enemy attacks early in the year, and stringent defense precautions were maintained. The entire colony felt the pinch of shipping shortage as a result of submarine warfare in the Caribbean and of diversion of ships to war needs.

Education.—In 1938 there were 49 elementary schools with 11,044 enrolment.

Finance.—The monetary unit is the guilder (value approx. 53 cents U.S.).

Trade and Resources.—The backbone of the colony's economy is the refining of crude petroleum (primarily of Venezuelan origin) on Curaçao and Aruba, where two of the world's largest oil refineries are located. In peacetime this industry accounts for a full 99% of the colony's export values, with a single refinery employing over 5.000 persons.

GERMAN TORPEDO on the beach of Aruba in the Dutch West Indies after it had missed its mark during an attack by nazi submarines on the harbour of this important petroleum centre Feb. 16, 1942. Shortly after the photograph was taken the torpedo exploded, killing four men

Under war conditions statistics of petroleum trade and refining were not made public. In 1938, however, petroleum products accounted for 151,026,135 of a total of 153,026,135 guilders export values, and 138,740,326 of 179,945,850 guilders total import values. In 1940, exclusive of petroleum products (not reported), exports and imports were 14,278,385 and 27,459,989 guilders, respectively. Imports other than crude petroleum were foodstuffs, textiles, and other manufactured goods; the miscellaneous exports were largely items for re-export.

In the larger islands the principal resource of domestic origin is phosphate. Some cattle-raising and small agriculture is also carried on in Bonaire. Saba and the other islands of the Windward group are of negligible economic consequence, although they produce some fancy textiles and miscellaneous agricultural products.

Communication.—External and interisland communication is by steamer and small boat. Curaçao and Aruba have good air connections to the mainland and with the Pan American Airways hemisphere network. Both islands are important as refuelling centres for motor ships. In 1941, 10,177 ships touched at Curaçao and Aruba, compared with 8,871 in 1940. Curling.

Having become more of a national than an international event because of the war, 1942 curling witnessed the conquests of Schenectady, N.Y., in the Gordon Grand National and the New York City Caledonians in the Richard S. Emmet Memorial competition. The Royal Montreal rink, skipped by Willie Brown, featured Canadian curling.

Schenectady won its fourth straight Gordon Grand National in defeating Utica, 13–10, in the final. It marked the sixth time Bevis P. Coulson has skipped a rink to the Gordon medal. The Caledonians, led by William Cuthbertson, won the Emmet Memorial medal with an 18–7 victory over Winchester, Mass., in the final. Saranac Lake added further honours to New York curling by taking the W. Fred Allen Memorial medal under the leadership of Carl Hall. Saranac out-stoned Farmington, Conn., 20–19, in the final. (M. P. W.)

Currency: *see* COINAGE.

Currie, Lauchlin

(1902–), U.S. economist, was born Oct. 8 in West Dublin, Nova Scotia, and became a naturalized U.S. citizen in 1934. A graduate of the London School of Economics, 1925, he received his Ph.D. degree from Harvard, 1931. He left the Harvard faculty in 1934 to become senior analyst for the U.S. treasury and later was associated with the Federal Reserve board. In 1939, President Roosevelt made him his administrative assistant and counsel on economic affairs. In that capacity he made two trips to China, the first in 1941 to study Chungking's war needs with regard to securing lend-lease aid, and the second in July 1942, to consult with General Chiang Kai-shek on speeding U.S. war supplies to China's armies. During the latter trip, he assured Chiang that Washington would not let war operations in Europe prevent it from increasing the flow of material aid to China. In Aug. 1942, he went to India to confer with Lord Linlithgow, British viceroy.

Curtin, John

(1885–), Australian statesman, born Jan 8 at Creswick, Victoria, Australia. Educated in the state schools, Curtin later became actively engaged in politics and labour journalism. As general secretary of the Victorian Timber Workers' union, 1911–15, and editor of the *Westralian Worker,* 1917–28, he became an exponent of the Australian Labour party's dual traditions of nationalism and theoretical socialism. During World War I, he was secretary of the anti-conscription campaign. He was a member of the Australian house of representatives, serving from 1928 to 1931, and again from 1934 to 1941. During the latter period he was leader of the Federa Labour party and the parliamentary opposition. He succeeded Arthur Fadden as prime minister of Australia Oct. 3, 194 Curtin, in a message sent Dec. 24, 1941 to the Roosevelt-Church l war parleys in Washington, blamed Allied reverses in the far ist on the Anglo-U.S. tendency to underestimate the power of ie Japanese. On Dec. 27, 1941, he further declared that Aus- alia relied chiefly on the United States in the war against Japan. On Dec. 10, 1942, Curtin told the Australian house that as llied strategy called first for the defeat of Hitler, Australia had remain on the defensive until the maximum Allied strength ould be concentrated against Japan. As 1942 came to a close, urtin was ready to stake the life of his government on a contro- ersial issue, the conscription of Australian soldiers for over- as duty.

urtis, Heber Doust (1872–1942), U.S. astronomer, was born June 27 in Muskegon, Mich., id received his Ph.D. from the University of Virginia in 1902. e taught mathematics and astronomy at the Leander McCormick oservatory at the University of Virginia, 1900–02. While assist- t astronomer at Lick observatory in California, he was named tronomer in charge of the D. O. Mills expedition to the southern misphere, 1906–09, and upon his return became astronomer at e observatory, 1909–20. He was director of the Allegheny oservatory, Pittsburgh, Pa., 1920–30, and chairman of the as- onomy department at the University of Michigan and director the school's observatory, 1930–42. He died in Ann Arbor, ich., Jan. 8.

ycling. One of the most popular and important international sports events held annually in New York was missing r the third consecutive year when the six-day bicycle race failed appear because of the war. Likewise, there was no competition r world titles, and in the U.S. even the Amateur Bicycle League America, the National Cycling association, and the Century oad Club of America stood pat.

Therefore, cycling circles kept on the books for the duration e 1941 winners as the existing champions. A summary of these 41 winners follows:

The N.C.A. sprint championship was won by Tom Saetta of Brooklyn, ile Mike DeFilipo of Newark won the paced title. The A.B.L. senior id championship was won by Marvin Thompson of Chicago, and the ior title went to Andrew Bernadsky of San Francisco. The girls' cham- n was Jean Michels of Chicago.

The track championships of the A.B.L. were won by Bob Stauffacher of n Francisco, who triumphed in the senior class, and Chuck Edwards of icago, winner among the juniors. Stauffacher also captured the Century ad club's senior title.

The A.B.L. of America selected an all-American cycling group as shown the table.

Name	*City*	*Points*
orge Hurlburt, Jr.	Buffalo	275
rman Kugler	Somerville, N.J.	195
ry Kandler	Milwaukee	190
y Gronkowski, Jr.	Buffalo	115
orge Woof	San Francisco	98
nny Weber	Milwaukee	85
nes Dolle	Irvington, Ind.	84
mer Fiyuyama	Honolulu	79
orge Edge	Philadelphia	74
rry Naismyth	Somerville, N.J.	67
ice Burgess	Irvington, Ind.	65
ncis DeCabe	Honolulu	64

Other events in 1941, the last of their kind to be held for the ration, included an international bike race over the Inter- nerican highway from Tegucigalpa, Honduras, to Guatemala ty. The Guatemala team won with Fraterno Vila, 18-year-old r, pedalling at the rate of 15 m.p.h. Tommy Hayes of Dallas, xas, won the seventh annual national 100-mi. motorcycling ampionship, winning in the amazing time of 1:15:46.51. Also, six-day bike race which was held in Montreal, Canada, was n by the team of Angelo DeBacco of Newark, N.J., and Rene r of Montreal. Second place was taken by the popular team of les Audy of Montreal and Cecil Yates of Chicago.

Czechoslovakia. Czechoslovakia, a republic in central Europe, was totally dismembered in 1938–39 as a result of German aggression. The western part of Czechoslovakia, by far the largest, passed under German domination, either as an integral part of Germany like the Sudetenland or as a "protectorate" (*see* BOHEMIA AND MORAVIA). Of the eastern part, a smaller section to the east and south became part of Hungary (especially Ruthenia), while the part inhabited mainly by Slovaks was established as a nominally independent state in alliance with and under the tutelage of Germany (*see* SLOVAKIA). The area of Czechoslovakia had been 54,244 sq.mi., with a population of 14,729,536 in 1930.

History.—The Czechoslovaks continued to hope and work for their national liberation in 1942. The ruthless oppression in Czechoslovakia and the thousands of executions only strengthened the movement of resistance. The Czechoslovak government, which had been formed in 1940 in London under Dr. Eduard Beneš, comprised Czechs and Slovaks and representatives of all parties.

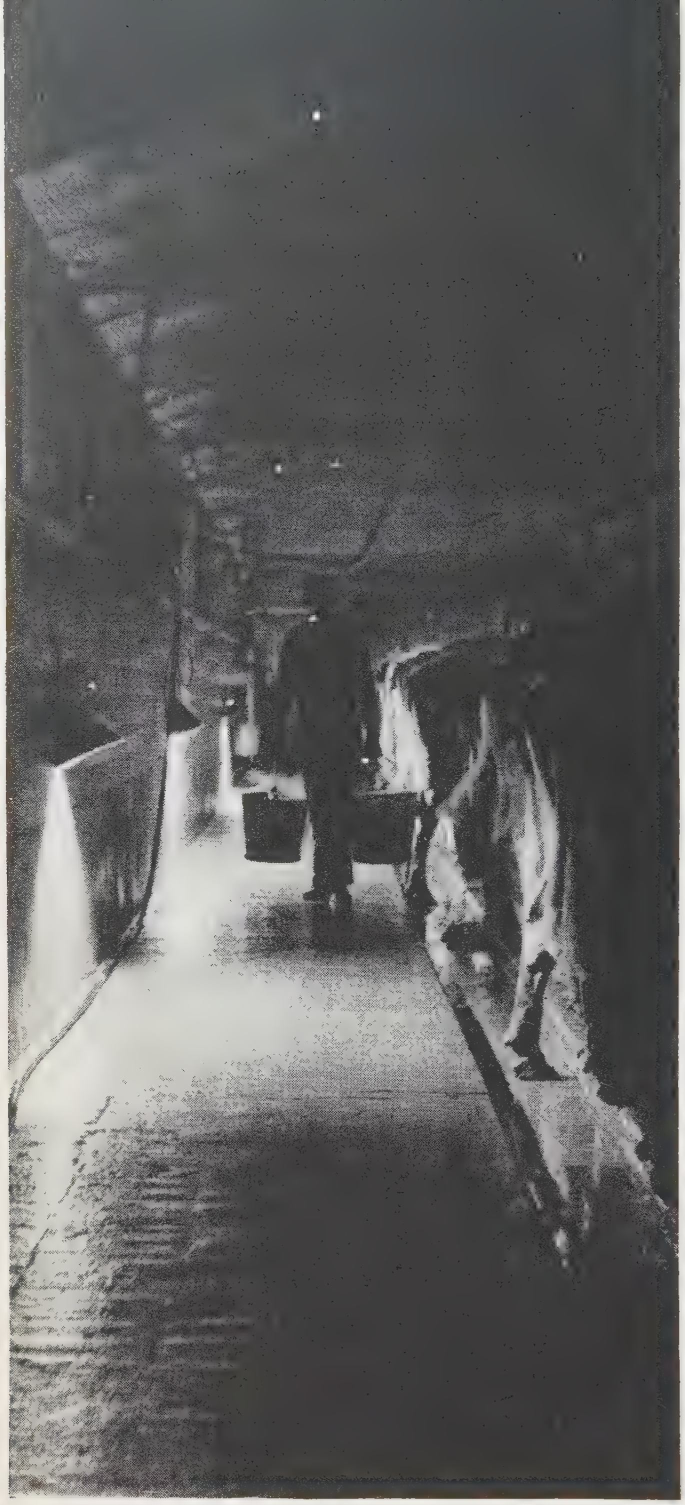
It maintained close contact with the underground movement in Czechoslovakia.

The British government published on Aug. 5 a White Paper according to which the final settlement of Czechoslovak frontiers would not be influenced by any changes effected in and after 1938. By this agreement between Great Britain and Czechoslovakia, the so-called Munich pact of Sept. 1938 was repudiated. It was held that Germany by her aggression against Czechoslovakia in March 1939 had deliberately destroyed the Munich agreement. Thus the British government did not recognize Germany's claim to the Sudetenland or Slovakia's separation from the Czech lands.

The resurrection of Czechoslovakia in her pre-1938 frontiers was made possible.

Another important step was taken by the Polish and Czechoslovak governments in their joint declaration of Jan. 23, 1942, in which they expressed their agreement with regard to the principles of the projected confederation of the two states, foreseen in their declaration of Nov. 11, 1940. It was now declared that the new confederation should embrace also other states with which Polish and Czechoslovak vital interests were linked. The confederation was to have a common policy with regard to foreign affairs, defense, economic and financial matters, social questions, transport, posts and telegraphs. It was to have a joint general staff and in the event of war a unified supreme command. It would co-ordinate the foreign trade policy and the custom tariffs of the member states and agree on a common monetary policy. The development and administration of all systems of transportation and communication was to be carried out according to a common plan. It was of importance that the agreement contained what might be regarded as a federal bill of rights, according to which the constitution of each member state would guarantee to its citizens freedom of conscience and of the spoken and written word, freedom of organization and association, freedom from arrest, freedom of learning, equality of all citizens before the law, admission of all citizens to the performance of all state functions, an independent judiciary and finally the control of government by representative assemblies elected in free elections.

The governments of Czechoslovakia and Poland, "united in their set determination to form a confederation of states in central Europe, based upon close political, military and economic collaboration," adopted on Jan. 24, 1942 a resolution expressing their



HOW TO MILK COWS IN BLACKOUTS was demonstrated throughout California in 1942 by the farm extension service of the University of California after army aviators found that farm lights tended to nullify blackouts in nearby cities

satisfaction with the conclusion of a similar agreement between Greece and Yugoslavia on Jan. 15, 1942. Thus the basis for the reconstruction of central Europe began to take shape in the actions of the Czechoslovak government.

The government in London represented not only Czechs and Slovaks but also the Carpatho-Russians of Ruthenia. Their representative, Dr. Pavel Cibere, and the Carpatho-Russian organizations in the United States worked for "the liberation of Carpathian Russia from the enforced occupation of the Hungarians and its reunion with Czechoslovakia as an autonomous self-governing state." (H. Ko.)

Purchases of Dairy Products by the U.S. Department of Agriculture under the General Commodities Program

Product	Jan.–Nov. 1942 lb.	March 5–Dec. 31, 1941 lb.
American cheese	242,089,000	166,639,000
Processed cheese	24,312,000	1,000,000
Evaporated milk	1,094,636,000	765,264,000
Dried skim milk		
Roller-processed	161,768,000	23,459,000
Spray-dried	73,791,000	15,318,000
Butter	23,206,000	150,000
Dried whole milk	1,969,000	2,576,000
Dried milk powder, mixture	34,000	.
Condensed milk	5,061,000	.
Dried buttermilk	440,000	.

Dairying.

Civilian consumption of all dairy products in the United States in 1942 was announced by the department of agriculture as probably 110,000,000,000 lb. (milk equivalent basis). Consumption in 1941 was 107,000,000,000 lb. the five-year (1936–40) average, 104,500,000,000 lb. Production of milk was 120,000,000,000 lb. (*See* also Milk.) During 1942 the dairy industry was subjected to unusual government orders in connection with assuring large supplies of dairy products for military and lend-lease needs. On Nov. 3 manufacturers were required to set aside for government use 90% of spray-dried and roller-processed skim milk. On Nov. 20 the WPB froze 50% of the cold storage butter in the 35 principal cold storage centres On Nov. 25 the sale of cream having more than 19% butter fat was restricted. On Dec. 4 the quantity used in the manufacture of ice cream and other frozen desserts was limited. Ceilings were established at which the government would support various dairy prices, including butter, cheese and dried milk. The apparent requirements for civilian, military and lend-lease dairy products in 1943 called for production of 140,000,000,000 lb. of milk during the year. This goal was unattainable, the department of agriculture announced, in pointing out that an expected increase in milk production in 1943 could not exceed by much more than 2,000,000,000 lb. the 1942 production of 110,000,000,000 lb. As means of furthering this increase, the department urged that cows be milked three times a day instead of twice a day. Additional feeding of grain, however, would be required.

The number of cows on United States farms in 1942 was 26 000,000. On Oct. 20, 1942, control over the slaughter, movement and sales of livestock was authorized for the secretary of agriculture. This provided authority for prevention of possible reduction in milking herds. (*See* also Butter; Cheese; Milk.)

(S. O. R.)

Dakar.

A French port, naval base, and administrative centre of enormous strategic importance. The city, which is the capital of French West Africa (Pierre Boisson, governor general in 1942), is situated in 14°40′ N., 17°24′ W., on the eastern side of the peninsula of Cape Verde. It is only 1,62 nautical miles from Natal, Brazil. The population in 1939 was 33,673, of whom 2,939 were Europeans; its population in 194 was perhaps as high as 150,000.

The harbour, the best between Casablanca and the Cape of Good Hope, is formed by two jetties, 6,840 and 1,968 ft. long respectively. The entrance is 720 ft. wide. The inside harbour was dredged to a depth of 33 ft. in 1936. There is a drydock 656 ft. long by 92 ft. broad, which will accommodate vessels of 10,000 tons. There is also a naval arsenal, and a torpedo-boat basin. During 1941–42 covering fortresses on Cap Manuel and the isle of Gorée were greatly strengthened, and the garrison heavily re-enforced, is said to have reached a strength of 50,000 composed mainly of native troops with good mechanized equipment.

On Sept. 23–25, 1940, a combined British-Free French attack upon Dakar failed. Thereafter the possibility that it might be p at the disposal of the axis remained a constant source of acu

xiety to the United Nations. Only a few days before the
.S.-British occupation of North Africa in Nov. 1942, rumours
ntinued to circulate that German submarines were being per-
itted to refuel at Dakar or in its vicinity, although such alle-
tions were always officially and emphatically denied. The an-
uncement by Admiral Jean Darlan on Nov. 23 that Dakar and
ench West Africa would join the United Nations was therefore
iled with great relief. Previously, considerable numbers of U.S.
oops had been stationed in Liberia and elsewhere in the general
ighbourhood of French West Africa. On Dec. 24 it was an-
unced that a detachment of U.S. troops had arrived in Dakar,
d as the year ended a U.S. army and navy mission, headed by
ce Admiral Wm. A. Glassford, was in Dakar making arrange-
ents for the use of air fields and port facilities.

Valuable French naval units based at Dakar also came within
e terms of the announcement of Nov. 23. These included the
w 35,000-ton battleship "Richelieu," damaged by the British
July, 1940; the cruisers "Georges Leygues," "Montcalm" and
loire"; besides 3 destroyers and 13 submarines. (*See* also
ENCH COLONIAL EMPIRE.)

BIBLIOGRAPHY.—Emil Lengyel, *Dakar* (1941). (A. M. WN.)

almatia.

A Yugoslav province on the northeastern shore of the Adriatic sea, inhabited by Croats. After World
ar I the Italians had raised claims to Dalmatia, though ethno-
aphically the country was without doubt Yugoslav, and the
pulation had expressed its firm rejection of Italy's claim. World
ar II seemed to fulfil the Italian aspirations. When Yugoslavia
llapsed under German aggression in April 1941, the Dalmatian
ast was largely annexed to Italy, especially the important naval
rts of Cattaro and Spalato. Only a small part of the coast,
cluding the city of Ragusa, became part of Croatia, yet this
rt too was occupied by Italians and put under Italian military
ntrol. Thus the whole of Dalmatia had become, directly or
directly, part of Italy.

But Italian control of Dalmatia was in no way secure in 1942.
ough little authentic news could be gathered from the hermeti-
lly sealed occupied parts of the Balkans, it was nevertheless
ar that Croat and Serb patriots were waging incessant warfare
ainst the Italian army of occupation. From neighbouring Bosnia
d Herzegovina the army of General Mihailovitch supported the local patriots in their steadfast resistance. (*See* also CROATIA; MONTENEGRO.) (H. Ko.)

Dams.

The table below includes 20 of the many important dams of the world completed or under construction during 1942.

Water spilled over the world's largest concrete dam, Grand Coulee, for the first time on June 1, 1942. The spillway, 1,500 ft. long, discharged 1,500,000 gal. per second, creating a waterfall as great as Niagara falls and three times as high. The reservoir behind the dam covered 82,000 ac. and was 151 mi. long. With the dam completed, work was concentrated on the 2,000,000-kw. hydro-electric plants at the base of the dam. This power was expected to pump water into a reservoir at an elevation 280 ft. higher, whence it would flow by gravity to irrigate more than 1,000,000 ac. of barren land.

At the Central Valley project in California, construction proceeded on Shasta, second largest concrete dam, at the rate of 200,000 cu.yd. per month. With its 3,000,000th cu.yd. of concrete in place in April, it was well past the halfway mark. Friant dam, other major feature of this project and world's fourth largest concrete dam, was completed June 16. Its construction equipment was transferred to the Dale Hollow dam, a hydro-electric project on the Obey river in Tennessee.

At Boulder dam, third largest concrete dam, the tenth 82,500-kw. generator was installed, bringing the capacity of the plant to 952,300 kw. of its eventual total of 1,322,300 kw.

A number of dams for hydro-electric developments in the Tennessee valley were completed during 1942. Others, near completion, were already storing water. Cherokee dam on the Holston river was completed in 20 months, 4 months ahead of schedule. Its construction equipment was transferred to Douglas dam on the French Broad river, an almost exact duplicate of the concrete section of Cherokee dam. Nantahala dam, a 270-ft.-high rockfill, was completed well ahead of schedule. It provided storage for a 1,005-ft.-head hydro-electric plant, second highest in eastern United States.

Construction was commenced on a 2,200-ft.-long submerged dam to preserve the natural beauty of Niagara falls. It was being built just above the Horseshoe falls and would compensate for the reduced flow due to increased diversion of water for the gen-

Chief Dams Completed or Under Construction During 1942

Name of Dam	River	Place	Type	Maximum Height, Feet	Crest Length, Feet	Volume (Cu. yds.)	Purpose*	Built by	Progress*
nderson Ranch	Boise, S. Fork	Idaho, U.S.	Earthfill	330	1,350	9,500,000	I, F, P	U.S. Reclamation Bureau	U

olf Creek	Cumberland	Kentucky, U.S.	Earthfill and concrete gravity	242	5,730	11,500,000 (earth) 1,250,000 (conc.)	F, P	U.S. Army Engineers	U

—Irrigation, C—Completed in 1942, U—Under construction, F—Flood control, W—Water supply, P—Power.

THREE 8-HOUR SHIFTS worked daily on the Douglas dam of the TVA on the French Broad river, Tenn., in 1942 to complete the structure in the scheduled 12 months

eration of hydro-electric power. It would also serve to avoid a power shortage in case of ice jams. A 2,600-ft. cableway, formerly used on the construction of Conchas dam and then on Denison dam, was erected to facilitate construction.

In Canada a number of hydro-electric projects were rushed to completion to produce power for the manufacture of aluminum and other vital war materials. The Shand dam on the Grand river in Ontario was also completed. Built by the Grand River conservation commission, it is 2,100 ft. long and 75 ft. high, of rolled earthfill with a concrete spillway.

A number of projects of the Mexican national commission of irrigation were nearing completion. The Dique la Vina dam for an irrigation project in Argentina was reported to be the highest arch dam in South America. Irrigation dams on the Caledon and Orange rivers were also announced by the irrigation division of the Union of South Africa. However, two irrigation dams on the Sand and Vet rivers in South Africa were held up for the duration of the war. Work on storage and irrigation dams in India had not been held up. The Mysore government continued construction of the Jog falls scheme on the Sharavati river to develop 120,000 kw. Construction by the Afghan government of a large flood control and irrigation dam in western Afghanistan was also reported. (*See* also AQUEDUCTS; IRRIGATION.) (B. O. M.)

Dance. Participation dances of various types set the pace for the year 1942. "Participations" are especially recommended for the encouragement of mixing. A bashful boy or a shy maiden cannot long resist the group movement when everyone joins hands and begins a rhythmic march around the dance floor. For this reason, participation dances were especially popular at functions where service men were invited guests, like the various canteens, recreation centres, and other such patriotic gatherings.

The Polka continued to head the participation parade. This old-time folk dance, which had been enjoying some degree of renewed popularity, was further spurred on its way in 1942 by several extremely popular dance band recordings in its idiom "The Beer Barrel Polka," introduced in 1939, carried over into 1942, and such newcomers as "Strip Polka," and the more recent "Pennsylvania Polka," dancing out of a million juke boxes across the land, hurried the success of the polka as a social dance form in 1942.

The South American dances, spotlighted by this era of Pan Americanism, also enjoyed a wholesome acceptance in the United States during 1942. Most popular of these, in point of actual gain, was the samba, a comparative newcomer from Brazil More involved than the rumba, the samba depends for its popularity on the entrancing rhythm which backgrounds its performance on the ballroom floor. Its sudden popularity in the United States may be due to the wave of Brazilian music and songs featured in several Broadway musicals and in the films. Also the samba is a bit more spirited than the rumba—another indication of the faster tempo of the times.

The rumba itself continued to improve its hold on the fancy of the American dancing public. Called by many the aristocrat of Latin American rhythms, the rumba continued to challenge the smooth technique of the truly accomplished dancers.

The rapidity with which a novelty dance will fade was vividly demonstrated in 1942 by the quick decline of the conga. One of the biggest dances in American ballrooms, in 1940 and 1941 the conga hit its peak before 1942 began, and witnessed a steady drop throughout the year. It was a great dance while it lasted but the conga was too simple for sustained popularity such as the rumba enjoyed.

In the native American dance field, the fox trot continued its grasp on top position. Most of Tin Pan Alley's musical output is written in fox trot tempo, which greatly influences the type of dance performed on ballroom and cabaret floors. The waltz too, remained high on the list of dance favourites, due undoubtedly to its inherent grace, charm and ease of performance e Peabody, which had been declining, continued to decline in 2, due, perhaps, to the growing lack of floor space for this le-striding dance.

Two new dances, introduced in 1942, show signs of rising in ularity during the coming year. They were the victory walk, roduced by Arthur Murray following a request by the Office War Information for a dance to be performed in marching po; and the dance, also created by Arthur Murray, called raise the Lord and Pass the Ammunition," written for execu- n with the popular song of the same name. (A. Mu.)

Ballet.—As Russia put up her mighty fight against aggression, let entertainment behind the lines refreshed the men at the nt. The ballet theatres of Moscow and Leningrad moved to temporary capital of Kuibyshev, where new works were duced, and a revival of *Don Quixote* with new dances by leizovsky and new settings by Zacharov.

n England, ballets on *The Birds* (to Respighi's score, no con- tion with Aristophanes), *Comus, Hamlet,* were created by bert Helpmann for the Sadler's Wells ballet, which toured provinces and played good seasons at the New theatre, Lon- . Andrée Howard choreographed *Twelfth Night* for the Inter- ional ballet, which like Allied ballets and the Ballet guild, was ive. The *Dancing Times,* reduced in size and circulation, was lished regularly.

n Australia the Kirsova ballet, founded in Sydney by Hélène rsova, former Ballet Russe dancer, in 1941, presented mainly rks from the standard repertoire. In Switzerland an evening ballet, conducted by Ernest Ansermet, figured in the Zurich eatre festival.

n China, where dance is an integer of the theatre (and part a soldier's training, too), groups of players gave performances n village to village, from regiment to regiment.

Between the Americas the flow of traffic was somewhat cur- ed, but Col. W. de Basil's Original Ballet Russe finally arrived South America, after a Mexican sojourn, and was said to end touring that continent for the duration of the war. Balan- ne spent two months of the northern summer staging ballets the Colon, Buenos Aires, Arg.

Among major companies in the United States, Ballet Theater e to top level, while the older Ballet Russe de Monte Carlo k second place. S. Hurok managed both companies until vember, when the latter company came under the aegis of umbia Concerts. A New York spring "Season of Ballet" the Metropolitan Opera House combined the two in succes- e weeks, when for Ballet Theater, Antony Tudor's *Pillar of* won a succès d'estime, and Fokine's *Russian Soldier* proved be a pièce d'occasion. The Monte Carlo company revived ssine's *St. Francis,* but presented no new works at that time.

Ballet Theater spent six summer months in Mexico City. dquartered at the Palacio de las Bellas Artes by invitation the Mexican ministry of education. Baronova and other mbers of the company made the Spanish-language film, *Yo- da,* for Promesa Films, S.A. Massine, who in November joined company, went with them as guest choreographer, as did maestro, Michel Fokine, to work on his *Helen of Troy,* de- ed from Offenbach's *La Belle Hélène.* The passing of the great re of Russian ballet, late in the summer, marked the close of epoch in ballet history.

Helen of Troy, Massine's *Aleko* and *Don Domingo,* were tried in Mexico City without conspicuous success, and the latter fared little better in their New York premieres at the Metro- itan in October, when Hurok staged a joint fall "Season of let." Since Fokine did not live to make necessary revisions *Helen of Troy,* David Lichine made a completely new version ich received its world premiere in Detroit in December. Other Ballet Theater premieres were Dolin's *Romantic Age* and Semenoff's restaging of *Coppélia* in one act and two scenes. A Fokine Memorial program, consisting of *Les Sylphides, Petrouchka* and *Bluebeard* was given. Fall premieres by the Monte Carlo company were: Bronislava Nijinska's *Chopin Concerto* and *Snow Maiden,* and Agnes de Mille's *Rodeo* (with score by Aaron Copland), the latter a decided hit.

The Jooss ballet, after a difficult co-season with the Boston Light Opera company, offering ballet curtain-raisers to Gilbert and Sullivan operettas at the St. James theatre, N.Y. finally returned practically en masse to rejoin their director, Kurt Jooss, in England. Among those remaining in the U.S. were Elsa Kahl and her husband, the former music director, Frederic Cohen, Jack Gansert, who became a soloist in the Metropolitan Opera ballet, and Lucas Hovinga, who later became a U.S. soldier.

The Graff ballet made its Broadway debut at the Concert theatre in January, lost at least two men to the armed forces of the U.S. but carried on touring and summering at Newfane, Vt. as usual. A new group composition, *Phoebe's Fall,* was added to the repertoire. By December all but Kurt Graff, of the men, were in service.

Dance Players, headed by Eugene Loring, made their N.Y. debut at the National theatre in April, after a brief tour, with premieres of Loring's *Prairie* and *The Man from Midian,* and Lew Christensen's *Jinx.* Loring's *The Duke of Sacramento* was produced during a summer session at New Hope, Pa. Christensen later went into the army. After a few fall appearances in the east, the company suspended performances until Jan. 1943, when a full western tour was booked. The Negro Dance company, headed by Wilson Williams, went into rehearsal in the fall in preparation for a Jan. 1943 season.

Lincoln Kirstein's Ballet Caravan, was quiescent during the greater part of the year, until some of their members appeared in the New Opera productions at the Forty-Fourth Street theatre in the fall, including Balanchine's *Ballet Imperial,* presented in conjunction with *The Fair at Sorochinsk.*

Ballet took to roller-skates for the first time in the *Skating Vanities of 1942,* a roller-skating extravaganza. Other developments in the amusement field, in addition to the popular *Ice-Capades* and *Stars on Ice,* were an elephant ballet staged by Balanchine (to music of Stravinsky) for Ringling Brothers-Barnum & Bailey's annual circus, and an aerial ballet.

BIBLIOGRAPHY.—England: C. W. Beaumont, *Supplement to the Complete Book of Ballets;* Gordon Anthony, *Margot Fonteyn* (camera sketches) with an appreciation by Evelyn Leith; Kay Ambrose and Arnold Haskell (pictures and text), *Balletomane's Sketch Book.*

Concert Dance in 1942 was confined by global war largely to the U.S., but retained a certain amount of international flavour. Here, as in ballet, change was the constant, travel increasingly restricted, and imminence of draft calls perpetuated uncertainty. There was much dancing for service men in U.S.O. centres.

Among the war-bound were Devi Dja and her Bali-Java dancers and musicians, whose farewell tour on the Pacific coast became perforce an extended American engagement. While in Hollywood they did the native dances for the Somerset Maugham film, *The Moon and Sixpence,* under Devi Dja's direction.

La Meri, American exponent of the Hindu dance and other Oriental forms, became affiliated with the East and West association, appearing with her Natya dancers in curtain raisers to the society's meetings for improving relations between the occidental and oriental peoples (chiefly of India and China), playing other engagements also and continuing her school of Natya and the fortnightly "reunions."

Another English-speaking dancer of Oriental predilection, devoting herself to the court dances of the far east—Seiko Sarina—appeared at the Jacob's Pillow Dance festival and in Ruth St.

CARMEN AMAYA, Spanish gypsy dancer, made her concert debut with her troupe at New York city in 1942

"LA FILLE MAL GARDÉE" was a successful presentation of the Ballet Theatre in New York city in April 1942

EUGENE LORING, choreographer and first dancer of the n Dance Players in 1942

HELEN TAMIRIS and Daniel Nagrin in "Liberty Song," a bal of 1942 based on songs of the American Revolution, with mu arranged by Genevieve Pitot

enis' studio before setting out in December for a South Amer-
n tour. Miss St. Denis continued her work in religious dances
d oriental impressions. Other Hindu dancers, native and other-
se, appeared from time to time.

Argentinita, who had been indisposed for almost a year, made
brilliant comeback with her Spanish ensemble in New York,
d later appeared in the musical, *Top-Notchers* and in the
riety-revue, *Priorities of 1942.* She withdrew from the latter
tour in December when her partner, Federico Rey, a Holland-
nerican, was called to the colours, and was obliged to postpone
r concert tour until 1943.

Carmen Amaya, the flamenco dancer, with Antonio Triana
ormerly Argentinita's partner) and a large company of Amayas,
ade her concert debut in Carnegie hall, N.Y. in January, ap-
ared later in Boston's Symphony hall, made the screen musical,
nama Hattie, returned for a single concert in Carnegie hall
December, and then reverted to the supper club scene.

Carmelita Maracci, Spanish-American, with her company, again
ssed the continent in a station wagon, returning to California
er a single New York appearance (at the Young Men's Hebrew
sociation) by a heavily booked route early in the year. Angna
ters, dance-mime, toured extensively the U.S. and Canada,
lding simultaneous exhibitions of her paintings in several
ies; resumed her Christmas week sojourn at the Alvin theatre,
Y. (omitted in 1941) with new works. Huapala, American
ecialist in the Hawaiian dance, assisted by a group of eight
ncers and William Kalama and his Hawaiian musicians, gave
elevision program in January. Gladys and Reginald Laubin
ntinued to interpret the American Indian dance.

Much was made of modern dance as part of the physical fitness
ogram in war work, Steffi Nossen, among others, specializing
this.

There was no Bennington festival in 1942, but a feature of
summer session was a Forum on the War and the Future.
asses in dance were held, however, with Martha Graham and
company in residence, teaching and preparing a new work
later production, and private concerts were given.

At the Studio theatre Doris Humphrey and Charles Weidman
esented Mr. Weidman's *Flickers* in January, and revived Miss
mphrey's *With My Red Fires* in an April post-season. The
42–43 repertory season opened late in December in New York
h an all-Bach program by Miss Humphrey, with José Limon,
t dancer in the New Opera's *Rosalinda,* as guest artist.

Hanya Holm made no formal presentation of new works in
w York, but experimentally produced at Colorado college
ring the summer, with Arch Lauterer, former stage designer
many notable Bennington productions, and composer Roy
rris, as artistic collaborators.

The big festival of the year was the ten-week summer session
Jacob's Pillow, near Lee, Mass., with Ted Shawn managing
ector and occasional dancer, his former estate now owned and
erated by the Jacob's Pillow Dance Festival, Inc. A new dance
eatre was opened with the first festival performance in July,
the Berkshire Folk Dancers and their fiddling caller, Sammy
ring. A different guest artist each week taught and, with group
company, gave four performances each.

There was a resurgence of Duncanism, with Maria-Theresa
ne of the six "Isadorables") and her Heliconiades appearing
Carnegie hall and elsewhere; Anna Duncan (another) at the
cob's Pillow Dance festival; and most of the contemporary
ncan students and disciples joining in a Duncan Dance con-
ess at the Y.M.H.A. in November. *Dance Index* devoted its
st issue to a monograph on Isadora.

Britain and her commonwealth of nations, preferring ballet
d ballroom in any case, had little desire, if opportunity, to sample other forms. But according to the *Dancing Times,* Rafiq Anwar and his company of Indian dancers played a short London engagement in October. (M. L.)

Dandurand, Raoul (1861–1942), Canadian lawyer and statesman, was born Nov. 4 in Montreal, Que. He was minister without portfolio and leader of the government in the senate from 1921 to 1930 and from 1935 until his death. Dandurand represented Canada at the League of Nations assembly in 1924. He was elected president of the assembly in 1925 and was appointed delegate to the league council in 1927. In June 1941, he was made imperial privy counsellor. He died in Ottawa, Ont., March 11. (See *Encyclopædia Britannica.*)

Darlan, Jean Louis Xavier Francois (1881–1942), French naval officer and statesman, was born Aug. 7 at Nérac, France. He entered the navy in 1899 and during World War I commanded a battery of naval guns on the western front and participated in operations on the Balkan front. In July 1918 he returned to the sea as captain of a warship. After the war, he advanced through the grades to vice admiral and was commander in chief of French naval forces, 1939–40. With the fall of France in June 1940, Darlan was named navy minister in the Pétain government.

An ambitious politician, he rose swiftly in the Vichy cabinet, becoming vice premier and heir apparent to Pétain's mantle as chief of state in Feb. 1941. Darlan held as many as six portfolios at one time, instituted many fascist laws and collaborated closely with Hitler's agents. When Laval returned to nazi favour, Darlan relinquished all his posts save that of defense minister. Darlan was on an "inspection tour" of French North Africa when U.S. troops landed in Algeria and Morocco, Nov. 8, 1942. "Held in custody" by U.S. commanders, he ordered French forces to cease fire, joined the Allied cause and by Dec 1, he assumed office, with U.S. approval, as French chief of state in North Africa. President Roosevelt called Darlan's regime a "temporary expedient." Fighting French authorities nevertheless branded him as an untrustworthy opportunist and traitor. Darlan himself said that his sole purpose was to "save French Africa, help free France and retire from public life." The Darlan controversy was permanently settled when a young unidentified Frenchman shot and killed him as he was entering his office in Algiers on Dec. 24.

Dartmouth College. An institution almost wholly undergraduate, for men, at Hanover, N.H. In line with plans formed and announced immediately after Pearl Harbor, Dartmouth operated on a continuous, three semester-per-year basis in 1942 which resulted in advancing graduation for the class of '43 from June to Dec. 12, 1942. Acceleration was not, however, accomplished at the expense of standards held prerequisite to the baccalaureate degree. Eight semesters of work were still required for the degree and admission was granted only to high standing secondary school students who had completed their full four years of college preparation. A certificate of merit is awarded undergraduates who have completed a considerable portion of their college work but are forced to leave for military service.

President Hopkins stated that Dartmouth would continue to operate even though there were "only a dozen" regularly enrolled students. Beginning in July 1942, part of the plant was used for a U.S. naval training school (indoctrination) of 1,000 commissioned officers. For statistics of enrolment, faculty, endowment, library volumes, etc. *see* Universities and Colleges. (S. C. Ha.)

Daudet, Léon (1867–1942), French writer and politician, was born Nov. 16, the son of the great novelist, Alphonse Daudet. A talented polemicist and master of invective, he joined the French royalist party in 1906 and spent nearly 40 years pouring vituperative epithets on the French republic from the editorial columns of *L'Action Française,* royalist organ. He accused Premier Raymond Poincaré and President Alexandre Millerand of engineering a plot which resulted in the death of his son, who was killed under mysterious circumstances in 1923. He also accused a taxi chauffeur of complicity in the "republican" plot; the chauffeur sued Daudet for criminal libel, and Daudet was sentenced to five months in prison. The French authorities, however, were reluctant to carry out the sentence, fearing to make a political martyr out of the royalist leader. Finally in 1927, they called on him to surrender. Freed after 13 days by a ruse, Daudet fled to Belgium. Two years later, he was pardoned and allowed to return to Paris.

When *L'Action Française* adopted a pro-British stand at the start of World War II, Daudet ceased to become a regular contributor. He lived in virtual obscurity after the nazi occupation in 1940 and died at Saint-Rémy de Provence, July 1. (See *Encyclopædia Britannica.*)

Daughters of the American Revolution.

Organized Oct. 11, 1890, the D.A.R. makes eligibility for membership dependent upon direct descent from a patriot who aided in securing American independence. Membership in 1942 was approximately 145,000 in 2,569 chapters in every state and in many countries. President general: Mrs. William H. Pouch. Headquarters: Memorial Continental hall, Washington, D.C.

In 1942 the organization made gifts of $110,000 to 14 approved schools for foreign born and southern mountaineers. Other activities for the year included instruction in the right use of leisure and respect for rights of others to 245,000 children in Junior American Citizens clubs; and distribution of about 340,000 manuals for citizenship, in 16 languages, to aid in naturalization. The society maintains a student loan fund to assist worthy you people in the pursuit of education. About 55,000 copies of t *National Defense News,* designed to promote confidence in fund mentals of the American form of government, were distribute Distribution of Flag Codes and other patriotic literature reach into hundreds of thousands. The society publishes the *Natio Historical Magazine.* Through some 400 clubs the society fu thered its educational endeavours through training in hom making. Through the medium of radio the society furthered objectives to perpetuate the memory and spirit of the men a women who achieved American independence, to develop an e lightened public opinion—to foster true patriotism and love country. By use of a national catalogue, papers of histori import were lent to the some 2,500 chapters. Through t conservation committee a program was launched in all 2,5 chapters to procure scrap metal for the U.S. government.

THE PRESIDENT-GENERAL of the Daughters of the American Revolution, Mrs. William H. Pouch, at the D.A.R.'s 51st continental congress in May 1942 at Chicago. Never before had the annual congress been held outside Washington, D.C.

The society adopted as its principal war project the D.A. War Project Fund, resulting from voluntary contributions of or more from members to be used to further the U.S. blo plasma program and to purchase surgical and medical equipme In Oct. 1942 two blood donor centres were purchased at $2,o each for the American Red Cross: also ten blood plasma mob units at $2,350 each. (H. R. P.)

Davis, Elmer (1890–), U.S. journalist, radio news an lyst and government official, was born Jan. in Aurora, Ind. A graduate of Franklin college, he was a Rhod scholar at Queens college, Oxford university, completing h studies there in 1912. Davis was a reporter and editorial writ on the *New York Times,* 1914–24, wrote a dozen books, inclu ing essays, short stories and satires, and reached the top ru of radio fame in 1939 as a news analyst for the Columbia Broa casting system. On June 13, 1942, President Roosevelt announc his decision to fuse the various overlapping government inf mation services into a single centralized organization and a pointed Davis to head the new organization, known as the O (Office of War Information, *q.v.*). Davis had the delicate ta of co-ordinating the government's war publicity, keeping t public informed on war news and conducting short-wave d sertations on democracy to people throughout the world. H work was complicated by army and navy censorship, although several occasions in 1942 the OWI defended the naval poli of delaying publication of losses on grounds that the immedi publication would be of value to the enemy. Under his dir tion, the OWI took a frank view of the war, consistently wa ing the American people that the conflict would be long and ha

Davis, Robert Hobart (1869–1942), U.S. editor a writer, was born March 23 Brownville, Neb. He attended school in Carson City, Nev., wh he later became compositor on a local newspaper. While work in San Francisco on a similar job, he was made a reporter on t strength of a humorous baseball story he wrote when the origi piece of copy he was to set in type was lost. In 1904 he beca managing editor of the *New York Sunday News.* He was la an editor in the Frank A. Munsey organization and associ editor of *Munsey's Magazine.* From 1926 to 1942, he wrote column in the *New York Sun* entitled "Bob Davis Reveals," a his globe-trotting experiences provided him with the stories a anecdotes that filled his column and books. He wrote a ser of Bob Davis books and was co-author of *The Caliph of Bagda Life of O. Henry* (1931). Among his other works are *Man Ma His Own Mask* (1932), *People, People Everywhere* (193 *Canada Cavalcade, Oriental Odyssey* (1937) and *Hawaii, U.S* (1941). He died in Montreal, Oct. 11.

afness.

Hearing Aids.—Individuals having difficulty in hearing conversation at a distance of five feet less in relatively quiet places such as the office or the home y be helped by wearing a hearing aid. Routine medical exami- ions of hard-of-hearing persons should include audiometric ts and will usually indicate to the otologist whether the patients l be benefited sufficiently to warrant the expense of purchasing aid. The so-called vacuum tube hearing aid utilizing a crystal rophone was the prevailing type being marketed in 1942. ctrical and acoustical research and development have greatly proved the modern hearing aid.

The vacuum tube hearing aid complete weighs somewhat less n a pound and consists of a small crystal microphone and a iature vacuum tube amplifier built in a wearable case (2 oz.), nd B batteries (7 to 9 oz.), a receiver (1 oz.) and wire con- tions. The receiver may be of two types: air conduction, a ll button which fits closely in the external meatus of the ter ear; or bone conduction, a receiver which rests on the stoid and is held in place by a spring headband. An otologist's mination generally determines which type of receiver will give most satisfaction to the patient.

The operating expense of an aid depends largely on the number hours the aid is in use—roughly speaking, it costs $3.00 to 00 per month for battery upkeep.

There are methods and instruments designed to assist the fitter he selection of an aid, and to a limited extent they do help, these procedures have not been perfected. Thus the final ision rests in a large measure on the satisfaction obtained by user after the hearing aid has been tried out for a few weeks. A list of accepted hearing aids and requirements on which eptance is based may be obtained from the Council on Physical rapy of the American Medical Association. (H. A. C.)

aths (of prominent persons in 1942): *see* OBITUARIES.

ath Statistics.

Provisional reports indicated that health conditions among the civilian population the United States, Canada and England and Wales were ex- tionally good during 1942, despite the disruptions to normal induced by the war. In the United States, there were 3.4% er deaths reported for the first eight months of 1942 than the like period of 1941, which was itself a record health r with a total of 1,395,907 deaths and a death rate of 10.5 per 00 total population. Canadian communities of 10,000 or more population experienced a drop of 1.6% in the number of ths during the first eight months of 1942 as compared to the e period in 1941. For all of Canada, deaths in 1941 totalled ,427 and the death rate was 10.0 per 1,000 population. During 1 there were 535,180 deaths from all causes in England and les, with a corresponding death rate of 12.9 per 1,000 popu- on. The great towns of England and Wales reported a de- ase of 15.4% in deaths from 1941 to 1942, the period of com- ison ending in August of each year. A good part of this rease may be attributed to the marked reduction in the scale of ial bombardment by the enemy. Since the outbreak of war in t. 1939 up to the end of Aug. 1942, there were 45,792 civilian raid deaths in Great Britain; of this total, 2,563 were in 1942.

The European population of New Zealand had a death rate 9.8 per 1,000 in 1941. Other countries reporting death rates 1941 were: Bulgaria, 12.5; Denmark, 10.3; Hungary, 13.2; y, 13.9; Netherlands, 10.0; Portugal, 17.6; Sweden, 11.2; tzerland, 11.1; Germany, 12.3; Eire, 16.3; Chile, 19.8; Ven- ela, 17.1; Salvador, 16.9. Death rates reported for the war- countries of continental Europe must be interpreted cau- isly since the unsettled conditions affect their reliability. Health conditions in the prewar years of Japan were about the level of those in the United States of about 1900. In the period 1936 to 1938 Japan had a death rate of 17.4 per 1,000, not far removed from that of 17.6 per 1,000 in the United States of 1900.

In 1941 death rates varying from 8.3 to 8.9 per 1,000 were found in eight states—Arkansas, Idaho, North Carolina, North Dakota, Oklahoma, South Dakota, Utah and Wyoming. In contrast to these states with low death rates, another eight had rates varying from 12.0 to a maximum of 12.6 per 1,000; they were Arizona, Delaware, Florida, Maine, Maryland, Nevada, New Hampshire and Vermont. In many of these states the rates are high because the state contained a large proportion of persons of advanced ages, where mortality is high, or because they contained large numbers of Negro persons, among whom the death rate is high.

When deaths in 1940 were allocated according to the residence of the decedent, it was found that cities of 100,000 and over had a death rate of 11.3 per 1,000; cities of 10,000 to 100,000, a rate of 11.4; cities of 2,500 to 10,000, a rate of 12.4; and the rural area, a rate of 9.8.

There is a marked variation in the death rates among the races in the United States. In 1940, the latest year of complete record, white persons had a death rate per 1,000 population of 10.4; Negroes, 13.9; Indians, 14.3; and Chinese, 15.3. White males had a death rate of 11.6 per 1,000, while for white females, it was only 9.2. Among the other races as a whole, principally Negro, the rates were 15.1 for males and 12.6 for females. The variation in mortality with age during 1940 was as follows; in the first year of life there were 47 deaths per 1,000 live births. At the remaining ages, the death rates per 1,000 persons within the specified age groups were: for ages 1 to 4 years, 2.9; 5 to 14 years, 1.0; 15 to 24 years, 2.0; 25 to 34 years, 3.1; 35 to 44 years, 5.2; 45 to 54 years, 10.6; 55 to 64 years, 22.3; 65 to 74 years, 48.0; and 75 years and over, 129.1. In 1940 the death rate was at a minimum of 9.4 per 1,000 in August and at a maximum of 12.6 per 1,000 in January and February.

The death rates per 100,000 population for the leading causes of death in 1941, as compiled from the provisional records for 32 states were: diseases of the heart, 295.4; cancer and other malignant tumours, 121.2; cerebral haemorrhage, embolism and thrombosis, 90.1; total accidents, 72.7, in which is included automobile accidents, 27.5; nephritis of all forms, 72.2; diseases of the digestive system, 53.5; pneumonia, all forms, 46.6; tuberculosis, 42.2; diabetes mellitus, 26.6; and influenza, 15.1.

The most current picture of mortality from the more important causes of death is provided by the records of the millions of policyholders carrying industrial insurance in the Metropolitan Life Insurance company. The report for the first nine months of 1942 showed that mortality from influenza and pneumonia was not far from one quarter of its level in 1917, the year of the United States entry into World War I. A substantial part of this improvement was made in the last few years by the introduction of serum treatment and the sulpha drugs. The mortality from tuberculosis in the first nine months of 1942 was the lowest on record and indicated that the death rate for the year might be only one quarter of that 25 years previously. However, it seemed necessary to guard against a setback which might result from overcrowding in centres of defense industries, and from inadequate medical attention and hospital care arising from the demands of the army and navy for physicians and nurses. Scarlet fever, whooping cough and diphtheria also established new low records. Mortality from cerebral haemorrhage, chronic heart disease and chronic nephritis was lower in 1942 than in 1941, while cancer and diabetes showed practically no change. Diseases of the coronary arteries showed an increase in mortality. The suicide death rate was very favourable, a situation usually observed in time of war. Accident fatalities increased somewhat from 1941 to 1942, despite a 15% decrease in motor vehicle accidents. The decrease in the latter may be attributed largely to the restrictions in automobile travel.

The increase in other forms of accidents may be traced principally to industrial accidents resulting from the speed-up of industrial activities because of the war.

An analysis of deaths according to age in the United States during 1940 showed that in the first year of life premature birth accounted for 29.1% of the deaths and influenza and pneumonia for another 15.8%. For the remaining ages, the leading causes of death, and the percentages of total deaths within the specified age groups were: ages 1 to 4, influenza and pneumonia (21.6%), diarrhoea and enteritis (10.4%); ages 5 to 14, motor vehicle accidents (11.1%), influenza and pneumonia (8.7%); ages 15 to 24, tuberculosis (18.6%), motor vehicle accidents (14.0%); ages 25 to 44, diseases of the heart (14.4%), tuberculosis (14.3%); ages 45 to 64, diseases of the heart (29.7%), cancer (16.3%); ages 65 and over, diseases of the heart (36.6%), intracranial lesions of vascular origin (12.2%).

According to mortality statistics for the general population of the United States in 1940, the latest year of complete record, the average length of life (expectation of life at birth) was 63.77 years, compared to 49.24 years in 1901. The average person 19 years old in 1940 had as many years of life remaining as a newborn baby in 1900 had on the basis of health conditions then prevailing. White males in 1940 had an average length of life of 62.94 years, and in 1901, an average of 48.23 years. For white females, the corresponding figures are 67.31 years and 51.08 years. Among the Negroes, the average length of life in 1940 was 53.04 years for males and 56.01 years for females, while in 1901, the corresponding figures were 32.54 years and 35.04 years. The current figures for the Negroes compare well with the recent record for some countries of Europe. Thus, Italy in 1930–32 had an average length of life of 53.76 years for males and 56.00 years for females.

De Beck, William

(1890–1942), U.S. cartoonist, was born April 16 in Chicago. He studied art there and drew illustrations for a theatrical weekly. He was editorial cartoonist on the Pittsburgh *Gazette-Times* and then did a series of cartoons for the Chicago *Herald.* De Beck was hired by King Features syndicate in New York in 1919 and there created the famous comic strip characters, Barney Google and Spark Plug, who enriched U.S. slang with such expressions as "heebie-jeebies," "horse feathers" and "jeepers creepers," and were popularized by toys and souvenirs. De Beck died in New York city, Nov. 11.

Defense Health and Welfare Services, Office o

Concerted effort to meet major health and welfare problems gro
ing out of World War II was facilitated in 1942 through t
Office of Defense Health and Welfare Services. This agen
guided the war programs of the Federal Security agency and c
ordinated the activities of other organizations, public and privat
in meeting critical wartime problems of health, welfare, educ
tion and recreation.

In more than 1,000 U.S. defense communities where local c
ganizations had been unable to provide sufficient health and w
fare services, the ODHWS helped in surveying the needs, develo
ing local resources and securing federal funds.

Recreation field representatives assisted in developing effecti
community recreation programs. A division of physical fitne
worked on the special problem of interesting individuals in t
improvement of their health and physical condition.

The Family Security committee, advisory to the director, c
ordinated activities of governmental and voluntary agencies
war-created welfare problems. The problem of providing servic
for the children of mothers in wartime employment was made t
special responsibility of the day care section of the ODHWS.

Protecting service men and industrial workers from the spre
of venereal disease was the concern of the social protection se
tion, which stimulated the work of law enforcement officers du
ing 1942 in the repression of prostitution.

The co-ordination of wartime health and medical progra
was the work of the Health and Medical committee. Its su
committee on nursing was especially active in 1942 in helping
the recruitment of nurses throughout the U.S. to meet the sho
age of nursing personnel.

The promotion of better nutritional standards and the improv
ment of food habits was the responsibility of the nutrition di
sion. National campaigns in 1942 gave emphasis to populariz
enriched flour and bread, more efficient home food practices, a
improved provision for feeding families of industrial workers.

Defense Research Committee, National: *see* SCIENTI
RESEARCH AND DEVELOPMENT, OFFICE OF.

Defense Transportation, Office of.

Joseph B. Ea
man, chairm
of the Interstate Commerce commission, was appointed by Pre
dent Roosevelt, Jan. 2, 1942, as director of the Office of Defe
Transportation. The office had been created by executive ord
on Dec. 18, 1941, to "assure maximum utilization of the domes
transportation facilities of the nation for the successful prose
tion of the war."

The executive order delegated to the Office of Defense Tra
portation broad supervisory powers over railroad, motor, inla
waterway, coastwise and intercoastal shipping, pipe line and
transport. Additional responsibilities relating to rubber-bo
transportation facilities were assigned to the office by executi
order on May 2, 1942. On Aug. 5, 1942, another executive or
subjected to the agency's authority domestic transportation fac
ties in territories and possessions of the United States.

Director Eastman set up within the Office of Defense Tra
portation 12 principal divisions: railway transport; motor tra
port; local transport; waterways transport; petroleum and ot

quid transport; materials and equipment; rates; storage; transort conservation; transport personnel; traffic movement; and w.

During 1942 the Office of Defense Transportation issued more an 30 general orders, imposing restrictions of various kinds on il, water and motor carriers, for the purpose of improving oprating efficiency, co-ordinating services, conserving equipment or ccomplishing other objectives related to the general purpose of chieving maximum utilization of domestic transportation facilies in the war emergency. Numerous special orders, limited in pplication to particular transportation companies or services, lso were issued.

Office of Defense Transportation orders requiring heavier loadng of freight cars resulted in more intensive use of railroad car quipment, motive power and terminal facilities. The office acted o avert freight-traffic congestion in port areas by subjecting ovements of export freight to a permit system, by exerting ose supervision over all rail traffic movement, and by making rovision for adequate storage space at port areas and at inland oints. Various regulations pertaining to tank cars and wateraft carrying liquid cargo were issued to expedite movement of etroleum to the eastern seaboard. Controls were established ver Great Lakes shipping to expand the preferential movement f iron ore, which attained a record high volume in the 1942 ason.

To conserve railroad passenger equipment and assure an adeuate reserve of such equipment for troop movements, the Office f Defense Transportation issued a general order freezing all assenger-train schedules as of Sept. 26, 1942, and prohibiting, ith certain exceptions, operation of additional trains or extra ctions. A phenomenal rise in railroad and bus passenger traffic used the Office of Defense Transportation, in co-operation with e carriers, to initiate an extensive campaign to discourage unecessary travel by civilians. All intercity bus operations were bjected to regulation of the office on July 1. Consolidation of merous intercity bus services also was effected.

During 1942 the office established loading and routing requireents for intercity motor trucks, initiated an extensive truck nservation program, and curtailed local delivery services. Virually all trucks, buses, taxicabs and similar commercial vehicles ere obligated to obtain certificates of war necessity, prescribing ileage and load restrictions, under regulations which became fective Dec. 1, 1942. In the field of local transportation, the ffice of Defense Transportation promoted staggered-hours plans, oup riding, rerouting of buses and streetcars, and other measures conserve rubber and equipment and obtain maximum use from blic transit facilities and private automobiles. A nation-wide 5-mile-an-hour speed limit was established in Oct. 1942 by der of the agency. (*See* also ELECTRIC TRANSPORTATION; LAW; OTOR TRANSPORTATION; RAILROADS.) (J. B. E.)

e Gaulle, Charles: *see* GAULLE, CHARLES DE.

elaware. A state of the middle Atlantic seaboard, first to ratify the federal constitution (Dec. 7, 1787), opularly called the "Diamond state." Area, 2,057 sq.mi. (land, 978; inland water, 79). Pop. (1940), 266,505, of which 9,432 were urban and 127,073 rural. Native white numered 215,695; foreign, 14,913; Negro, 35,820. Capital, Dover, 517. The only larger city is Wilmington (112,504).

History.—At the end of 1942, 14,000 Delawareans were under ms, 91,000 had been registered for selective service, and 100,000 ere engaged in civilian defense. Factories in the vital Wilmingn area swarmed with workers building ships, planes and other ar products. Dimout areas and military zones were established, military vehicles replaced much civilian traffic, which declined 36.4%, and rationing of gasoline, tires, fuel oil, sugar and coffee became effective. Living costs increased; business was up 10%, food prices were up 25%, clothing 21.5%, house furnishings 13.5%, fuel and light 1.5% and housing 1.5% over the figures for 1941. Representing only .2% of the nation's population, Delawareans paid 1.6% of the total revenue collected by the U.S. treasury. Marriages in the state were 8,328 in 1942 and 6,332 in 1941.

The November election resulted in a victory for the Republican party in Delaware. C. Douglass Buck, with a majority of 7,888, replaced Senator James H. Hughes, and Earle D. Willey defeated Dr. Philip A. Traynor for representative by a majority of 6,585. Senator James M. Tunnell, Sr. (Democrat), a holdover, completed Delaware's congressional delegation. The state offices of attorney-general, insurance commissioner, auditor of accounts, and state treasurer as well as nearly all of the county offices were won by the Republicans. A Republican legislature (senate 10–7, house 24–11) was elected. The governor in 1942 was Walter W. Bacon (Republican) elected for a 4-year term in 1940.

Education.—In 1942 there were 170 elementary and 44 secondary schools with a total enrolment of 43,098 and a teaching staff of 1,714. The majority of the dislocations in the educational system caused by the war were adjusted.

Communications.—There were 3,930 mi. of highways in 1942, all under state control. Because of the war new construction was halted and all efforts were toward maintenance. During 1942, highway expenditures were $4,088,515.85, of which federal aid amounted to $708,532.52. Railroad mileage (1938) 297. Waterborne commerce (1941) 433,823 tons. Nearly all of the 10 airfields in the state had been federalized, and no statistics were available in 1942. Number of telephones (Oct. 31, 1942) 62,365.

Banking and Finance.—The 30 state banks in 1942 had resources of $303,263,875.32 and deposits of $254,699,055.04. The 14 national banks had resources of $27,649,556.92 and deposits of $21,839,587.57; the resources of the 43 building and loan associations were $14,125,309.34. The state budget (fiscal year 1941–42) was $11,465,839.08, the receipts $19,338,698.70, and the expenditures $17,644,479.96. The state's gross debt was $5,048,000 and the net debt $5,010,204.16.

Agriculture.—All crops in 1942 were valued at $14,422,000. Cash income in 1942 from crops was $9,202,000 (Jan.–Sept.); from livestock $29,540,000 (Jan.–Sept.); from government payments $660,000 (Jan.–June).

Table I.—*Leading Agricultural Products of Delaware, 1942 and 1941*

Crop	1942	1941
Corn, bu.	4,384,000	3,925,000
Apples, bu.	928,000	1,794,000
Hay, tons	93,000	90,000
Wheat, bu.	1,281,000	1,332,000
Tomatoes, tons	55,500	39,000
Strawberries, crates	110,000	110,000
Lima beans, tons	9,320	8,680

Manufacturing.—The total estimated value of manufactures as of Oct. 31, 1942 was $224,436,999.53. Earnings of 46,779 persons engaged in manufacturing was $97,045,532 (year ending Sept. 1942).

Table II.—*Principal Industries of Delaware, 1942 and 1941*

Industry	Value of Products	
	1942	1941
Chemicals	$17,627,502.30	$9,772,637.00
Shipbuilding	17,652,483.42	4,429,668.00
Foundries, machine shops, tools	38,759,988.04	13,509,034.00
Leather	7,469,668.74	9,710,129.00
Fibre	16,362,262.83	11,836,083.00
Textiles	15,641,112.39	12,800,915.00
Canning and packing	2,842,834.80	5,065,134.00

Mineral Production.—The chief products are granite, building stone, brick and clay products with a total value of $325,673.19 (year ending Oct. 31, 1942).

Bibliography.—Wm. S. Dutton, *DuPont One Hundred and Forty Years* (1942); J. S. Gould, *Delaware Income Statistics . . . 1936, 1937, and 1938* (1942); *Delaware Church Directory* (Hist. Records Survey & Public Archives Comm., 1942). (L. D. V.)

De Lee, Joseph Bolivar (1869–1942), U.S. physician, was born Oct. 28 at Cold Springs, N.Y. He studied at the Chicago Medical college and at schools in Vienna, Berlin and Paris, where he specialized in obstetrics and gynaecology. In 1895, Dr. De Lee established a maternity hospital in a Chicago slums area. This centre, the Chicago Lying-in hospital, became world famous, and by 1942 was caring for more than 3,000 expectant mothers each year and training 300 medical students annually in obstetrics. The great $2,000,000 Chicago Maternity centre, also founded by Dr. De Lee in 1932, had its inception in the obstetrician's earlier charity service. Dr. De Lee, who taught obstetrics at Northwestern university, 1897–1929, was chairman of the obstetrics department of the University of Chicago, 1929–32 and continued at the latter school as a professor until 1934, when he retired. His contributions to operative method, obstetrical instruments and hygiene were widely adopted throughout the United States. He also produced a number of motion pictures illustrating approved procedure in obstetrics and gynaecology.

Among his works are *Obstetrics for Nurses* (1904) and *The Principles and Practice of Obstetrics* (1913). Dr. De Lee died in Chicago on April 2.

Deming, Edwin Willard (1860–1942), U.S. artist and sculptor, was born Aug. 26 in Ashland, Ohio. He went to Chicago in his youth to study business law, but left after three months, and later went to study at the Art Students' League in New York. From there he went on to Paris to work under Boulanger and Le Favre at the Julien academy. Upon his return to the United States, he went west to live and study among the Indians. His oil paintings and bronze sculptures of Indian and animal life won many honours and were hung in various museums throughout the country, including the Metropolitan in New York and the National museum in Washington. His "Landfall of Jean Nicholet" was selected by Wisconsin as the design for a federal postage stamp to commemorate Wisconsin's tercentennial. He died at his home in New York city, Oct. 15.

Democracy is not only a technique of government, based upon freely elected representative institutions, and upon an executive responsible to the people; it is based upon the belief of the equality of all individuals and of the equal right of all to life, liberty (including the liberty of thought and expression) and the pursuit of happiness. The denial of this equality and of individual liberty, the proclamation of authoritarianism and of the inequality of men and races as a "new order," is characteristic of fascism, which arose as a conscious and aggressive world-wide opponent of democracy.

This world-wide threat to democratic freedoms and institutions led to a widespread reappraisal of the principles of democracy and a reassertion of faith in them. The war aims of the United Nations stress the need for maintaining and spreading democratic principles. While the initial successes of fascist Germany in 1939–40 and of fascist Japan in 1941–42 had produced a growing conviction of the weakness of democracy, especially in the field of military efficiency, the turn of events at the close of 1942 made it clear that this alleged superiority was only due to more protracted preparedness of the fascist powers and that the democracies were able in an astonishingly short time to catch up wit the fascist powers and to prove their equals in the field of warfare. At the same time democratic liberties were everywher maintained in democratic countries in spite of the pressure o war exigencies. It may be said that the war acted as an activ agency for greater democratization in removing class barriers i Great Britain and racial disabilities in the United States. I countries under German domination resistance was everywher on the increase. This was brought about not only by the sufferin and starvation which the occupation brought in its wake, and b the ruthless policy of persecution, humiliation and exterminatio followed by the Germans; it was also the result of the growin faith in democracy and its final victory. The same faith could b noticed in all Latin American republics with the exception o Argentina and Chile.

A NEAT DEFINITION OF DEMOCRACY in terms of baseball, by George Clar of News Syndicate Co. Inc. The private to the captain: "Whatta ya mean, he' out? He was safe a mile!"

The trend was even more marked in the few remaining neutra countries of Europe. Elections held in Sweden during 1942 resulted in the elimination of the insignificant national socialis party and in the complete triumph of strong democratic partie The German propaganda minister protested again and again a the outspoken democratic sympathies of the Swiss and th Swedish press, which were the more remarkable for the fact tha the two countries were on all sides surrounded by the ove whelming power of national socialist Germany. Turkey, to reasserted in 1942 her loyalty to democratic principles in a mor emphatic way than she had done in 1941. (*See* also Communism Education; Fascism; Great Britain; United States; Unio of Soviet Socialist Republics.)

emocratic Party. As it entered 1942, the Democratic party continued in control of the ecutive and legislative branches of the national government. 7hen the 77th congress convened for its second session on Janu y 5, the Democrats held 66 senate and 262 house seats. Edward Flynn of New York remained as chairman of the Democratic ational committee throughout the year. In the house, Repre ntative Sam Rayburn of Texas held office as speaker, with Rep sentative John W. McCormack of Massachusetts as floor leader. the senate, Alben W. Barkley of Kentucky continued as ajority leader.

Responsibility for directing U.S. participation in World War II, in World War I, rested with a Democratic administration. Fol wing Pearl Harbor, a unified congress began the job of shaping e greatest military program in U.S. history. Republicans co erated with the Democrats in securing the speedy enactment of e war measures through which the nation gave its answer to e challenge of the axis.

In January congress passed the Price Control act, one of a ries of measures aimed to put the national economy on a war ne basis. On March 27, in the Second War Powers act, it rein rced the unprecedented emergency powers vested in the presi nt on Dec. 16, 1941, and on March 28 it raised the national bt limit from $65,000,000,000 to $125,000,000,000. On June 5 approved declarations of war against three axis satellites, Ru ania, Hungary and Bulgaria. Other important measures ap oved were the 1942 Revenue act, providing a $9,000,000,000 in ease in taxes; legislation creating new women's corps in the med services; a bill lowering the draft age from 20 to 18; and e emergency anti-inflation act of Oct. 2, giving the president eeping authority to control wages and salaries and combat infla on through economic stabilization.

A bill vesting in the chief executive the power to suspend, for e duration of the war, certain provisions of the tariff and immi ation statutes was the only major administration measure that iled of enactment during the 1942 session. Action on this legis ion was postponed until the next congress. A senate filibuster evented enactment of a house-approved bill outlawing poll taxes southern states.

Though prosecution of the war was the chief concern of the ministration, the year saw a good deal of activity on the politi l front at home. On Feb. 2, Chairman Flynn of the Democratic ational committee declared, "No misfortune except a major litary defeat could befall this country to the extent involved in e election of a congress hostile to the president." Mr. Roose lt, four days later explained that what the country needed when war was congressmen irrespective of party, who would support e government, and had a record of supporting it in the emer ncy. Unlike Woodrow Wilson, who warned the country in 1918 at a Republican majority in congress would be interpreted as a udiation of his leadership. President Roosevelt, in the 1942 mpaign made no direct plea for the election of Democratic ngressmen.

The president, however, intervened in New York State, by an uncing his support of Senator James M. Mead for the Demo atic gubernatorial nomination. Attorney General John J. Ben tt, Jr., who had the backing of State Chairman James A. Far , won the party's nomination, after a bitter preconvention fight at further widened the cleavage, among New York Democrats, tween New Dealers and Anti-New Dealers. Bennett was de ated by Thomas E. Dewey, the Republican candidate for gov nor, by more than 600,000 votes.

Reflecting popular dissatisfaction with the administration's conduct of the war, and some of its domestic policies, the national elections on Nov. 3 reduced the Democratic majorities in congress to the lowest point since President Roosevelt entered the White House in 1933. In the new house the Democrats held 222, and in the new senate 57 seats. (*See* also ELECTIONS.)

Charles Michelson, director of public relations for the Democratic National committee since 1929, resigned his post soon after the November elections. The committee took steps to curtail its headquarters organization, explaining to its employees that in view of the fact that there would be no national election until 1944 "it is not deemed wise nor patriotic to continue our efforts to raise substantial sums of money."

The Republicans scored the bulk of their 1942 gains in the mid-western states. Democratic leaders from 10 of these states met at Omaha, Neb., on Dec. 11, and following the meeting announced formation of a permanent organization whose declared purpose was "to assist our great commander in chief in winning this war, and also to strengthen and better serve the middle western agriculture states."

Though the Democrats, in the new congress, still commanded a majority in both houses, their control, particularly in the lower chamber was only nominal, for the Republicans, with a few Democratic votes, could exercise a veto over administration measures.

(O. McK.)

Denmark. A monarchy of north central Europe. Area, 16,575 sq.mi.; pop. (est. 1940) 3,844,312. Capital: Copenhagen (890,130). Other principal cities: Aarhus (99,881); Odense (85,521); Aalborg (55,652). Religion: Lutheran Christian. Ruler in 1942: King Christian X (*q.v.*); prime minister: from 1929 to May 3, 1942, Thorvald Stauning (*q.v.*); May 3–Nov. 2, Vilhelm Buhl; after Nov. 8, Erik Scavenius. On April 9, 1940, Denmark submitted to German military occupation.

History.—Encouraged by the opposition to Germany in Norway, by the growing strength of Britain, by the heroic resistance of the Russians, by the entry of the United States into the war, the peace-minded Danes had become implacable and effective foes of their nazi masters by 1942.

The repeated illnesses of King Christian and the death of Premier Thorvald Stauning (May 3) intensified the uncertainties of Danish politics. The king, fortunately for Denmark, lived to stimulate hope in the future, and to resist successive encroachments on Danish sovereignty. On the death of Stauning, a man too popular to be removed, the Germans undoubtedly hoped to capture the administration. But the Danish ministry moved too swiftly, and made their own choice of a man who would follow a truly Danish policy—Vilhelm Buhl. Under the Buhl administration, opposition to Germany continued to grow. Christmas Möller, whom the nazis had forced from the Cabinet late in 1940, had just escaped from Denmark to England, where he soon became chairman of the Council of Free Danes. Sabotage developed, illegal papers such as *Frit Danmark, Land og Folk, De Frie Danske,* began to flourish, and the would-be nazi movement led by Frits Clausen made no headway. Danish exiles claimed 98% of their countrymen were anti-nazi. A widespread movement of democratic nationalism among the youth of the country was inspired by the young theology professor, Hal Koch.

On Sept. 29, the "too humane" German commandant, Gen. Luedtke, was recalled to Berlin and Gen. Hermann von Hanneken, a man supposedly trained in German "war economy," was sent to Denmark. Likewise, the gestapo-trained Dr. Werner Best was sent as the new minister to Copenhagen. Toward the end of October the nazis decided to go still farther; they called to Berlin the collaborationist minister of foreign affairs, Erik Scavenius—he who a year before had angered the Danes by signing the anti-Comintern pact. Scavenius was told that by Nov. 8 Denmark must form a new ministry in which Germany "could have confidence." After consultation with a special parliamentary commission, the government decided late on Nov. 7 to yield, and the king, from his sickbed, agreed. Buhl resigned, and Scavenius became head of a new ministry which promised co-operation but in whose formation the Danish nazis had no part. Among other German demands were: 150,000 workers to go to Germany; all the remaining small ships to be given up; anti-Semitic laws on the German model to be introduced. About Dec. 1 it was reported that the Germans demanded the disarming of the Danish army, partly so that they could use some 100,000 rifles and 3,000 horses.

Outside Denmark the nationals of the country became increasingly active in 1942. No government-in-exile had been formed, but the Danish council in London, acting with the Danish envoy Count Reventlow, and the National America Denmark association in the United States, acting with the Danish Minister H. de Kauffmann, represented Free Danish interests. Among other things, de Kauffmann maintained interest payments on Denmark's dollar loans.

Education.—In 1940 there were 407,355 students in the elementary schools and 67,064 in the middle and secondary schools. In the two Danish universities 6,474 students were enrolled.

Defense.—Budgets for purely military expenses were as follows: 1938–39, 33,635,000 kr.; 1939–40, 84,494,000 kr.; 1940–41, 62,663,000 kr.; 1941–42, (est.) 28,855,000 kr.

Economic and Financial Conditions.—Denmark, a rich agricultural country, was not starving in 1942. In fact, several thousand German women and youth were sent there to gain health. Yet conditions were bad. Tuberculosis, normally 1.7% among school children, was reported by the Danish radio to be 3.98%. No textiles could be manufactured with more than 20% wool. Milk production was down 37% by April 1942. Railroad rolling stock was taken to help supply the eastern front. Fue shortage was so great that some smelters had to close down, an local peat and lignite production increased elevenfold to try t meet part of the need.

Most significant of all in the deterioration of Danish econom was the reduction of livestock by slaughter, due to lack of fodde and "other reasons": 15–20% decline in cattle; 60–65% declin in hogs; 65–70% decline in chickens.

Danish economy was of course yoked to nazi requirements i 1942; 80% of the exports went to Germany.

Payment was in kind and in promises; it is noteworthy tha the German debt to Denmark, about 38,000,000 kr. before th war, had risen to 1,700,000,000 kr. by the beginning of 1942.

PLAN FOR A "GREATER GERMANY"
DENMARK
ALEXANDER

"SOMETHING ROTTEN." Denmark, no less than the other parts of nazi-occupied Europe, did not relish the odour of the new order in 1942, according to Alexander of the Philadelphia *Evening Bulletin*

Dentistry.

By Dec. 1942, more than 15% of all dentists engaged in private practice, in hospital service or i teaching were on duty with the armed forces. This dislocation o dentists from civilian activities naturally necessitated many read justments, particularly in the faculties of dental schools. Ne courses in war surgery had to be developed with reduced staffs In addition, the accelerated program of dental education, in whic the four-academic-year course was reduced to three calenda years, by giving up the summer vacations, required importan readjustments in the curriculum.

Readjustments in private practice also became necessary, i order that the civilian population, including industrial workers might have at least the dental care necessary to enable them t keep at work.

In May 1942 a group of research workers and clinicians met t analyze the knowledge of the causes and methods of control o dental caries. The discussions emphasized both the importance o early care and treatment and of nutrition, especially the reduction in the diet of carbohydrates, including the fermentabl sugars. But standing out somewhat in bold relief, as a possibl mass means of reducing the prevalence of dental caries, was th part that fluorine and the fluorides in drinking water play in developing immunity to this disease.

Interesting reports were made during the year by dental officer in the United States public health service, regarding their examinations of large numbers of school children in areas wher there was no fluorine in the drinking water, and in areas where th drinking water contained more than .5 parts per million. In th towns and cities examined where the water contained less than . parts per million, the usual prevalence of dental caries was foun —that is, 98% of all the children. In communities with .5 part per million up to 2.5 parts per million, only 25% of the childre were found to have any dental caries. These findings were o tremendous significance.

In round figures the evidence suggests that in quantities belo .5 parts per million, fluorine apparently has no inhibitory actio Above 2 or 2.5 parts per million, it produces changes known a mottled enamel and hypoplasia of the tooth structure. Suc mottling and hypoplasia were produced experimentally in teeth o rats by feeding of potassium fluoride. MacKay showed that thi mottling does not increase the susceptibility to caries, but it doe influence unfavourably the appearance of the teeth. In one community where there had been an increase of the fluorine conten from .2 parts per million to .7 parts per million, over a two-yea period, there was no reduction in the prevalence of dental carie in school children whose teeth had already been formed, althoug one group of investigators concluded that small additions c fluorides to the drinking water delay the onset of caries to greater extent than improvements in the diet. It appeared to b necessary to have the child use the drinking water in the ver arly periods of life, during the calcification of the teeth, to have his immunizing effect to caries.

Two contributions to the therapy of dental infections were enicillin and gramicidin. Penicillin, produced by a mould (*Peni-illium notatum*), appears to be a potent bactericidal agent—ore potent even than the sulphonamides. It completely inhibits acterial growth and is not inhibited by tissue autolysates. It was sed successfully in osteomyelitis, which made this remedy of articular interest to dentists, for osteomyelitis of the jaw is a rious and obstinate disease. Its value was further suggested by e fact that it proved valuable in infection which did not respond the sulphonamide treatment or to surgery.

Gramicidin, derived from an earth bacillus (*Bacillus brevis*), peared to be equally potent as a bactericidal agent, but, except r the *Streptococcus faecalis,* penicillin seemed to be the more tive, especially in pyogenic conditions. Both have an advantage ver the sulpha drugs, in that they are much less toxic in their tion.

In the treatment of war injuries of the face and jaws, which ere becoming numerous, two books were of considerable value. manual developed by a committee from the division of medical iences of the National Research council, entitled, *Manual of andard Practice of Plastic and Maxillofacial Surgery,* is designed meet the needs of modern warfare, and a *Synopsis of Trauma- Injuries of the Face and Jaws,* by Douglas Parker of Colum- a university, presented by the author as "a concise text that ould deal with the early first-aid treatment of face and jaw in- ries at the site of injury."

ermatology. Pardo-Castello and Ferrer wrote an excellent summary of the current conception of pinta, sed on the discovery of the causative spirochaete, and the work Leon Blanco, who demonstrated the presence of primary and condary lesions (previously unrecognized). Pinta can be inoculed in man. It is a separate disease from syphilis. Pinta is obably transmitted by personal contact, the existence of a ctor being doubtful.

Dostrovsky and Sagher, in Palestine, used grenz rays with cellent results in the treatment of 72 cases of oriental sore. In cases, the disease was of the unusual, recurrent type, which d previously been considered entirely rebellious to treatment.

The occurrence of oriental sore in the United States and Canada s discussed by Dwork, who collected 28 cases from the litera- re and described 4 additional ones. In no case was the disease ntracted in the western hemisphere.

Chromoblastomycosis in Cuba was discussed by Pardo-Castello, o Leon and Trespalacios on the basis of a study of 32 cases. ve clinical types were described. The difference in their appearance was apparently due to difference in allergic reactivity, as the same organism, Fonsacae pedroisi, was found in 11 cases. Roentgen therapy was recommended for the superficial type and electrocoagulation for the extensive, unfiltered types.

In an exhaustive article with innumerable illustrations, Sutton, Jr., discussed cutaneous epithelioma, its manner of growth and a histologic study of whole tumour sections. "Progressive cancerization" at the edges of the lesion was considered a misinterpretation of histologic data, which reveal abnormal cells only in juxtaposition to normal ones, undermining, replacing and engulfing them. He found no evidence of conversion of normal into cancerous cells. Malignancy was considered to be intimately related to cohesion of cells and their rate of growth. Each spontaneous epithelioma behaves like a colony of cells of a new type. Perhaps, he thought, this comprises the homogeneous progeny of one mutant cell.

Balog described a hitherto unreported dermatosis, observed in Egypt under the title of "benign embolic pyemid." It is an acute staphylococcic infection, in which a primary focus is followed by repeated pyogenic metastases. The lesions are semiglobular, with an umbilicated necrotic centre. They appear in crops, and heal within one or two weeks, indicating their benign nature.

So-called nummular eczema was considered by Gross to be an entity. He attempted to show that dryness of the skin was a predisposing cause. As this is an early sign of vitamin A deficiency, therapeutic studies with vitamin A were made and showed favourable results.

In a study of hyposensitization to poison ivy, Shelmire treated 20 patients sensitive to the plant, by ingestion for several months, with dilutions of poison ivy oleoresin in corn oil. Quantitative patch tests before and after treatment showed varying degrees of reduction of sensitivity. There was no reduction in untreated controls.

A preparation of sulphonated oil was used by Lane and Blank for a year, in 183 patients in a dermatologic ward. This remedy was non-irritating for the great majority of patients for whom soap was contraindicated. It proved to be a more satisfactory detergent than liquid petrolatum, olive oil or colloid baths. Only one patient showed an apparent hypersensitivity to the oil.

Jolliffe, Rosenblum and Sawhill found that the oral administration of pyridoxin (vitamin B) improved the skin of some patients with postadolescent acne vulgaris. Many patients showed a decided reduction in the oiliness of the skin to the point of actual drying and scaling.

In the treatment of senile pruritis with androgens and oestrogens, Feldman, Pollock and Abarbanel found that these hormones acted specifically in each sex. The treatment was not curative, but exerted favourable effects by maintenance doses in persons with a deficiency of the endocrine factors. (*See* also Industrial Health; Medicine.)

ASSEMBLY BAY of Willow Run, Henry Ford's huge bomber plant in Detroit, completed in 1942. In this bay is an assembly line half a mile long

D'Espérey, Franchet: *see* ESPÉREY, FRANCHET D'.

Detroit. Fourth largest city of the U.S.A., in Wayne county, Detroit is the centre of the large industrial area of southeastern Michigan. Area, 137.9 sq.mi.; pop. (1940) 1,623,452; estimated (July 1, 1942), 1,807,000. Foreign-born white, 320,664, of whom 110,698 were British and Canadian; 52,235 Polish, ranking second. Assessed value as of July 1, 1942, $2,724,495,430; gross bonded debt as of Dec. 31, 1941, $354,056,239, which included $117,652,739 of utility debt; net debt, $230,900,152 excluding all utilities; gross city appropriation, fiscal year ending June 30, 1943, $159,698,051 including utilities; tax levy, city and school purposes, $78,944,980; combined tax rate $28.98. Mayor, Jan. 1, 1943, Edward J. Jeffries, Jr.

The difficulties anticipated in the curtailment of automobile production and the change-over to defense activities during 1941–42 did not materialize to any serious extent. The rapid conversion of existing plants and the construction of new ones in Detroit and its environs devoted almost exclusively to war work made the Detroit area the most important arsenal of America. Volume, dollar production and numbers employed, though totals were not announced, evidently greatly exceeded any previous records. Unemployment ceased to exist, and relief rolls reached a low for the decade.

Increased population in the industrial area (336,000) created acute housing problems for Detroit and adjacent cities which were scarcely affected by the several federal housing projects. Transportation difficulties were complicated by the lack of any system of rapid transit and the corresponding reliance of Detroit workmen on private automobiles. The municipal transportation system in 1942 was struggling against inadequate equipment and scarcity of manpower.

No major labour difficulties occurred during 1942, but numerous "wildcat" strikes on a small scale continuously persisted, one for three days in the transportation system. Threatened strikes of other public employees were cancelled after the U.S. declaration of war in 1941.

In the political field, the investigation of public graft, begun in 1941, continued, particularly in the county government, and resulted in the conviction of two members of the principal executive board and the removal of the third. Several convicted city councilmen and numerous police officers were serving sentence but the convicted mayor, sheriff and prosecutor were still at liberty on appeals in 1942. Attention centred on Circuit Court Judge Homer Ferguson, in charge of the investigation, and resulted in his election to the U.S. senate replacing Democratic Senator Prentiss M. Brown. However, efforts to completely reorganize the county government failed in a state-wide vote on the necessary amendment to the constitution.

The financial condition of the city continued to improve in 1942. All outstanding bonds were refunded at much reduced rates of interest. The long standing operating deficit was eliminated and the city concluded its fiscal year with a substantial surplus.

(L. D. U.)

Dewey, Davis Rich (1858–1942), U.S. economist and educator, and brother of John Dewey was born April 7 in Burlington, Vt. Prof. Davis, a member of the faculty of the Massachusetts Institute of Technology for nearly 50 years, was head of the department of economics and statistics from 1930 until his retirement as professor emeritus in 1933. He died in Cambridge, Mass., Dec. 13. (See *Encyclopædia Britannica.*)

Diabetes. Diabetes in the year 1900 was 27th as a cause of death in the United States, but in 1940 it was eighth, with 26.6 per 100,000, 35,015 cases, which represented the peak figure up to that year. The rates for 8 of the 10 larges cities in the United States in 1941 were still higher, the exceptions being Detroit and Los Angeles, and ranged per 100,000 from 31.1 (Chicago) to 40.7 (New York). Between 1935 and 1940 the United States rate rose both actually and proportionally less than that of these cities. Therefore it was good news to learn that in the year 1941 a halt took place in the rising city incidence and in 13 of the 15 larger cities in the United States the diabetes death rate was actually lower than in 1940. Figures for the Metropolitan Life Insurance company likewise fell in 1941 from their peak in 1940 and were still below that peak for the first ten months of 1942.

The duration of the disease in fatal cases in one large clinic advanced from 4.9 years between 1898 and 1914 to 14.3 years for 1940 to mid-1942 and the percentage surviving the disease 20 years rose correspondingly from 1.8% to 19.2%.

The causes of death of diabetics altered. Up to the year 1914 betic coma (acidosis) ultimately claimed 64% of those with the ease but after 1940 only 3.3%. Recovery from actual diabetic na was almost unknown before the discovery of insulin but, h its use, gradually declined and in one series of 73 successive tances, based on values of CO_2 20 volumes per cent or below, re was no fatality. Diabetics succumbed most frequently to eriosclerosis in its various forms, in the arteries of the legs, in and kidneys. Although it remained a major complication diabetes, the meticulous training of the patient reduced the rtality from gangrene, due to hardening of the arteries in the s, from 8.5% for the years 1922–29 to 4.7% during 1937–40 pite the average age of the patients having risen fully five rs and their exposure to the disease having been half again as g. Studies upon diabetic children who had withstood diabetes or more years indicated that 30% of those examined roentgeno- ically had peripheral arteriosclerosis and 55% had moderate to anced ocular arteriosclerosis. As these children developed dia- es before the discovery of insulin, future series of cases should r a more hopeful outcome.

The sulphonamides proved to be as helpful and lifesaving in ctions in diabetics as in nondiabetics. Insulin is capable of ducing anti-insulin antibodies and insulins derived from vari- animal sources are immunologically identical. Allergy to in- in can exist in the absence of resistance to insulin and re- ance can exist in the absence of allergy. Desensitization to ulin is feasible but as yet no cure to insulin resistance is known, fortunately it is self-limiting. For the first time, in 1942, s with radioactive insulin made it plain that in some cases resistance to insulin the subcutaneous tissues do not permit normally rapid absorption.

Diabetes was considered a cause for a rejection of men for the ny and navy and wisely so. The difficulty of selection of those betics physically capable, the possibility of increase in se- ity of the disease, the difficulty of always assuring proper diet, necessity for a soldier's restudy whenever transferred from np to camp or when hospitalized even for a trivial ailment. pled with the necessity for the government to provide for ir future, justified their rejection. Moreover, statistical esti- tions and a clinical survey placed the number suitable for the ned forces as relatively insignificant, with 4,500 men as the up- limit and 1,800 as the lower.

The exceptional value of the contributions of the Argentine siologist Houssay to the relation of the anterior portion of pituitary gland to the pancreas during the decade still bore it by opening up the way to many fresh discoveries. Of first ortance was Young's production of diabetes by repeated injec- ns of extracts of the anterior pituitary gland of beeves into a , thereby causing destruction of the islands of Langerhans of pancreas in which insulin is produced. This was confirmed, ticularly in Toronto. Later Lukens and Dohan in the Cox tabolic institute in Philadelphia demonstrated that in the cat s experimental type of diabetes could be cured. They con- ded, ". . . we have noted the fact that pancreatic lesions are duced by partial pancreatectomy or pituitary extract only in ociation with hyperglycaemia. In like manner, the recovery of islands is coincident with the return of the blood sugar to mal levels prior to irreversible damage to the islands, whether s is accomplished by insulin, dietary treatment or phlorhizin. ese findings support the hypothesis that the level of blood cose is not only an index of the regulation of carbohydrate tabolism but also that it has, directly or indirectly, an influence the islands of Langerhans. This influence is pathogenic when blood sugar is high and beneficial when hyperglycaemia is trolled, provided the lesions are not irreversible."

The above experimental evidence confirmed Naunyn's clinical view published soon after the turn of the century, "that the diabetes immediately at its first appearance be so energetically treated that, if possible, the glycosuria will be abolished."

Diamonds.

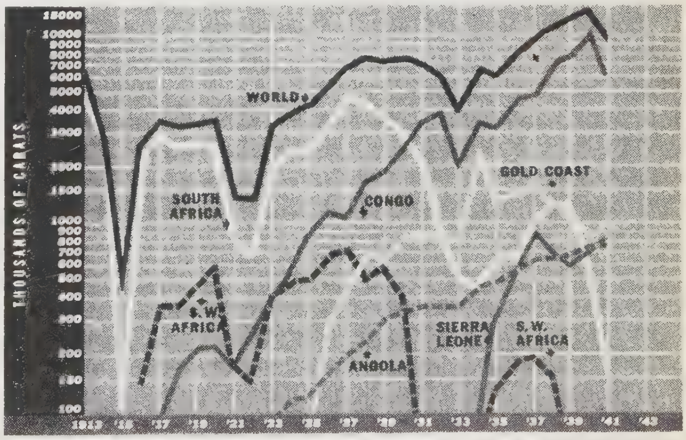
The world production of diamonds from 1937 to 1941 is shown in the table on p. 236; few official reports of output were made during 1940 and 1941, and many of the figures used in the table are the estimates of S. H. Ball in *Minerals Yearbook*.

Operation of the South African mines was discontinued after Sept. 1940, but alluvial workings both there and in South-West Africa were continued, though on a reduced scale. In general, operations were restricted in areas where gem stones predominate in the output, but where industrial stones are in the lead, production was maintained as high as circumstances would permit.

Following the disruption of the European cutting trade, with the German occupation of Belgium and Netherlands, the smaller cutting centres in other countries were enlarged, especially in the United States, South Africa, Great Britain and Palestine. Hence, as a by-product of the war, we now find New York city the chief diamond cutting centre of the world.

Imports of diamonds into the United States were reported only for the first nine months of 1941, but it is evident that the amounts of all types of stones decreased materially; for figures, see the article on GEMS AND PRECIOUS STONES. Rough stones were received only from South Africa and Brazil, the former decreasing heavily, and the latter increasing. Receipts of cut stones credited to European sources were somewhat higher than might have been expected under the circumstances, but this may possibly be explained by the fact that many of the stones evacuated from the occupied areas were sent to Bermuda, and it is from this stock that much of the recent United States imports have been drawn; that being the case, under customs regulations, Bermuda would be considered a port of trans-shipment, presumably, and the country from which the stones came would be credited with their origin.

Receipts of industrial diamonds were at a rate somewhat less than the average of 1940, though this may have been offset by larger shipments in the last quarter. Most of these came from South Africa, but receipts from Belgian Congo were expected to increase, since shipment and sales of these stones were again



DIAMOND PRODUCTION OF THE WORLD and the major producing countries as computed by *The Mineral Industry*

arranged, after having been discontinued for about a year after the occupation of Belgium. (G. A. Ro.)

Diatomite. The diatomite production of the United States was estimated to have been about 114,300 long tons in 1941; this is about one-third of the total world output, and Denmark is the second largest producer, with an output somewhat less than that of the United States. The remaining output comes from a large number of minor producers, only a few with outputs over 10,000 tons. (G. A. Ro.)

Dictatorships: *see* COMMUNISM; FASCISM; GERMANY; ITALY; JAPAN; RUMANIA; SPAIN; UNION OF SOVIET SOCIALIST REPUBLICS.

Dietetics. In time of war, governments become aware that health and vitality are weapons and that food research aids the war effort.

Experience in food controls in the warring countries makes possible some evaluation of war diets.

Anaemia, which appears dietary in origin, was reported increasing in Great Britain, among hospital nurses at base hospitals in the country and among children in residential nurseries. Greater watchfulness over the adequacy of institution diets was suggested. Results on the growth of children were conflicting, with London 14-year-olds applying for post office positions, being at least as heavy as those in 1938, whereas Milligan's comparison of four groups of Glossop schoolboys showed significant reduction in rate of weight increase and probably of height as well, which became most noticeable following strict rationing.

Studies of vitamin C in 1941 indicated that boys living in good institutions had lower reserves on unsupplemented wartime diets than in 1938 and the same was true, in the winter, for schoolboys living at home, research workers and medical students.

Investigators suggested more use of potatoes and greens in winter.

Potatoes can be grown locally and yield half again as many calories per acre as wheat. One pound of potatoes daily, before midwinter, contains at least 10% of the calories, 25% iron, 50% thiamin and almost double the vitamin C requirement of a man. A nutritionally desirable food in the United States was the white flour which was enriched by the addition of thiamin, niacin (nicotinic acid) and iron.

Fewer complications of pregnancy, lower infant mortality and better babies at six months reward the women who have good diets, according to Ebbs. Such diets were obtained by most of the women in his clinic who received special nutrition instruction or dietary supplements and their advantage over the poor diet group was clear-cut.

Breese reported that vitamin A is not readily absorbed by tuberculous patients, which observation supports the practice of increased vitamin A for them.

The sensitiveness of vitamin C to oxidation made it a major problem in wartime food supply. With shortages of the conventional sources, man ferreted out others, such as rose hips, black currants, edible peppers, and parsley all much richer than citrus fruits.

Thiamin has long been called the antineuritic vitamin, yet Wintrobe reported no nerve lesions in a pig suffering from thiamin deficiency. Instead, in this animal, anorexia and vomiting terminated in sudden death, with the autopsy showing focal necrosis of the heart muscle the only characteristic lesion. Wintrobe and his associates reported nerve degeneration, in these experiments in the animals deprived of both calcium pantothenate and pyridoxin. In addition to abnormal gait the pyridoxin-deficient animals developed epileptiform convulsions and anaemia; when th pantothenate alone was lacking the added condition was subacute inflammation of the colon. The similarity of thes symptoms and those of Wilder's thiamin deficient human subjects suggest the nerve symptoms previously attributed to thiami may be associated with other B vitamins in man also.

Many people need to change their eating habits in order t obtain a diet adequate for buoyant health. Recognizing that, i addition to the economic problem, the traditional food pattern o a group determines food intake, the Committee on Food Habits o the National Research council was organized to suggest method of modifying food habits in order to raise the nutritional statu of people in the United States. (*See* also VITAMINS.)

Scientific Nutrition in Great Britain.—Work done before th war on the broad relationships between health, food, agricultur and economic policy under the auspices of the League of Nation prepared the way for the scientific food plan which became essential in Great Britain under the threat of acute general shortag

Britain's food policy which resulted in the level of nutrition o the whole being better than before the war, was planned wit regard, on the one hand, to the most recent knowledge of nutritional requirements and, on the other, to the organization o food production and distribution, and to the regulation of import with prices adjusted so that even the poorest should be able t obtain at least their minimum nutritional requirements. At th end of 1942 there was much evidence of the operation of thes plans. For security reasons details could not then be disclosed an the outline of the steps which led up to the system of nationa housekeeping at the beginning of the fourth year of war must b regarded as a personal interpretation of the course of events.

The various main nutrients required for all sections of the population first had to be worked out on a per head per day basis, th primary aim being to supply sufficient food to protect the consumer in ordinary circumstances against the development of nutritional deficiency disease. The nutritional requirements generall accepted in Great Britain were those agreed on by the technica commission on nutrition of the League of Nations health organization which are lower than those of the food and nutrition boar of the National Research Council of America. The first call o any supplies available in excess of reasonable requirements wa

Foodstuffs in the Wartime Dietary of Great Britain Arranged in Order of the Importance of their Contribution to the Supply of Various Nutrients (Cols. 1 to 8) and of their Menu Value (Col. 9)

Energy	Protein	Vitamins				Minerals		Value in the presentation of meals
		B-group	C	A and D	Pro-vitamin A	Calcium	Iron	
ational flour ereals (other than wheat) ats and oils otatoes gar	National flour Milk (all forms) Pulses Meat Cheese Fish Vegetables	National flour Milk (all forms) Potatoes Cheese Meat Pulses	Greenstuffs Potatoes Homegrown fruit	Margarine (fortified) Butter and milk fat Milk (except skimmed) Cheese Animal livers Concentrates (for children)	Greenstuffs and carrots	National flour Milk (all forms) Vegetables Cheese	National flour Greenstuffs and potatoes	Meat Sugar Fats Milk Beverages Cheese Vegetables Eggs Fish Fruit (including dried)

en to infants and children, pregnant and lactating women and
er special classes. The individual's requirements of nutrients
n had to be translated into terms of actual foodstuffs taking
o account the seasonal supplies, food preferences and the need
variety in the diet.

The extent to which the food required could be supplied from
ne production was necessarily the first consideration. Foodstuffs
direct human consumption, *i.e.* cereals, root crops and vegeta-
s, require less land and labour to produce than animal food
ducts such as meat, milk and eggs. In 1938 37,000,000 tons
"dry matter" were fed to the livestock of Britain; they pro-
ed only 1,500,000 tons of food for human consumption—an
r-all efficiency of only 4.1%. Competition for food between
estock and the human population had therefore to be avoided
l the numbers of livestock adjusted so that they were comple-
ntary, *e.g.*, pigs and hens should only be maintained as scaven-
s; cattle which utilize foodstuffs not suitable for man can be
ported to some extent and of these dairy cows should have pri-
y because of the special nutritional value of milk and the
tively high efficiency of milk production.

The second step was to decide on the most suitable foods for
port having regard to supplies, shipping and routes available,
gth of haul and the need for refrigerated shipping. For ex-
ple, before World War II Great Britain's imported food-
ffs included some 3,000,000 tons of water, chiefly in fresh
it; but vegetables, especially greenstuffs and potatoes, can sup-
nutrients previously obtained from imported fruits. It ap-
red that there might be insufficient supplies of vitamin A or
precursors owing to lack of butter and the effect of the war at
on the production of fish liver oils; but carrots are a good
rce of vitamin A precursor yielding per acre ten to 100 times
much as greenstuffs of various kinds. Furthermore, carrots can
stored and are relatively immune from damage. The home pro-
tion of carrots as well as of green vegetables and potatoes
s therefore considerably increased as the import of butter was
uced and of fresh fruits virtually stopped.

The lack of necessary good quality protein and members of the
complex of vitamins likely through reduced supplies of animal
d products was made good by the substitutions of national flour
white flour. The national flour was milled by methods de-
ned to extract the maximum amount of nutrients directly avail-
e for man from the wheat berry, leaving indigestible material
cattle fodder.

The inefficiency of animals in converting feeding stuffs into
ducts for human consumption clearly pointed to the desirabil-
of importing meat, dried milk and eggs instead of importing or
ducing animal feeding stuffs. The value of drying food prod-
s and its effect on national dietetics deserves special mention in
connection; thus, for example, the ministry of food was
e in 1942 to arrange for the importation of 80,000 tons of dried
powder in place of its equivalent 2,100,000 tons of poultry
ding stuffs. Improved methods of packing—boning of meat
and telescoping of carcasses—resulted in considerable saving in shipping space. Other important developments were to be expected, *e.g.*, the importation of dehydrated butter.

Before World War II Great Britain imported about 11,000,000 tons of food for man and 9,000,000 tons for animals; the total consumption of food by the human population was approximately 27,500,000 tons. According to official statements British farmers had produced 63% of the food required for 1942–43 and private gardeners and allotment holders had increased their production of vegetables by 1,000,000 tons and of potatoes by 500,000 tons. From the efforts which farmers had had to make towards becoming self-supporting in regard to animal feeding stuffs it would appear that imports of these had been reduced to the offal from wheat and the presscake from oil seeds. If this were so and if the total weight of food consumed was unchanged from prewar days then, on a rough estimate, the total import of human food and animal feeding stuffs must have been reduced to little more than half the prewar level.

To make the best use of the food supplies made available according to this carefully planned policy, distribution was controlled by rationing, collective civilian feeding in factory and office canteens, schools and municipal "British" restaurants were organized and widespread publicity through press, radio and cinema drew attention to the importance of various methods of processing, including cooking, in conserving food values; perhaps the best known example is in relation to vitamin C, which is so easily lost or destroyed in the cooking of vegetables; as much as 400 tons of ascorbic acid per annum are lost or destroyed in Great Britain in the course of cooking.

The British dietary was thus very much simpler than before World War II; much less meat was available; shell eggs were scarce and imported fresh fruits rarely seen. Milk was much more evenly distributed throughout the population. The results of these changes are seen in the contribution of various foodstuffs to the dietary as set out in the table. (B. S. Pt.)

Disasters.

During 1942 loss of life and property in accidents included the following:

Aviation

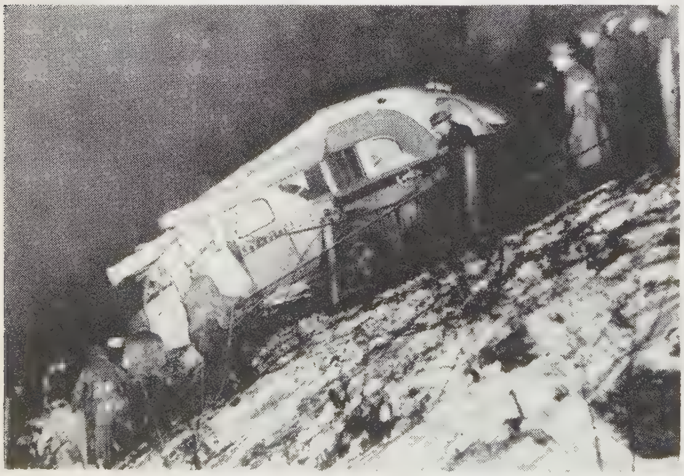
(The aviation disasters listed below include only those in which 10 or more lives were lost.)

Jan. 16	Las Vegas, Nev. Fifteen army ferry pilots, Carole Lombard, movie actress, her mother, two other passengers and crew of three were killed in crash of transport plane on Table Rock mountain.
March 14	China. Maj. Gen. Lancelot Dennys, head of British air mission to China, and 12 others were killed in crash of transport plane flying from Kunming to Chungking.
March 16	Pendleton, Ore. U.S. Army bomber crashed on peak 20 mi. from Pendleton, killing 10 airmen.
May 1	Near Salt Lake City, Utah. Seventeen persons died when passenger plane crashed into Ensign Peak.

June 4	Near San Francisco, Calif. Nine soldiers and 5 civilians were killed when army bomber crashed at Hamilton field in attempted emergency landing.
June 5	Pensacola, Fla. Navy patrol plane with 10 men aboard was lost in Gulf of Mexico.
July 1	Near Welch, W.Va. Twenty-one officers and enlisted men were killed in crash of army transport plane.
July 30	Minneapolis, Minn. Ten persons aboard army ferry command plane were killed when plane crashed in take-off from Wold-Chamberlain airport.
Aug. 15	Near Peru, Mass. Sixteen of 18 men were burned to death when big army transport plane crashed on Peru mountain in Berkshire hills.
Aug. 23	Near Dahlgren, Va. Ten and possibly 11 men were killed when navy flying boat crashed in field.
Aug. 25	London, England. Duke of Kent and all passengers and crew (number not announced) were killed when British flying boat crashed in Scotland.
Aug. 25	Washington, D.C. Navy announced that 14 officers and men were missing on flight aboard navy plane from Alaska to Seattle, Wash.
Sept. 10	Tucson, Ariz. Entire crew of 10 men and officers were killed when army plane flew into mountain slope in eastern Arizona.
Sept. 11	Buffalo, N.Y. Twelve workers were killed and 35 were injured when a flaming plane, whose pilot had bailed out, dived nose first through Curtiss-Wright aeroplane factory in East Buffalo.
Sept. 27	Near Algiers, Algeria. French civilian plane crashed; all 25 occupants were burned to death.
Sept. 28	Near São Paulo, Brazil. Crash of Brazilian plane killed all 15 aboard.
Oct. 1	Near Coamo, P.R. Twenty-two were killed in crash of army transport plane on mountain.
Oct. 3	Off Botwood, N.F. Eleven persons were killed and nine others injured when plane carrying 37 persons fell into Atlantic ocean.
Oct. 17	Des Moines, N.M. Eleven were killed when bomber crashed atop Sierra Grande Peak.
Oct. 23	Palm Springs, Calif. Nine passengers and three crew members of big airliner died when plane crashed and burned on slope of Mt. San Jacinto.
Oct. 26	Montreal, Canada. Ferry command plane crashed in flames on Montreal island, killing all 16 occupants.
Dec. 2	Soda Springs, Ida. Four-motored army bomber crashed in mountain canyon, killing all 10 occupants aboard.
Dec. 15	Near Fairfield, Utah. Seventeen of 19 persons aboard airliner were killed when plane crashed in desert.
Dec. 30	Near Musselshell, Mont. Twelve army fliers were killed when flying fortress crashed.

Fires and Explosions

Jan. 1	Burslem, Staffordshire, England. Fifty-eight miners died in colliery blast.
Jan. 28	Mount Harris, Colo. Thirty-four miners died in explosion in coal mine.
Feb. 10	New York city. Transport ship "Lafayette" (former liner "Normandie"), toppled over at Hudson river pier after 12-hour fire in superstructure. One was killed and 128 injured in fire caused by spark from worker's acetylene torch.
March 4	Burlington, Ia. Fifteen munitions workers were killed, 51 others were injured and 5 were missing in blast in ordnance works.
March 26	Easton, Pa. Premature explosion of 21 tons of gelatinite in quarry killed 31 persons.
April 29	Tessenderloo, Belgium. Explosion in chemical plant killed 250 workers and injured more than 1,000 others, according to official D.N.B. (German) news agency dispatch received in Berne, Switz.
May 12	Osage, W.Va. Forty-five miners were killed by blast in coal mine.
June 5	Near Joliet, Ill. Explosion in Elwood ordnance plant killed 21 and injured 41; 33 were listed as missing.
Aug. 4	Cleveland, O. Fifty animals in Ringling circus were burned to death in fire that swept through the menagerie tent.
Nov. 28	Boston, Mass. Fire that started in night club when match w dropped on gauze-like draperies took lives of at least 493 perso and injured at least 172, many critically; high death toll was la to panic of patrons who rushed into lounge and piled up befo narrow revolving door.
Dec. 12	St. John's, N.F. At least 100 persons were burned to death wh fire swept through hostel where servicemen were attending ba dance.



TWENTY-TWO DEFENSE WORKERS were killed Dec. 22, 1942, when the bus in which they were riding was demolished by an avalanche near Aliquippa, Pa.

Marine

Jan. 24	Off Panama. U.S. submarine "S-26" was sunk in collision w naval vessel; 32 of crew of 35 were lost.
Feb. 22	Newport, Ky. Thirteen men and 3 women were feared drown when towboat sank after striking Ohio river bridge pier.
Feb. 24	Near Lawrence, N.F. U.S. navy dep't revealed that 1,193-t destroyer "Truxtun" and 6,085-ton naval transport "Pollux" we wrecked in gale at mouth of St. Lawrence river; 189 lives were lo
Sept. 21	Midland, Ont., Canada. Launch carrying party of picnickers sa in Georgian bay; 25 drowned.
Dec. 2	Cleveland, O. Tug and big oil-tanker barge both sank in Lake Er entire crews of both ships, totalling 34, were lost.
Dec. 2	Newport, R.I. Fifteen out of 17 sailors were drowned when sm 30-ft. boat capsized in gale.

Motor Traffic

(For statistics on U.S. traffic deaths in 1942, *see* ACCIDENTS.)

Feb. 26	Enid, Okla. Seven U.S. air corps servicemen were killed and others were injured when freight train crashed through bus.
July 8	Norristown, Pa. Eight persons were killed and 23 injured wh trolley and freight car crashed head on at Washington Squa Gardens.
Aug. 5	Crystal Springs, Miss. Thirteen persons were killed and 53 injur when a crowded bus and train collided at mid-town crossing.
Aug. 11	Titusville, Fla. Six soldiers were drowned when an army tru crashed through bridge guard and plunged into Indian river.
Oct. 28	Detroit, Mich. Sixteen were killed and more than 20 others we injured when a speeding passenger train ripped into motor jammed with school children and factory workers at grade crossi

Natural Disasters

Jan. 6	Rio de Janeiro, Brazil. Twenty-eight were killed and many oth injured in cloudburst over Rio de Janeiro.
March 15–16	Midwest and southern U.S. One hundred and thirty-six perso were believed killed in tornado that swept through Mississip Alabama, Tennessee, Kentucky, Indiana and Illinois.
April 27	Pryor, Okla. Tornado killed nearly 100 persons, injured betwe 150 and 300, and caused damage estimated at $1,000,000.
May 13	Western Ecuador. About 200 persons were killed and more th $2,500,000 in property damaged when severe earthquake roc provinces of Guayas, Manabi, Esmeraldas, Imbabura and Boliv
May 23	Eastern Pennsylvania. Floodwaters caused by torrential rains to toll of at least 30 lives and caused property damage estimated millions of dollars.
May 31	Northeastern Ohio. Huge wall of water swept along a 60-mi. stre of Lake Erie, drowning 7 persons and injuring at least 7 others.
June 12	Oklahoma City, Okla. Two tornadoes caused death of 29 perso and injuries to 25 others.
Oct. 16	Bombay, India. Cyclone rising from Bay of Bengal swept inla devastating vast area in two Bengal districts, and killing an e mated 40,000.
Oct. 16	Maryland, Virginia and West Virginia. Floodwaters of Poton river threatened to inundate Washington, D.C., as rain-swol streams caused 4 deaths and left 2,000 people homeless in th states.
Oct. 29	Berryville, Ark. At least 28 were killed and more than 200 oth were injured in tornado.
Dec. 19	Anatolia, Turkey. Four hundred and seventy-four persons w killed and 605 injured in severe earthquake.
Dec. 22	Aliquippa, Pa. Avalanche buried motorbus loaded with defe workers, killing 22.

Railroads

Jan. 16	Perla, Ark. Five persons, 4 of whom were soldiers, were killed 27 others were injured in head-on crash between switch engine passenger train.
March 7	Granby, Mo. Six were killed and 45 injured in head-on collis of two passenger trains near Granby depot.
April 11	Savage, Minn. Five were killed and 30 injured when passen train rammed local which had been stalled after hitting automo at crossing.
April 26	Jersey City, N.J. Train wreck in Hudson tube near Excha Place station caused death of 5 persons and injuries to 222 oth
June 14	Kittrell, N.C. Eight passengers were killed when freight tr rammed into observation car of flyer.
Sept. 24	Dickerson, Md. Passenger train telescoped into stalled night press and tossed rear pullman into path of freight; toll of known d was about 30.[1]
Dec. 27	Almonte, Ont., Canada. Thirty-five were killed and 118 oth injured when 3 rear cars of local train were telescoped by tr train.

(*See* also ACCIDENTS.)

per left: NEARLY 30 PERSONS were killed and 100 injured when a passenger in crashed into the rear of a preceding train Sept. 24, 1942, near Dickerson, l. The rear Pullman of the first train, shown here, was thrown into the path of freight train on the adjoining track

per right: WRECKAGE of the transport in which Carole Lombard, motion picre actress, and 21 others died Jan. 16, 1942, when the plane hit a mountain ar Las Vegas, Nev.

ove, left: ONE OF THE MOST DISASTROUS FIRES in U.S. history took the es of about 500 men and women trapped in a blazing Boston night club Nov. , 1942

ove, right: AN EARTHQUAKE which shook Guayaquil, Ecuador, and several er towns took a toll of about 200 lives May 13, 1942

Disciples of Christ. Statistics as of June 30, 1942, showed a total membership of 1,664,943 in the United States and Canada (Canada 9,363). This was a net loss of 107,023 for the year. The reported loss might indicate a closer scrutiny of church rolls, for the number of additions was about normal—50,046 by baptism and 43,402 otherwise. There were 8,002 churches in the United States and Canada (a loss of ten), and 7,693 ministers (a gain of 113). Chaplains in service numbered 203. The Disciples had churches in 39 other countries, most of which were not mission fields. In Great Britain there were 172 churches with 13,445 members; in Australia, 338 churches with 31,060 members; in New Zealand, 57 churches with 4,531 members. There was no report from Poland, which was listed as having 65 churches and (estimated) 40,000 members. The world membership in 1942 was 1,826,434, or 8,128 less than one year earlier. Expenditures for local church maintenance in the United States and Canada were $13,480,374 (a gain of $1,640,809), and for missions and benevolences $2,023,614 (gain $66,196). The debt which burdened the United Christian Missionary society for 20 years, and which amounted to $589,794 on July 1, 1941, was liquidated. The Emergency Million not only extinguished this debt but provided funds for special wartime activities in the interest of servicemen and religious and social work in the vicinity of camps and in the new communities of industrial workers near the great new war plants. The foreign missionary agency was able to continue in contact with and support its work in all fields except Japan and the Philippines.

The missionary magazine, *World Call,* had a monthly circulation of 39,550, a gain of 3,953.

The international convention of the Disciples of Christ for 1942 met at Grand Rapids, Mich., July 28–Aug. 2. The next was scheduled for May 1944.

(W. E. GA.)

District of Columbia: *see* WASHINGTON, D.C.

Ditmars, Raymond Lee (1876–1942), U.S. naturalist, was born June 20 at Newark, N.J. He was graduated from Barnard Military academy in 1891 and was then employed as assistant curator at the American Museum of Natural History. He left in 1898 to become a reporter for the *New York Times,* but he never lost interest in his chief hobby: collecting snakes. His collection, started when he was a boy and sheltered in the top floor of his home, became so famous that naturalists in the tropic jungles sent him rare—and dangerous—specimens. In 1899, he joined the newly organized New York Zoological park (Bronx zoo) as curator of reptiles and presented his entire collection to the zoo. Dr. Ditmars, who wrote entertainingly about insects, snakes and reptiles, frequently explored the tropics in search of new specimens. In 1941, he trapped several giant spectral vampires in Trinidad and on his return organized an insect museum stocked with ghost bugs, robber flies, ant lions, umbrella ants and other rare species. He did research on tuberculosis among monkeys and on treatment of human ailments with snake venom. He was curator in chief of the department of reptiles and mammals at the Bronx zoo, 1910–42. He was the author of *The Reptile Book* (1907), *Reptiles of the World* (1909), *Snakes of the World* (1931), *Strange Animals I Have Known* (1931), *Thrills of a Naturalist's Quest* (1932), *Forest of Adventure* (1933), *Confessions of a Scientist* (1934), *The Book of Zoography* (1934), *The Book of Prehistoric Animals* (1935), *The Book of Living Reptiles* (1936), *The Making of a Scientist* (1937) and *The Book of Insect Oddities* (1938). He died in New York city, May 12.

Divorce: *see* MARRIAGE AND DIVORCE.

Dodge, Raymond (1871–1942), U.S. psychologist, was bor February 20 in Woburn, Mass. He graduated from Williams college in 1893 and went to Germany, wher he took his doctorate at the University of Halle. While in Germany, Dr. Dodge studied the human eye in the action of readin and subsequently discovered that the eye, far from glidin smoothly along a line of printed matter, proceeded in jerky movements. His findings in this field were an important contributio in the teaching of reading in schools. He was professor of psychology at Wesleyan, 1898–1924, and at the Institute of Psychology, Yale university, 1924–29, and was one of the three origina founders of the Institute of Human Relations, also at Yale, wher he perfected his theories on visual perception. During Worl War I he was consulting psychologist in the chemical warfare service and in the navy bureau of navigation; in the latter post, h helped select potential candidates for gunners and devised a gun pointing recorder which simplified selection of competent gunners Dr. Dodge died in Tryon, N.C., April 8.

Dog Racing. Dog racing met with varying successes durin 1942. Boston experienced one of its best seasons in history, both in attendance and pari-mutuel handle, whil Florida had one of its poorest because of gasoline curtailment an dimmed lights due to wartime precautions. A dozen tracks operated during 1942, ranging from Phoenix, Ariz., on the west t Boston on the north and Miami on the south. Never Roll prove

NEVER ROLL (no. 5) was the outstanding greyhound racing dog of 1942. the summer races in Boston he set four world's records, tied another, and w 17 out of 24 starts be the outstanding greyhound of the year, setting four world ords; tying another; winning 17 out of 24 races, and ending season with a "79" rating. (M. P. W.)

minican Republic,

a republic occupying the eastern two-thirds of the West Indian island Hispaniola. Area: 19,326 sq.mi.; pop. (1939 est.) 1,656,219. least three-fourths of the population, largely concentrated in areas—around Ciudad Trujillo in the south, and in the Cibao lands in the north—is of mixed blood. Capital city: Ciudad ijillo (108,070). Second city in size is Santiago de los Cabal- os (34,000); Puerto Plata (12,000) is the largest city in the th. Language: Spanish. President (elected May 1942): Gen. ael Leónidas Trujillo.

History.—The political event drawing greatest attention during year was the national election in May. Former president and ong man" of the republic, Gen. Rafael Leónidas Trujillo, was pposed for the office of chief executive, and was elected for a -year term. This was the first national election in which nen were allowed to vote; one woman senator was elected, and e others became representatives. Because of the world situa- , Gen. Trujillo assumed office immediately.

he Dominican government took action early in 1942 to pre- t subversive action within its boundaries, the strategic location Hispaniola making it unusually important in hemisphere de- se. Property owned by alien enemies was taken over, and axis onals were forbidden to acquire motor vehicles. All boats in onal waters were placed under government jurisdiction, and ular inspections of the coast were ordered to prevent the ene- from establishing secret bases on Dominican territory for sup- of submarines. The need for control of the movement of ted States currency was given emphasis when a Spanish ship- ter was reportedly seized with $220,000 in "hot" money in his session. The necessary legislation to prevent the export and ort of such currency was enacted in July.

he Dominican economy was seriously affected by the disrup- of shipping facilities caused by World War II. All stocks of omobiles, both new and used, were taken over by the govern- nt, also all rubber stocks, and both gasoline rationing and traf- control were undertaken. Shortages in food supplies resulted in formation of national commissions to set price ceilings, en- rage rice production, and to regulate trade. The export of stock, meat, eggs and some other foodstuffs was prohibited y in May.

ducation.—Official statistics (1940) listed a total of 951 ools; enrolment 116,574. The education budget for the year 1,377,000 pesos.

inance.—The monetary unit is the peso, equal in value to the . dollar. The budget for 1942 estimated revenue as $12,839,- ; expenditures as $12,820,000.

rade.—Figures for the first half of 1941 (trade with the U.S.) showed exports of $5,024,000 and imports of $3,627,000 11%).

ommunication.—The republic is connected with the outside ld by sea and air, with the former curtailed by the war. Air ice increased in 1942; a new contract was granted during the r to British West Indian Airways. In 1940 there were 268 km. ublic railroads, and 3,000 mi. of highway, less than one-third which was improved motor road.

Donations and Bequests.

More than $734,643,000 was reported as having been contributed for U.S. philanthropic purposes during the year 1940 by persons filing income tax returns for that calendar year, the latest for which such information was available in 1942. This was an increase of $239,853,000 over the $494,790,000 reported in income tax returns for 1939. Sixty-seven per cent of the contributions reported for 1940, or $493,486,000, came from persons reporting incomes of $5,000 or less. Charitable bequests for 1939, the latest year for which information was available in 1942, were $143,365,000.

Six of the larger U.S. foundations and three community trusts dispensed funds of $18,155,000 in 1941, bringing the total of disbursements by them since 1920 to $722,404,000.

Gifts to 52 educational institutions of higher learning for the fiscal year 1941–42 amounted to $22,207,844 and bequests to these same institutions were $8,821,738, making a grand total of $31,029,582. These same institutions for the fiscal year 1940–41 received a total of $37,980,514 in gifts and bequests.

A continuing study by the John Price Jones corporation of publicly announced gifts and bequests in seven large cities (New York, Chicago, Washington, Philadelphia, Baltimore, St. Louis and Boston) presented an up-to-date trend of U.S. philanthropy for 1942. While these figures were far from complete, as they included only these cities, they nevertheless indicated in what direction the U.S. philanthropic dollar was going.

The total of gifts in these cities for 1942 was $78,269,358, of which $33,820,208 went to U.S. war organizations, such as the Red Cross and U.S.O.; $11,138,320 to community chests, many of which included in their quotas funds for war emergency work; and $5,633,269 for foreign relief. All other types of philanthropy suffered losses in these cities for 1942. Bequests in the seven cities amounted to $47,619,917 in 1942, with $25,779,522 being bequeathed to educational institutions. An outstanding bequest of the year was that of Walter P. Murphy—approximately $20,000,000 for the technological institute he had established by a prior gift at Northwestern university, Evanston, Ill.

New York led the seven cities with gifts of $34,340,138 and bequests of $17,330,269.

Doolittle, James

(1896–), U.S. army air officer, was born Dec. 14 at Alameda, Calif. He joined the army as a flying cadet during World War I and became an officer, but the army refused to let him go overseas, declaring he was too valuable as an instructor. After the war, he studied engineering, graduating from Massachusetts Institute of Technology in 1925 with a doctor of science degree. An expert pilot, he toured European and South American capitals, thrilling crowds with stunt flights. In 1930, he won the Harmon trophy for his experimental flights; in 1931, he won the Bendix trophy race from Burbank to Cleveland; in 1933, he won the Thompson trophy. He then retired from racing to join the army board studying reorganization of the air corps. In July 1940, he was ordered back to active duty as a major in the air corps reserve and in Jan. 1942, he was promoted to lieutenant colonel in the air corps. On April 18, 1942, Doolittle electrified the world by leading a U.S. bomber squadron in a spectacular daylight raid over Tokyo. For this exploit, he was awarded the congressional medal of honour by President Roosevelt and was promoted to the rank of a brigadier general. He then was in command of the

12th U.S. air force with General Eisenhower's armies during the North African campaign and was named for promotion to the rank of a major general, Nov. 21, 1942.

Drew, George Alexander (1894–), Canadian soldier and politician, leader of the Conservative party in Ontario and official leader of the Conservative opposition in the legislature at Toronto. He was born at Guelph, Ont., May 7, and received his education at the Collegiate Institute of Guelph, Upper Canada college and the University of Toronto. His military career began with his joining the 16th battery of Canadian artillery at Guelph in 1910. He enlisted in the C.E.F. in 1914, went overseas in 1915 and distinguished himself on active service. Wounded in 1916, he was invalided home to Canada in 1917, but not finally discharged until June 1919. Admitted to the bar in 1920, he practised in Guelph until 1925 and then in Toronto. Entering the provincial legislature, he became leader of the Conservative opposition. Among his writings are *Canada's Fighting Airmen, The Truth about the War,* etc. Col. Drew attracted wide attention by his denunciation in 1942 of the government's action in regard to the Canadian expedition to Hongkong. Proceedings were initiated against him but were later dropped.

Drought. Long periods of moisture deficiency such as occurred in the interior of North America in the 1930s had a far-reaching influence on the agricultural economy of the affected region, leading in many cases to important social readjustments. Such drought conditions generally were characteristic of the outer portions of the humid climates where near-by arid conditions sometimes were transported by shifts in the prevailing atmospheric circulation pattern. The year 1942 was characterized by drought conditions in several areas of normally humid climates where the drought risk is relatively small.

The 1941 fall drought in portions of the normally humid southeastern United States continued through the winter and spring of 1942. The situation was most serious in Georgia. Except for the month of November, the period from Aug. 1941 to June 1942 was uniformly deficient in rainfall. The amount was the least on record for the state. The Carolinas and northern Alabama also were affected. The situation in Georgia reached a crucial stage during a hot, dry period in late May and early June when in 11 days there was a 61% reduction in the available hydroelectric power in Lake Burton, largest water-power system in the state. All growing crops were badly affected and the poor condition of the pastures necessitated considerable stall feeding of livestock at a time when pasturage should be the most ample. Finally, adequate rains in June ended the drought.

In Argentina, serious winter drought conditions were experienced in July and August, spreading over much of the cereal-producing area. Cold weather and severe frosts combined with dryness in checking the winter seedings. Relief came in September.

South Africa had a continuation of the 1941 drought through the growing season into 1942. The corn crop was reduced to the extent that there was none available for export. Forage crops were also affected, producing a shortage of meats and dairy products. Heavy drains on the food supply by war refugees, prisoners and ship movements combined with the drought conditions to produce shortages.

Most continents received adequate rains in agricultural areas during 1942. In Asia, dryness caused a one-third reduction of the rice crop in Korea and a midsummer drought reached serio proportions in the upper Yangtse valley. India had ample rai except in the early part of the year in wheat-growing region Turkey and Iran had a short, early summer drought.

In Australia, the great drought of 1940–41 was ended, a 1942 was a very favourable year for agriculture.

In Africa, other than South Africa, minor droughts occurre in French North Africa and in Uganda. In the latter distri the cotton crop was hindered by dryness during most of t planting season (May to August). (*See* also Agriculture; Irr gation; Soil Erosion and Soil Conservation.) (H. R. B.)

Drugs and Drug Traffic. Immediately upon the e trance of the United Stat into war, the Food and Drug administration placed at the servi of the war agencies its staff of experts trained to examine and conduct laboratory investigations of drugs. Wartime dislocatio imposed increased responsibilities in maintaining the purity a quality of drugs, whether they were used by the armed forces by civilians.

Seizures of violative drugs and prosecutions of responsib shippers increased in the fiscal year 1942; violative device sei ures declined. Fewer dangerous drugs and fewer products bea ing inadequate directions and warnings were encountered by t inspectors, who found also that comparatively few druggists a selling without prescriptions drugs dangerous for use in se medication. The number of medicines removed from the mark because of false and misleading therapeutic claims remained abo the same as in the previous year; permanent injunctions we issued to prohibit the shipment of such misbranded medicines a number of cases in which seizures had not resulted in corre tion. Deviation from standard strength and purity was respon ble for a slightly higher percentage of the seizures than in 1941.

Seven hundred and eight (708) new-drug applications were pe mitted to become effective. The first seizure and the first pros cution case under the new-drug provisions were instituted in 194 The seizure libel charged that the article was a new drug f which no application was effective. The prosecution case involv the falsification of an application.

An amendment to the Food, Drug and Cosmetic act giving t Food and Drug administration complete control over insulin a insulin-containing drugs was enacted in December 1941, just b fore the expiration of patents previously providing such cont by the Insulin Committee of the University of Toronto.

(W. G. Ca.)

League of Nations.—During the third war year, Sept. 19 to Aug. 1942, the activity of the three international control orga —The Opium Advisory committee (O.A.C.), the Permanent Ce tral Opium board (P.C.O.B.), and the Drug Supervisory bo (D.S.B.)—was maintained in its essential parts.

The international drug supervision is based on informati supplied by governments under existing treaties and on the ports issued by the three international control bodies. During t period under review, the exchange of information stipulated in t Conventions continued. Although impaired by gaps, by the i perfection of data, and by the delay and dislocation caused war, the essential measures of control continued uninterrupted National administrations collaborated closely with the int national organs.

Governments transmitted their annual reports on the traffic opium and other dangerous drugs, reports on seizures in the illi traffic and texts of laws and regulations.

On Dec. 1, 1941, the D.S.B. transmitted to governments "Statement of Estimated World Requirements of Dangerc Drugs in 1942" (Document C.61.M.58.1941.XI). This ann atement, which contains drug estimates for 177 states and territories, indicates the legitimate limits of the manufacture of and e trade in drugs. The limits of the world manufacture and ade for 1942 with regard to the five principal drugs were estiated at 49.7 tons for morphine, 32.8 tons for codeine, 4.7 tons r cocaine, 3.1 tons for dionine and 0.8 ton for diacetylmorphine.

The 1931 convention placed upon the D.S.B. the duty of esblishing estimates itself for those countries and territories which l to furnish them. Accordingly, the D.S.B. framed estimates r 1942 in respect of 17 countries and 33 territories, including untries where political and administrative conditions have anged on account of war.

For 1942, governments themselves submitted estimates in reect of 54 countries and 73 territories, a total of 127, which repented 72% of all the countries and territories of the world. is was the first time after the coming into force of the 1931 nvention that estimates were furnished by all sovereign couns in the western hemisphere.

Although, due to the cessation or stricter control of interional communications, the international illicit traffic dimined, the latent danger from traffic and drug addiction might inase as war spreads in the far east and in Europe. There were ny indications that in all parts of China under Japanese miliy occupation and in other territories occupied by Japan after c. 1941 conditions were getting steadily worse.

tch Borneo: *see* Dutch East Indies; Netherlands lonial Empire.

tch Colonial Empire: *see* Dutch East Indies; Netherds Colonial Empire.

tch East Indies. The largest Netherlands colonial possession, under Japanese military occuion in 1942. The Dutch East Indies is a huge archipelago, with eral very large islands, Java, Sumatra, Celebes, Borneo and w Guinea (part of Borneo is British and part of New Guinea is ler Australian administration), and many smaller ones. The hipelago is located near the equator, from 6° N. to 10° S. tude. It is south of the Philippines, southeast, east and west the Malay peninsula and north of Australia. Area, 733,681 mi.; pop. (census of 1930), 60,731,025; estimate (end of 0), 70,476,000, of whom 48,416,000 live in densely settled a and the adjacent small island of Madura, while 22,060,000 in the so-called Outer Islands, the less settled and developed ions of the archipelago. Capital, Batavia (437,000). Other ge cities: Surabaya (313,000); Bandung (167,000). The at majority of the natives are of the Moslem faith, although admixture of Hindu and pagan practices is found in some rens. There are about 2,500,000 Christians, about 1,000,000 ddhists and a number of Animists. Governor general (apnted in 1936), until the Japanese occupation: Jonkheer A. L. Tjarda van Starkenborgh-Stachouwer.

istory.—The year 1942 witnessed a temporary eclipse of Dutch e in the East Indies after three centuries of colonial empire. Jan. 11, 1942, there were Japanese landings at Tarakan, cen of a rich oil district in Borneo, and at three places in Celebes. fierce naval battle took place in the Straits of Macassar from 1. 22 until Jan. 26; the Japanese forced their way southward spite of losses. By early February Japanese air raids on the ncipal naval base at Surabaya and on other towns in Java became increasingly frequent. The overrunning of Malaya paved the way for the invasion of Sumatra, where Palembang fell on Feb. 16. The Japanese invaded Bali and landed on Timor Island on Feb. 20. After the battle of the Java sea, on Feb. 27–28, the Japanese, in the climactic phase of the operation, landed at various points in Java during the first week of March and gained complete mastery of the air. Batavia, Buitenzorg and other towns fell. By March 9 Bandung, the inland mountain town, had surrendered and the Japanese claimed the capture of 93,000 Dutch and colonial and 5,000 British troops. This marked the end of organized resistance. Some guerrilla warfare continued in Borneo, Sumatra and Celebes; but there was little evidence to show that it was widespread or successful.

OIL TANKS AND CARS were fired by the Dutch as they evacuated petroleum centres in Java during the Japanese invasion of March 1942. This picture, taken by a Jap photographer, reached the United States by way of Brazil

News about the East Indies under Japanese occupation was necessarily meagre in 1942 and was largely based on Japanese broadcasts. There was apparently some effort to arouse pan-Asian sentiment by changing Dutch to native names. Instructions were given to respect the "adat," or native code of customs and living habits. The Japanese claimed progress in restoring oil production and port installations which had been damaged during the fighting and asserted that cargoes of rubber from the Indies were reaching Japan. A curtailment of sugar production to 500,000 tons annually was announced on the Tokyo radio in the summer of 1942; this may have been designed to divert production to crops more useful for war purposes.

Education.—As of 1939, there were 21,440 schools of all types, with 2,324,505 pupils. Government expenditure on education was 31,267,100 guilders; 7.2% of the population was literate in 1930.

Defense.—The armed forces at the disposition of the Dutch military authorities at the time of the Japanese invasion were in the neighbourhood of 125,000–150,000 men, consisting mainly of trained natives, with a stiffening of Dutch officers and technical units. The East Indies navy was reliably estimated at 3 cruisers, 8 destroyers, 18 submarines and 42 torpedo boats. There had been increased attention to defense with the growth of tension in the far east, and the air force was supposed to number between 500 and 1,000 planes. The military establishments of the Netherlands East Indies were mostly wiped out by the invasion; remnants of these forces escaped to Australia and continued the struggle along with the United Nations. Government expenditures on defense were 517,000,000 guilders in 1941.

Finance.—The Dutch guilder (florin) (53.1 cents U.S. in 1941) is the unit of currency. Budget revenues were 694,140,035 guilders in 1941. Expenditures were 829,304,901 guilders in 1941. Amount of currency in circulation in 1941, 215,885,000 guilders. The public debt of the colony, consolidated and floating, was 1,372,600,000 guilders in 1939. The Java bank, the central banking institution, controlled the note issue. The Japanese did not introduce the yen as the currency during 1942, but carried on with what was apparently an intermediate currency organization, utilizing the notes of the Bank of Java and special currency issued for the use of the occupying forces.

Trade and Communication.—Imports in 1940 were 444,300,000 guilders and exports were 873,500,000 guilders. No complete figures were compiled for 1941. The principal exports in 1940 were rubber (328,254,000 guilders), oil and petroleum products (169,557,000 guilders), tin and ore (72,218,000 guilders), sugar (52,041,000 guilders), tea (50,925,000 guilders).

There were, in 1940, 43,450 mi. of highways and 4,620 mi. of railways, 3,387 in Java and 1,233 in Sumatra. The railways in 1940 carried 72,000,000 passengers and 11,000,000 tons of freight. There were 94,000 motor vehicles of all kinds in 1941. About 10,870 steamers, with a total tonnage of 12,456,664, cleared from the ports of the colony in 1939. The Royal Netherlands Airways was formerly one of the main routes of communication between Europe and the orient.

Agriculture.—Figures of output for the principal agricultural products in 1939 were as follows: sugar, 1,576,000 tons; copra, 537,000 tons; rubber, 383,000 tons; palm oil, 244,000 tons; coffee, 121,000 tons; tea, 83,000 tons; pepper, 71,000 tons; quinine, 12,000 tons.

Manufacturing.—Although the colony has always been primarily a source of raw materials, the world crisis of 1929–33 and the abrupt fall in the prices of primary products, together with the inundation of the country with cheap Japanese manufactures, gave an impetus to the development of local industries, such as batik, spinning and weaving, tobacco, ceramics, paint, soap, chemicals, cement, wood, glass and paper.

Mineral Production.—While Java is the principal source of cultivated crops, the Outer Islands supply most of the mineral resources of the colony. Figures of output for the principal mining products in 1939 were as follows: oil, 7,949,000 tons; tin, 31,000 tons; coal, 1,781,000 tons; gold, 2,500 tons; silver, 19,200 tons. Dyestuffs.

Conservation of raw and finished materials was the industrial keynote for 1942. The national emergency brought about many drastic and sudden changes, and the organic chemicals industry was no exception. The most important problem confronting the dyestuff manufacturer was to furnish sufficient quantities of the highest quality vat colours for the requirements of the armed forces. The conversion of the industry from peacetime economy to fulfil wartime needs was a major task. Many of the basic materials used for the production of dyes are also required in the manufacture of explosives, aviation gasoline, pharmaceuticals, refrigerants, synthetic rubber, etc. and the dyestuff industry had to share these essential chemicals with other vital uses.

The government consumption of certain vat colours, used for olive drab and khaki shades, increased abnormally long before the war began. Concurrently, a growing demand for civilian goods dyed or printed with fast colours manifested itself. To meet this situation the dyestuff industry stepped up production on the vit war colours by expanding facilities. With the military progra developing rapidly it became evident that the production of thes particular anthraquinone vat colours would be insufficient to fi all the requirements of the government. This brought about th War Production Board Conservation Order M-103 which becam effective April 1, 1942. It restricted the sale and use of nin anthraquinone vat dyes for specified military purposes only an assured mills holding government contracts of a sufficient suppl of vat colours for their requirements. Quarterly civilian quota on the anthraquinone vat dyes not restricted for military us were also established. The Office of Price Administration adv cated the production of good quality, fast dyes as being essenti to the wartime conservation program; fewer nonessential cloth were decreed; restrictions placed upon style and fabric chang of civilian textiles; work clothing sales increased and the suppl of dyes adequately met the demand with but few exception Consequently war textiles, manufactured under many difficultie still possessed the desirable characteristics of materials prev ously obtainable.

The increased activity in the production and sales of synthet organic chemicals in 1941 was due to an increase in both civili and military consumption. Military demands were confined relatively few individual items. Not many synthetic organ chemicals were under general preference orders, limitation orde or price control.

The major increases in the production of dyes in 1941 as compared with 1940 were indigo 83% and azoic dyes 69%. Litt change occurred in the relative importance by class of applicatio of the various groups; vat, direct, sulphur and acid dyes a counted for about 80% of the total. Production of coal-tar dy in 1941 was 168,595,000 lb., an increase of 31.9% over the pr ceding year. Sales were 176,791,000 lb., 44.1% higher than 1940 and valued at $113,308,000. Vat colour production, excl sive of indigo, was 26,616,000 lb. and 40.5% over the 1940 tota 1942 production was comparable with 1941 but official figur were not available by the close of the year. (A. G. BN.)

Eaker, Ira C.

(1896–), U.S. army air officer, was bo April 13 in Field Creek, Tex. He studied the University of the Philippines, Columbia and Southern Ca fornia universities and was commissioned as second lieutenant the infantry reserve in 1917. Transferred to the Philippines 1919, he served in the air corps and later was given comman of the Manila air depot. In 1929, he was co-pilot in an arm plane which established an endurance flight record of 150 hou and 40 minutes, and some years later he made a cross-contine "blind flight." He served as executive officer in the air cor headquarters in Washington, 1937–40, and by Jan. 1942, he ha become a brigadier general. In the summer of 1942, he w named chief of the U.S. bomber command in the Europe theatre of war and in August of that year, he led a Flyi Fortress squadron that raided Rouen in the first all-America aerial attack on nazi-held territory. With Lt. Gen. Henry Arnold, he wrote *This Flying Game* (1936), *Winged Warfa* (1941) and *Army Flyer* (1942). After Maj. Gen. Carl Spaa went to North Africa in Dec. 1942, to reorganize Allied air pow there, it was understood that Gen. Eaker would succeed hi temporarily as U.S. air commander in Europe.

Ear, Nose and Throat, Diseases of.

During the ye 1942 sulphon mide drugs were applied locally in the ear, first cleansing t external canal thoroughly, drying it and blowing the powder Sulphanilamide or sulphathiazole powder was introduced in e nasal chambers by means of a powder blower. In the in- mmatory conditions of the pharynx, this structure was gently ufflated with one of the sulphonamides, coating the surfaces ificiently. The patient was instructed not to cough or spit for out one half hour after this treatment. Following mastoid erations, the powder was dusted in the cavity, with splendid ults.

A few cases of radical frontal, ethmoid and maxillary sinus erations were reported in which near the conclusion of the eration, one of the sulphonamides was dusted into the cavities. all of these, healing was far better than under similar opera- e procedures without the local use of the sulphonamides.

Dr. Harry P. Schenck and others reported favourable results the administration of a finer preparation of the sulphonamides, nely the microcrystals of sulphanilamide and sulphathiazole h and without suspension in a mild isotonic vasoconstrictor. e purpose of the finer preparation, that is the microcrystals, s to have the drug so finely divided that it would be in direct tact over a larger area of infected tissue surface, with no eterious local action; that it would have long contact with the per stability, as far as the chemical reaction was concerned, npatible with the upper respiratory mucous membrane in ry possible manner. Thus microcrystals of sulphanilamide or phathiazole in suitable vasoconstrictor solution could be ayed, instilled or packed wherever the rhinologist wished to ce this medicament.

stman, Joseph B. (1882–), U.S. government official, was born June 26 in Katonah, Y. He was graduated from Amherst college in 1904 and studied at Boston university. He was appointed to the Interstate mmerce commission by President Wilson in 1919 and was ppointed by succeeding presidents until 1933, when he served President Roosevelt's federal co-ordinator of transportation. ring his 14-year tenure on the ICC, Eastman was considered government-ownership" man by many railroad presidents be- use he fought to lower freight rates and executive salaries. He ounced the unnecessary duplication of services and sought to law dummy corporations and holding companies. In 1936, he urned to the ICC and in Dec. 1941, Mr. Eastman, then chair- n, was appointed by President Roosevelt as director of the vly-established Office of Defense Transportation (ODT), de- ned to co-ordinate federal and private transportation policies. May 1942, when the rubber shortage became acute, he was en authority to curb travel of motor cars, trucks and buses. September he ordered curtailment of all travel to football nes and on Oct. 1, he froze railway passenger schedules, elimi- ing special trains for sports events. (*See* also DEFENSE TRANS- RTATION, OFFICE OF.)

ton, Edward Dwight (1851–1942), U.S. educator, was born Jan. 12 in Lancaster, Wis. was graduated from Beloit college in 1872 and received D.D. grees from Northwestern and Yale universities. He was ordained minister of the Congregational church in 1876, and served in pastorates at Newton, Ia., and Oak Park, Ill. He was president of Beloit college, 1886–1905, 1907–17 and president emeritus from 1917 to 1942. He died in Fairfield, Conn., June 18.

Eberle, Abastenia St. Leger (1878–1942), U.S. sculptress, was born April 6 in Webster City, Ia. In her lower east side studio in New York city, Miss Eberle welcomed neighbourhood children into an improvised playroom, set up in her own quarters so that she might better study her subjects. She is represented at the Metropolitan museum, New York city, the Chicago Art institute, the Worcester Art museum, the Peabody museum in Baltimore, the Carnegie institute at Pittsburgh and the Detroit museum. She received the St. Louis exposition bronze medal, 1904, and the Lindsay Morris Sterling award of the Allied Artists of America, 1931. Miss Eberle died in New York city, Feb. 26.

Eberstadt, Ferdinand (1890–), U.S. government official, banker and lawyer, was born June 19 in New York city. He graduated from Princeton, 1913, and took his law degree from Columbia university, 1917. A corporation lawyer, Eberstadt was associated with a Wall street investment house until 1931, when he opened an investment-banking firm. When Chairman Donald Nelson organized the War Production board in Jan. 1942, he named Eberstadt to one of the vice-chairmanships, and placed him in charge of synchronizing the army and navy needs with production schedules. Within six weeks Eberstadt devised a controlled materials plan to get scarce materials in sufficient quantities to war factories on schedule. In a speech in New York city Dec. 2, 1942, he declared that the United States might supply munitions and supplies to French forces fighting with the allies, and also pleaded for a tolerant understanding of the confusion that accompanied the almost overnight creation of a $100,000,000,000 war industry.

Economic Defense Board: *see* ECONOMIC WARFARE, BOARD OF.

Economics. No outstanding contribution was made in either pure or applied economics during 1942. Although it takes some time for judgment to ripen concerning the merits of the findings of research, the Conference in Research in Fiscal Policy established by the National Bureau of Economic Research made a substantial contribution in "Fiscal Planning for Total War." The Brookings institution devoted its attention, at a time when price control and inflation were topics of current interest, to the theories of "Price-Making in a Democracy." The Twentieth Century fund sponsored popular studies in post-war economic problems. The Harvard Committee on Research in the Social Sciences issued a study entitled "Parity, Parity, Parity," which emphasized the expansion of the parity concept from land economics to labour and capital. The Oxford Institute of Statistics issued several timely studies on vital war problems. The Graduate Institute of International Studies at Geneva contributed a special study on "International Economic Disintegration." The most numerous bibliographical additions to the special fields were made in farm economics, public finance, labour economics, economic systems, money and banking, and business finance.

A movement was started in 1942 to devise some award that might be made to professionally trained economists similar to the certificate awarded to public accountants for certain attainments in that field. This plan received support from those who were convinced of the validity of the popular criticism launched against self-selected "economists" whose utterances and publications, because of their lack of training, their inexperience, immaturity and vested interests, reflected upon the profession of economists.

In the colleges and universities the economic curriculum was modified in two directions; a greater number of courses in war economics was offered, and courses were offered designed to assist in the professional training of women for civil service positions as statisticians and economic analysts. The Bureau of Foreign and Domestic Commerce issued a supplementary report on courses in war economics showing that of the 120 colleges and universities answering the questionnaire, 89 were offering 322 various courses on war economics and related fields. The drain upon the teaching staff into governmental service had continued to such an extent that many colleges had great difficulty in procuring properly qualified personnel to teach courses. Because of this drain and the army draft, the number of graduate students in economics fell to the lowest level since World War I.

Simultaneously with the development of war courses came the increased interest in postwar economic planning, not only in academic centres but also in civic organizations, industry and government. Reports of the National Resources Planning board related to such important issues as demobilization unemployment, the federal six-year plan for public works, federal aid of industrial research and state projects. The Board of Economic Warfare (*q.v.*) studied the hemispheric cultural and trade solidarity, export licenses, shipping priorities, monopoly purchases, and the problems related to the lend-lease policy. Increasing interest was centred in the problems surrounding the shift from full employment in wartime to peacetime full employment. (E. H. He.)

Economic Warfare, Board of.

The Board of Economic Warfare was made responsible for directing the fullest possible use of the great economic power of the United States throughout the world, to help insure the defeat of the axis.

The board became in effect the "general staff" for United States economic warfare activities. Its basic objective in 1942 was to hit the enemy wherever possible on the economic front, at the same time building the strength of the United Nations. To gain this end, exports were controlled, government programs for the procurement and importation of strategic commodities were planned and directed, and vital economic intelligence and analysis work was kept up-to-date for every country.

President Roosevelt established the Board of Economic Warfare (Economic Defense board until Pearl Harbor) by executive order on July 30, 1941. Other executive orders and legislation rounded out BEW authorities and responsibilities.

Vice-President Henry A. Wallace was named chairman of the board. Its members included the secretaries of state, war, navy, commerce, treasury and agriculture, the attorney general, the co-ordinator of Inter-American affairs, the lend-lease administrator and the head of the War Production board. Day-to-day operations were carried out by a staff of 3,000 in 1942, under the immediate supervision of an executive director (Milo Perkins in 1942).

Operating as a "board," BEW worked in very close co-operation with a number of other government agencies in 1942. In addition to the armed services, agencies with which constant operating relationships were maintained included the department of state, which handled all negotiations with other governments, the bureau of foreign and domestic commerce, the United States tariff commission, the War Production board, the Office of Pri Administration, the Commodity Credit corporation, and vario subsidiaries of the Reconstruction Finance corporation.

In addition to administrative management and legal servic the board was organized into three major operating offices line with its responsibilities: the office of exports, office of i ports and the office of economic warfare analysis. Each of t three offices was headed in 1942 by an assistant director charge—respectively, Hector Lazo, Morris S. Rosenthal a William T. Stone.

Office of Exports.—To direct the flow of commodities commercial export channels so that the power of supply cou be used as a positive economic weapon in the successful pro cution of the war was the job of the office of exports in 19 In it resided responsibilities and duties transferred to the boa from the former office of the administrator of export contr by presidential executive order of Sept. 15, 1941, includi authority to requisition certain articles and materials need for the war effort. It was the task of the office of exports control shipments of goods to foreign destinations, seeing th they did not fall into enemy hands, while at the same ti advocating release of materials that could be spared from Unit State stockpiles to help friendly countries meet their obligatio as contributing partners in the United Nations war effort and satisfying their own essential economic needs.

Office of Imports.—When, on April 13, 1942, responsibil for bringing in essential raw materials from foreign countr was centred in the office of imports, the president's execut order directed the board to administer importation of materi and commodities required for the war production effort, and ". . . determine the policies, plans, procedures, and metho of the several federal departments, establishments, and agenc with respect to the procurement and production of such materi and commodities, including the financing thereof; and issue su directives, or initiate such proposals in respect thereto as may deem necessary."

In off-shore procurement operations during 1942, the W Production board made the basic determination on United Stat need for the commodity in question, and issued the appropri directive. BEW then outlined and programmed the operati passing along specific directives to the government "buyin agency involved. This was usually an RFC subsidiary, wh carried out the direct development and purchase operatio executing the BEW directives. For some commodities, the was one of simple procurement. For others such as, for examp rubber, hemp, certain oils and minerals, the task was to deve new or additional sources of supply in areas remaining open the United States. Commodity procurement experts were litera combing the world in 1942 for materials that would help b the axis. In many countries, preclusive buying operations w under way, giving the U.S. goods it needed and preventing th from falling into the hands of enemies who also needed the

Office of Economic Warfare Analysis.—Strategy for campaigns of economic warfare was developed in the office economic warfare analysis. Working closely with the British min try of economic warfare, and using every possible source of e nomic intelligence, this office kept a running analysis in 194 the economic position of all countries, including the enemy. Inf mation thus assembled was of direct assistance to the army a navy—in blockade operations, in determining needs for supp on expeditions and campaigns and in mapping military objectiv Assistance was extended also to friendly countries in build up their economies and keeping them going. Trained technici were often sent to work with other nations, on a partners basis, in developing new sources of raw materials and stepp industrial production. Under a special project of this office, supporting service was maintained for army and navy air nsport organizations in locating, procuring and assembling itegic raw materials flown in on transport planes returning m military missions. (M. Ps.)

uador, a South American republic, located on the Pacific coast, astride the equator. Area (including the Galá- os islands, 2,400 sq.mi.), according to Ecuadorian claims prior nid-January 1942, was 337,392 sq.mi., but the settlement of a indary dispute with Peru materially reduced its area. The oulation (1941 est.) was around 3,500,000. Chief cities: Quito, capital (140,000); Guayaquil (120,000); Cuenca (42,000); bamba (21,200). President in 1942: Dr. Carlos Arroyo del Río.

istory.—During 1942 the acute dissatisfaction with the set- nent of a boundary dispute with Peru dominated Ecuador's ory. By that decision, made by the Rio de Janeiro Conference oreign Ministers, Ecuador lost a major part of the Amazonian a which it had claimed. Opponents of the administration made ch political capital of the popular dissatisfaction, and in May reatened revolt brought the arrest of several of the most dis- cted. Despite the delicate political balance, Pres. Arroyo del led his administration in a policy of wholehearted collabora- with the United States. In July Ecuador's rubber crop was, treaty, assigned to the U.S., and in September, air and naval es on both the mainland and the Galápagos islands were leased hat nation. After a visit to Washington, D.C., in November, president announced the creation of the Ecuadorian Develop- it corporation, which, with a capital of $10,000,000 loaned by United States, was to develop Ecuador agriculturally and ustrially.

efense.—The army has a peacetime strength of 7,500, with 500 reserves. United States army aviation experts had con- ted an instructing mission in Ecuador since March 1941. The y comprised one training ship in 1941.

inance.—The monetary unit is the sucre (value: 7½ cents . in 1942). The 1943 budget called for receipts and expendi- es of 150,000,000 sucres (1942: 130,800,000).

rade and Resources.—In 1940 imports amounted to $11,- ,000 (1939: $10,184,000), with the United States supplying 4% (1939: 48.7%), Japan 10.5% (5.3%), Great Britain 7.5% 5%), Italy 4.1% (3.1%), France 3.6% (4.9%), Germany % (18.1%). Latin-American countries supplied 5.5% (1939: %), with 1.4% each from Colombia and Chile. Exports, $10,- ,100 (1939: $11,514,000), not including $753,487 gold (all to United States), went largely to the United States (59.9%; 9: 49.1%). Other Latin American countries took 27.3% 39: 19.9%), with Uruguay 8.2% (entirely petroleum), Peru %, Colombia 3.6% and Chile 3.0% leading.

n the first eight months of 1942, Ecuador's foreign trade regis- ed increases in value over a similar period in 1941. The United tes, though continuing to lead all other countries in both sides the trade, took somewhat smaller amounts of Ecuadorian ex- ts. However, there was an increasing amount of trade with er Latin-American nations, especially with Cuba, Venezuela Argentina. Petroleum shipments continued to decline in 2, but the location of U.S. military bases in Ecuador brought increased local demand. The leading exports in 1940 were: ao 28.3%; cyanide precipitates 28.1%; petroleum 24.6%; ee 15.8%; rice 14.1%; copper and lead concentrates 10.5%; ua (vegetable ivory) 8.4%; bananas 6.3%.

acao and coffee are the chief export crops, bananas the third. 1942 cacao and rice crops were at the same high levels as in 1. Cotton, as in 1941, was insufficient for domestic production, sugar was barred from export, because supplies were inadequate. Balsa wood exports increased sevenfold between 1936 and 1941 (2,298 tons in the first eight months of 1941) and made further progress in 1942. Kapok (1940: 384 tons) returned strongly after the crop failure of 1941. Rubber (1940: 1,509 tons) gave promise of considerable expansion.

Petroleum (1940: 2,349,000 bbl.) output fell sharply in 1941 and continued to fall in 1942. In 1940 1,389,678 grams of gold were mined.

Communication.—External communication is by sea and by Pan American Airways, and nearly all exports are shipped through Guayaquil. Internal communication is by domestic airlines (formerly German-controlled), 600 mi. of railway, the Guayas river and a 3,500-mi. highway system. In 1942 highway construction was financed largely by the U.S. Export-Import bank. (*See* also HISPANIC AMERICA AND WORLD WAR II.) (C. N. G.)

Eden, (Robert) Anthony (1897–), British statesman, was born June 12 and was educated at Eton and at Christ Church, Oxford. After service in World War I from 1915 to 1918, he contested the Spennymoor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. He was lord privy seal and a privy councillor, 1934, and in 1935 he entered the cabinet as minister without portfolio for League of Nations Affairs, holding this post until the following December, when he became foreign minister. Disagreement with Prime Minister Chamberlain over the latter's policy of "appeasing" Germany and Italy led to his resignation Feb. 20, 1938. Upon the outbreak of war Sept. 3, 1939, he re-entered Chamberlain's cabinet as dominions secretary. On May 11, 1940, he was named secretary of state for war in Churchill's cabinet, and on Dec. 23, 1940, he was appointed to the foreign ministry again.

On Nov. 22, 1942, Eden replaced Sir Stafford Cripps as leader of the house of commons, although he still retained his post as foreign secretary. On Dec. 2, he was cheered in commons when he declared that Britain, the United States and Russia would be obliged to use their armed might after the war to prevent any repetition of aggression.

Education. For two years the slogan of education in the United States had been "Education for Defense." Under the impact of Pearl Harbor that slogan was changed to "Education for Victory," adopted as the title of the official organ of the U.S. office of education in place of *School Life* which had been inaugurated during World War I. The changed character of education was indicated in the first sentence of the first issue of *Education for Victory* on March 3, 1942: "Education has ever been in the Nation's service. But in these days of total war that service has a new significance. 'You're in the Army now' is no cliché—it is an expression of national necessity."

Leadership in education in the war crisis was at once assumed by the U.S. office of education under its commissioner, Dr. John W. Studebaker. On Dec. 23, 1941, the U.S. office of education wartime commission was created with members representing national organizations. Formed into a number of committees the commission undertook the study of the following problems: Training of teachers for non-curricular war tasks; volunteer out-of-school services by school children; curriculum adaptations in elementary and secondary schools to war needs; advancement of vocational training for defense industries; the shortage of teachers; physical fitness among college and university students; problems of women students and the war; acceleration in secondary schools and colleges; publication of information on educational changes in the interests of war service; policies for postwar edu-

STUDENTS OF TULSA HIGH SCHOOLS eating lunch with small children as part of their course in nursery-school work. Students in the home-living course prepare and serve the meals

cation and training. The creation of state educational wartime commissions was encouraged.

The U.S. office of education became the education arm of the federal government and undertook 22 major wartime services, including the following: Training of skilled workers for industrial production; training engineers, chemists, physicists, and production managers (ESMWT); training for food production and farm machinery repair; training for homemaking; vocational rehabilitation; school and college civilian morale service; inter-American education; "boom town" schools; aviation education; nutrition education; distribution of information on education and the war; and planning for postwar readjustments. For many of these activities special congressional appropriations were made. The U.S. office of education co-operated with all other defense agencies, the OCD, Federal Works agency, the treasury, in the promotion of health and welfare in defense areas, evacuation policies, creation of nutrition centres, the sale of defense stamps and bonds, school garden programs, and establishment of 25 demonstration centres for instructio in inter-American relations.

The National Education association also turned its efforts t wartime services. Through it legislative commission it wa active in urging legislation fo federal aid for education an other educational measures. Th Commission on the Defense o Democracy through Educatio was concerned with the teache shortage and salary crisis an enlisted the interest of such o ganizations as the Citizen Emergency Committee on E penditures and the National A sociation of Manufacturers. Th work of both the Public Rela tions service and the researc division was expanded, and th Committee on Education an Defense co-operated closel with officials of the army, nav Federal Security agency, offi of education, and education institutions. The Education Policies commission of the N tional Education association i sued early in the year a stat ment of *A War Policy for Ame ican Schools*. The commissio set up a series of priorities education, including the follo ing: Training workers for w industries and services; produ ing goods and services for t war; conserving materials; rai ing funds to finance the wa promoting health and physic fitness; protecting the ideals democracy; teaching the w issues, aims and progress of t war and the peace; sustaini the morale of adults and children; and maintaining intellige loyalty to American democracy. Suggestions were made of speci activities in which teachers and pupils could engage in their com munities.

The American Council on Education co-operated with oth national agencies and was especially active in focusing attenti on higher education in whose interests it was created duri World War I. Its activities are described below.

In August a National Institute on Education and the War, a tended by chief state officers of education, state directors vocational education, experts in rural and higher education, a national agencies, was held in Washington. Representatives the OPA, OCD, OWI, the army, navy and air forces, and t war savings staff of the treasury discussed the needs of their sp cial divisions. The institute recommended that opportunities provided to every youth to equip himself for the war effort order to make up the revealed shortage of specialists in the arm forces and defense industries.

In June the Institute of Adult Education of Teachers Colleg Columbia university, issued a *Report of the Commission on Po war Training and Adjustment, A Statement of Principles Relati* *the Educational Problems of Returning Soldiers, Sailors, and splaced War Industry Workers.*

ocational Training.—The chief efforts during the year were oted to increasing provisions for vocational training of work- for war industries. Vocational, trade, and technical schools ered programs running in some cases for 24 hours a day for en days a week, especially in aircraft, shipbuilding, machine p skills and automechanics, and operators of farm machinery. urses lasted from ten weeks to a year, and special provision s made for the training of engineers, chemists and physicists, dical technicians, and works managers (ESMWT) in two-year lege courses. The work in this field was carried on with federal ($141,240,000 was appropriated for 1942–43) administered the U.S. office of education, plans and policies being deter- ned by local committees. One new feature was the increase in number of women trained to take the place of men.

ew Emphases in Education.—Schools were urged to adopt nore realistic point of view in the development of curricula h special attention to more technical courses, health, and the dy of inter-American relations. Under the auspices of the il Aeronautics administration, materials were prepared in all jects but especially in science, mathematics and geography to phasize the new era of aviation that is to make America's ith "air-minded." The need of an extension of adult education s expressed. Considerable concern was aroused by the revela- n that 10,000,000 persons were found in the 1940 census to e had only four grades of education, and by the rejection on ount of "functional illiteracy" of enough young men called ler the selective draft to make up 10 to 15 combat divisions. ention was also drawn to the large percentage of illiteracy ong aliens in the U.S.

The rise of "boom towns" created a demand for schools which s met with the aid of the U.S. office of education, and the ge increase of women in war industries drew attention to the d of nursery schools for preschool children (2 to 6 years of). The WPA allocated $6,000,000 for the provision of nurs- schools to take care of 50,000 children of working mothers a charge of 25 cents per day (if able to pay this sum) for the t of food and personnel. Added to the existing provisions this n made nursery schools available for 105,000 children.

outh Problems.—A movement begun early in 1942 to abolish Civilian Conservation corps was successful despite the efforts the president and Paul V. McNutt, Federal Security adminis- tor, to save it. A small sum was provided to liquidate the C within twelve months, the equipment to be turned over to army and navy. A proposal to abolish the National Youth ninistration failed but its appropriation was cut to one-third the amount requested. Help for youth was provided in other ys—by increased appropriations to the U.S. office of education vocational training and an appropriation for student loans.

The abolition of CCC coincided with the publication of a five- r study of this organization by Kenneth Holland and Frank Hill (*Youth in the CCC*), who described it as the most im- tant educational development in 25 years and as a contribu- n to the war effort through the training provided in military its and routine, discipline of living in camps, training in activ- s needed by the army and the country, and education in the al of useful work.

The six years of work of the American Youth commission un- the American Council of Education was brought to a close the publication of a report on *Youth and the Future* by Floyd Reeves. The report, with an introduction by Owen D. Young, essed the importance of a postwar employment program for urned soldiers and young persons in order to obviate the dan- s of unrest through unemployment. The employment of all youths under 21 must be made a social responsibility; compulsory education up to 16 should be followed by a year of required work to help young persons to realize their practical abilities and needs before entering on some occupation or further schooling; jobs should be found for all able and willing to work; and consumer co-operatives, profit-sharing in business, and intelligent pricing should be encouraged to make goods and services available to the consumer. Vocational training and guidance, work experience, retention of apprenticeship, more realistic training in current problems through social studies and participation in community work, and health should be given special attention. In secondary education greater attention should be given to the needs of the students not going to college, and beyond that the number of public junior colleges and technical institutes should be increased.

Teacher Shortage.—The most serious educational problem of the year was the teacher shortage which threatened to grow. Teachers were leaving for other activities attracted by better pay than the average of $77.42 a month found in a number of states. By the opening of the school year it was estimated that there would be a shortage of 50,000 teachers necessitating the closing of 50% of the rural schools and of many schools in smaller cities. The shortage was more serious in some subjects (industrial arts, agriculture, physical education, science and mathematics, home economics and commercial subjects) than in others. Salary adjustments were made in very few instances. To correct the situation and to avoid lowering of certification standards and the employment of incompetent teachers married women teachers were urged to return to the schools, and the establishment of a nationwide teacher placement agency was recommended. To balance the exodus from the schools teachers showed an excellent record of public activities in gasoline and sugar rationing, civilian defense, first aid, salvage campaigns, and draft registration.

THE CHEMICAL ENGINEERING LABORATORY of Yale university, like the laboratories of many other U.S. institutions, was used in 1942 to give students a knowledge of explosives, synthetic rubber and other subjects vital to war and war economy

Federal Aid.—The realization, greater than ever, that equality of educational opportunity was not nationwide led to a renewed effort to secure federal aid. Senator Thomas sponsored Bill S.1313 to provide an annual appropriation of $300,000,000 to reduce inequalities of educational opportunities through public el mentary and secondary schools. The funds would be apportione to the states according to the numbers of inhabitants 5 to years of age and their personal net incomes, for the expenses public elementary and secondary schools, including kindergarte and junior colleges. Each state would determine its own metho of apportionment to the local school units. All control of educ tion would be retained by the states and local communiti Audits and reports would be required. States must continue spend for schools from state funds at least as much as in 194 and the interests of minority races must be protected where sep rate schools for separate races are maintained. (*See* for th section *Education for Victory, School and Society,* and *The Jou nal of the National Education Association.*)

Teaching of American History.—A serious educational iss was precipitated by the publication in the *New York Time* June 21, 1942, of the results of a survey of the teaching United States history in the colleges. The report of the surve based on returns from 690 colleges or 56% of those to which t questionnaire had been sent, revealed that 82% of the instit tions did not require the study of the subject and that many st dents completed their four years in college without taking a courses in American history. Further, it was pointed out that 72 of the colleges did not require United States history for admi sion. Less than 10% of the student body and only 8% of t freshmen were enrolled in courses in American history in t semester preceding the survey. Many presidents and professo of history urged that the subject should be made compulso They stressed the value of the contribution of a knowledge national history to the development of citizenship and civic sponsibility, and in the war crisis to an understanding of t democratic traditions at stake. The report had wide reperc sions throughout the country. It was discussed at a joint sessi of business men, representing the National Association of Man facturers, and educators at the annual meeting of the Natio Education association held at Denver at the end of June, a was the main topic of the address delivered by Gov. Ralph Carr of Colorado at the same convention. Speaking at the annu banquet of the state bar of Texas on July 4, Associate Justi Robert H. Jackson deplored the omission of history of the Unit States in the colleges and universities of the country and enter a strong plea in favour of the subject in "this great laboratory democracy." At a statewide conference of history professo held at Stanford university on Aug. 29, 1942, the inclusion of required "general survey in the history of the United States" w recommended in the interests of "the successful operation of democracy."

Colleges and Universities.—The outbreak of war found t institutions of higher education without plans to meet the situ tion, which was further aggravated by the failure of governmen authorities to state their needs in terms of manpower. The c leges and universities were more seriously affected than oth branches of education by the uncertainty and confusion becau of their dependence upon a student body liable to immedia call for service. Fourteen days after Pearl Harbor the planni and executive board of the American Council on Education re ommended the acceleration of students of high ability and pe formance in order to enable them to graduate before inducti into the armed forces at 20. The board stressed the point th it was essential to keep able students in schools and colleges meet the future demand for physicians, dentists, engineers a professional workers.

On Jan. 2, 1942, nearly 1,000 representatives of colleges, un versities and junior colleges met for three days in conference Baltimore at the call of the American Council on Education.

ssage was read from President Roosevelt which served as the ynote for education generally during the crisis. "We have one at task before us," wrote the president. "That is to win the r. At the same time it is perfectly clear that it will be futile win the war unless during its winning we lay the foundations the kind of peace and readjustment that will guarantee the servation of those aspects of American life for which the war fought. Colleges and universities are in the particularly diffi- t position of balancing their contributions to these two ends. m sure, nevertheless, that the leaders of our colleges and uni- sities can be depended upon to find the wisest solution for the icult problem of how to make this twofold contribution. I anxious that this national crisis shall not result in the de- uction or impairment of those institutions which have contrib- d so largely to the development of American culture."

he conference approved an accelerated program to reduce the ditional four-year course to three years or even less to be com- ted at the age of 20, and recommended that the government uld provide military training for all students physically fit service. A proposal to telescope the high school and college rses found very little support; only two leading institutions— own and Northwestern universities—announced that they uld admit qualified students at the end of their third high ool year. The proposal to accelerate courses was widely ac- ted throughout the country; some institutions merely extended all students a practice permitted only to able students. The ed-up was also helped by admitting students from high school ually at the beginning of any term or semester. Generally, vever, the four-year curricula were used by introducing an a session in summer and otherwise curtailing vacations. Al- ugh a few critics deplored the acceleration plan on educational unds, no serious difficulties were encountered in putting it into ct from the point of view of organization, and the small num- of women's colleges which were at first opposed to it accepted Two difficulties did arise, however, which had been foreseen became much more real when acceleration was put into prac- . Because of the financial conditions of most institutions of her education, which were the cumulative results of the de- ssion period, and the fact that acceleration did not increase olments, colleges and universities were confronted with the blem of remuneration to their faculties for the additional ching load imposed on them. The students were affected by introduction of extra sessions because they were deprived of opportunity during the summer vacation of earning money their education. Medical schools also adopted accelerated grams and reduced the period of training to three years, keep- their students at their studies and other activities of a pro- ional nature through the 12 months of each year. Hardest were the law schools which suffered severe reductions in olments.

he first of these difficulties was not met by any concerted . The solution of the second was made possible by a congres- al appropriation of $5,000,000 to be used for loans for about oo students who undertook training in engineering, physics, mistry, medicine (including veterinary), dentistry and phar- y. Students obtaining loans of tuition, fees, and up to $25 a th, payable through the institutions which they attended, e placed under the supervision of the War Manpower com- sion and were pledged to accept employment under its direc- during the war. The loans were to be repaid at 2½% interest. s appropriation was obviously inadequate; Dr. John W. Stude- er, U.S. Commissioner of Education, estimated that $50,000,- was needed for about 135,000 students.

y the middle of 1942 it was found that the conditions had been greatly improved. At a Second Conference on Higher Education and the War, held in Baltimore on July 15–16 the first of the resolutions adopted "deplored the continuing lack of any adequate and co-ordinated plan for the most effective utilization of higher education toward winning the war," a lack which was "impeding the flow of highly trained manpower essential to victory in a long war." The absence of a co-ordinated plan when all the institutions were ready to devote their facilities and energies to the war effort had "given rise to widespread confusion among governmental agencies, educators, students and the general public." It was accordingly urged that all the relevant governmental authorities should take steps "to assure effective and continuing co-operation between the agencies they represent and higher education." A co-ordinated plan would safeguard the permanent function of higher education to provide the nation with broadly educated and highly trained men and women in the interests of its health, safety and welfare. The major function of higher education is to develop breadth of understanding, stamina and qualities of leadership, essential characteristics of good officers. Although only 12% of the men inducted into the services were college trained, 80% of those selected for officer training had come from this group. To maintain equality of opportunity it was necessary to provide financial aid for students to enable them to take advantage of the accelerated courses without restriction of economic status, race or creed. Provision should be made to utilize those who are physically unqualified for military service but are intellectually fitted for other essential types of war service. A plan was also made for young women who have a vital part to play in the national effort.

When the academic year 1942–43 opened the confusion was not only not cleared up, but further uncertainties arose. There were doubts about the desirability of military training on the campuses, and the question whether the age for the selective draft would be lowered to 18 or 19 remained undecided for several months. Students in medicine, dentistry, pharmacy, physics, chemistry and engineering expected to be permitted to complete their courses of training. In May, 1942, the war department announced that students could enlist in the Enlisted Reserve corps of the army and be deferred from the call to active duty until graduation, "unless unforeseen circumstances dictated otherwise."

Despite the state of confusion the higher institutions of education were making important contributions to the war effort. War aid work, civilian defense work, special care for the health and fitness of students were undertaken. Every institution saw its

NORWEGIAN SCHOOL in session in a private home at Oslo. According to the Norwegian legation at Washington, D.C., which received this picture from underground sources in 1942, most of Norway's school buildings had been converted into barracks or hospitals for German soldiers faculties depleted for war work of some kind—military, civilian and research. Many institutions undertook important research work. The general trend among the students was in the direction of some form of technical preparation, a trend which alarmed those who feared for the future status of the humanities, and long-term preparation for postwar demands. In the latter area many institutions introduced courses on peace aims and reconstruction, open to the public as well as students. At least two institutions began to train specialists for reconstruction work abroad, and in different parts of the country intensive courses for the study of Arabic, Burmese, Chinese, Hindustani, Japanese, Korean, Malay, Persian, Pidgin English, Portuguese, Russian, Thai and Turkish were organized under the auspices of the American Council of Learned Societies. The study of Spanish, of Latin American culture, and of inter-American relations became widespread. One important development was the increase in the number of women taking courses in engineering, industrial management and inspection, and technical fields in general; many have already replaced men. There was also an increase of women in such subjects as home economics, nursing and nutrition.

By some it was anticipated that the war crisis would have its effects on the future of higher education in the United States. Dr. Walter A. Jessup in his annual report as president of the Carnegie foundation expressed the opinion that acceleration may lead to the permanent adoption of a three-year course in place of the traditional four. Changes in curriculum trends were also anticipated, but those might be affected differently by postwar demands for trained personnel.

The junior colleges, probably as a result of the demand for intensive training of two years, increased in number from 610 in 1941 to 627 and the enrolments showed an increase from 236,162 to 267,406 or 13.2%. Of the 627 junior colleges 279 or 44% were public and 348 or 56% private, but the public institutions had 74% of the enrolments.

Some controversy was aroused by the announcement in Jan., 1942, that The University of Chicago would award the A.B. degree after the first two years of study. President Hutchins, in defending the plan, referred to the confused organization of American education and the need to eliminate waste of time by differentiating between general and special education. For students who had neither the interest nor the ability to enter upon a course of specialized study the degree after two years would mark the end of their formal education; the remainder, improved in quality, would continue for three years more to the A.M. The plan received no support anywhere; it was charged that The University of Chicago would enter into competition with the junior colleges and was in any case cheapening the traditional A.B. degree.

As already indicated the colleges and universities were faced with serious financial difficulties. Some relief was afforded by the federal loans and other grants to students; another form of relief came from the rental by the government of buildings and dormitories for the training of officers. More serious than the immediate effects of the war crisis was the proposal by an official of the U.S. treasury to limit the deductions against estate taxes for charitable and educational bequests—a step which would affect churches, hospitals and educational institutions. It was charged that serious abuses had crept into charitable bequests, but no investigation had been conducted to demarcate use and abuse. Not only would college finances be seriously affected by such a step, but it was feared that the opportunity of the financial crisis might be an entering wedge for federal control in return for support. Equally serious was the tendency in different parts of the country to tax the property of higher educational institutions, the income of which was not used directly for educational purposes—cafeterias, dormitories, co-operative bookstores an property rented out to persons not connected with the institution

The issue of academic freedom and tenure produced only o case, that of Winthrop college, which was the subject of inqui by a committee of the American Association of University Pr fessors. The University of Georgia was dropped by still anoth national organization, the American Association of Universit Women. The Georgia case of 1941 was made an issue in the pr mary elections and helped toward the defeat of Governor Ta madge as candidate for re-election. (For this section see *Scho and Society, Educational Record, Journal of Higher Educatio Bulletin of the Association of American Colleges, Bulletin of th American Association of University Professors* and *Education f Victory.*) (For statistics of institutions *see* UNIVERSITIES AN COLLEGES.)

Anniversaries.—In May Roanoke college, Salem, Va., cel brated its 100th anniversary. Two public school systems, Detro and New York city, celebrated the centennial of the establis ment of their boards of education. Appropriate exercises marke the occasion in both cities; the Detroit board of education issue an interesting record, *One Hundred Years, The Story of the D troit Public Schools, 1842–1942*. The occasion of the 75th ann versary of the founding of the U.S. office of education in 186 was recognized as of the highest significance in view of the in portant status which this office had acquired in the war eme gency and the part that it would play in the postwar developme of education. The office in the 75 years after its creation as th National Bureau of Education had ten commissioners at its hea the first of whom was Henry Barnard.

General World Movements.—*Europe.*—In the occupi countries of Europe the nazis continued their policy of suppres ing national cultures and nazifying the national school system Nowhere did these efforts fail so signally as in Norway, whe the resistance and martyrdom of the teachers will always sta out in the history of education as one of the most heroic stan against oppression. One of the first acts of Vidkun Quislin after assuming office as minister-president on Feb. 1, 1942, w to order all teachers to join a new nazi-created teachers' unio *Laerersambund*, and as members to teach in harmony with t New Order and so become agents to indoctrinate all childr with the principles of naziism. Of the 14,000 teachers 12,000 r signed despite threats by the nazi authorities to condemn them labour service; 2,000 were arrested and sent to concentrati camps. Despite the tortures of transportation in cattle-truck lack of food, physical drill under the whip and sickness only teachers joined the *Laerersambund*. Of the remainder, 500 we herded into an old wooden ship, designed for 250 passengers, a under the most horrible conditions were transported to Kirken despite the protests even of the doctor, himself a Quisling, allow to board the ship. How many died on the voyage was n known. This treatment had no effect on their more fortuna colleagues who not only continued to resist the Quislings and t nazis, but when schools were again reopened read the "Norw gian Teachers Pledge to their Pupils of April 9, 1942," closi with the following words which deserve to be recorded for time: "I will not call on you to do anything which I regard wrong. Nor will I teach you anything which I regard as not c forming with the truth. I will, as I have done heretofore, let m conscience be my guide, and I am confident that I shall then in step with the great majority of the people who have entrust to me the duties of an educator." Other efforts at nazification the requirement of compulsory membership of all children b tween 10 and 18 in the *Ungdomsfylking*, modelled on the Hit Youth, and the compulsory use of nazi textbooks and materi of instruction—also failed. The attempt to gain control of t

higher education by appointing Quisling professors was met by the refusal of the students to attend classes. On Feb. 25, 1942, the officials and faculty of the University of Oslo sent a message of protest to the Department of Church and Education against interference with freedom of research and teaching, against education within the framework of a political party, and against compulsory youth service. (See *Norway's Teachers Stand Firm,* published by the Royal Norwegian Government's Press Representatives, Washington, D.C.)

Great Britain.—Plans for the further development and reconstruction of education in England and Wales were drafted and discussed with increasing intensity throughout 1942 by official and non-official organizations as well as by lay and professional groups. A new level was reached which carried the promise of educational reconstruction far beyond that of World War I. Nor was there any reduction in expenditures for education and the social services associated with it. The estimates of the board of education, the central authority, for the financial year 1942–43 were £57,763,118, an increase of £2,847,479 over the vote for the preceding year. It is significant to compare these estimates with those for 1933 (£41,832,562) and for 1938 (£51,002,330). Much of the increase for 1942–43 was due to the war bonus for teachers and the provision of milk and meals to children in schools. Capital expenditures almost entirely disappeared. To the estimated expenditures of the central authority must be added those of the local authorities, bringing the total expenditures up to £108,063,000 (as compared with £103,725,000 in 1941). These expenditures do not include the grants to and the expenditures of the universities and colleges.

(*See* also CAMBRIDGE UNIVERSITY; LONDON UNIVERSITY; OXFORD UNIVERSITY.)

Educationally the chief preoccupation was in the main with the care of young children and adolescents. This preoccupation was forced on Great Britain not only by the nature of the total war and the evacuation of children from their homes, but also by the increasing number of mothers who, whether voluntarily or by war regulations, were employed in war industries. The latter condition led, in World War I, to the establishment of nursery schools, which increased in the period between the two wars. After the outbreak of World War II their numbers increased with remarkable rapidity and variety. There were not only nursery schools and nursery classes but also residential wartime nurseries where young children might be left under trained care for the whole or part of the day. The major part of the basic cost of the residential nurseries was borne by the government with a small charge per day paid by the parents. It was planned to establish 1,000 such nurseries ultimately. A "daily guardian" system was also developed. The main emphasis of all institutions of this kind was on the health, feeding, play and the development of a feeling of security in the children. During 1942, a Child Care division was created in the board of education to exercise general supervision over all types of nurseries and to recruit and train teachers for them. The Child Welfare division of the ministry of health co-operated in this supervision.

For the older children already in school special measures were adopted for the care of their health and for feeding. Milk and midday meals were provided free or at cost with special attention to vitamin content and body-building foods; about 1,000,000 children were provided with meals.

The Service of Youth was further developed and expanded with the establishment of youth centres, clubs and service squads inspired by the first youth service squad organized in East Suffolk. With the registration of youth from 16 to 18 after Dec., 1941, to encourage spare-time voluntary work and training for industry, all children and adolescents were brought under educational supervision up to the age of 18. The range of activiti in which youth co-operated was constantly increasing and i addition to farm and forestry work included manning first ai and ambulance posts, air raid precaution posts, fire warden post and so on.

Full advantage was taken of the new conditions under whic school work must be carried on by evacuated children. Lack buildings and equipment stimulated teachers to develop outdo studies—geography, nature study, regional surveys and the lik Under the Camp School Act, 1939, 36 national camp schools we established and were attended in the main by pupils from 11 15; here, too, new educational interests grew up in gardenin dramatics, choirs and farm work in addition to the regular studie It was expected that this type of school would continue after th war. Disturbing as the first year of evacuation was, there wa ample evidence of improved health, physique, poise and bearin The lesson of the importance of sound health for education progress and mental security is not likely to be forgotten in th postwar period.

In no aspect of the plans for postwar reconstruction is the as clear evidence of the desire to implement the ideal of demo racy as in education. During 1942 numerous plans for educ tional reconstruction were published; chief among these were th *Green Book* of the board of education, which was not general circulated but outlines of which appeared, the *Green Book* of th National Union of Teachers, *Education, A Plan for the Futu* of the Association of Directors and Secretaries of Educatio F. H. Spencer's *Education and the People,* and *The Education* *a Community* by H. G. Stead. The chief source of informatio on most plans was *The Times Educational Supplement.* The was general consensus of opinion that the educational syste must be unified and articulated and that equality of opportuni must be provided for all children and adolescents up to 18. Nur ery schools should be provided for children from the ages of to 5, to be followed by a common primary school divided in infant school (5 to 7) and junior school (7 to 11). Seconda education is to be made available to all pupils according to the abilities in different types of schools ("modern," "gramma "technical" and "commercial") with a compulsory age limit 15 or 16 for full-time education, followed by part-time continu tion school up to 18. All types of postprimary schools are to on a parity as regards buildings, equipment, size of classes a qualifications of teachers, and fees are to be abolished in pu licly maintained schools. Private schools may be allowed continue but only under supervision by the central and local a thorities. Increased attention is to be given to health and phy cal well-being for all children up to 18, with medical inspecti and treatment and the provision of meals and clothing if nece sary. More opportunities are to be provided by means of schola ships for able students to proceed to the universities not only Great Britain but also in the dominions and the United Stat and the system of adult education is to be expanded and enriche The Service of Youth and camp schools are to be incorporat into the system. The teaching profession is to be unified, t preparation of teachers to be improved, and salaries to be pa on the basis of qualifications. Basic to the whole plan would concentration of everything relating to education in the hands the board of education as well as of local education authoriti reorganization of the local authorities themselves, and reform the system of financing education.

On the basic recommendations there was general agreeme There was no unanimity on plans for the preparation of teache while some recommended the single "multilateral" seconda school instead of a variety of schools at the postprimary lev The proposals were not as radical as might appear; they gradua erged out of discussions, surveys, and reports which began dur- World War I.

The world situation of 1942 was reflected in the movement, nulated by the board of education, to teach the history of the ited States in all schools.

To this end courses were organized for teachers and a number textbooks appeared, among them one by Professor Allan vins of Columbia university. (I. L. K.)

The goal for production of eggs in the United States in 1943 was set by the Office of Agricultural War Relations 4,780,000,000 dozen, 8% above the estimated production of 2. Military and lend-lease requirements for dried eggs in- ised substantially in 1942, and it was estimated that the ivalent of 1,220,000,000 dozen eggs would be needed to meet demand in 1943. Eggs in cold storage decreased heavily in latter part of 1942, and at the end of the year had reached lowest quantity on record, excepting the end of 1932. Shell s in storage Jan. 1, 1943, were reported as 259,000 cases of dozen each, compared to 549,000 cases Jan. 1, 1942.

condition favourable to expanded egg production in 1943 the fact that the average quality of laying stock had im- ved over that of 1942 and previous years. Approximately 82% he new laying stock hatched in 1942 was from commercial cheries, compared with the previous high record of 77%. The ch in 1942 was earlier than usual. The number of layers ally declines during the summer moulting season of low pro- tion. The low point of August, 1942, was 287,000,000 layers arm flocks. In Nov. 1942, there were 373,000,000 layers, an ease of 10% over the same period in 1941. At the same time, production in 1942 increased 17% over that of 1941 in the e period. Obstacles in the way of increased egg production at end of 1942 included the danger of larger laying flocks over- vding a number of hen houses, thereby increasing the possi- y of loss from disease and necessitating closer care of flocks. iculty in obtaining animal proteins for laying rations was ap- ent in some areas. Wholesale prices of eggs were included in OPA general freezing order of Oct. 5, 1942. Farm prices, ever, advanced, rising on an average from 37.4 cents in mid- ober to 38.9 cents in mid-November. Although permanent ngs were not established for eggs in 1942, announcement was le that they would be established later and that the price port program would raise the average of farm prices for eggs 943 at least 15% higher than in 1942. uler, King Farouk I; premier, Mustapha Pasha Nahas b. 5, 1942); language, Arabic; religion, Mohammedan 91%; t 7%.

History.—The government of Hussein Pasha Sirry resigned in . 1942. The possibility of setting up in its place a national ernment to include the Wafdists was considered, but the Wafd ised to take part, and Nahas was called upon to establish a purely Wafdist government. The Wafd undoubtedly commanded the support of a very large majority of the people and Nahas was the statesman most likely to steer the country through the difficult times which inevitably lay ahead. The Wafd had boycotted the previous parliamentary elections, and Nahas insisted on the election of a new parliament. The elections were held in March and, with the Liberals and Saadists taking no part, the Wafd obtained an overwhelming majority in the chamber of deputies. The program of the new government was ambitious and comprehensive; it included on the one hand measures for improving the standard of living and on the other proposals for the increased efficiency of the army and air force. Nahas on more than one occasion after assuming office expressed his determination to uphold the Anglo-Egyptian treaty which he was himself instrumental in concluding; and while he said that he would never agree to Egypt's actively entering into the war, he made it clear that he would not tolerate interference with Britain's task in bringing the war to a successful conclusion. The government had to face serious problems concerning the internal welfare of the country, the most urgent being the rise in the cost of living and the scarcity of certain of the essentials of life. Meatless days had made their appearance some time before; difficulty in obtaining adequate supplies of grain and sugar were experienced by the poorer classes; and the prices of necessities rose alarmingly. Axis propaganda seized the opportunity to ascribe the shortage to the demands of the allied armies. The other side of the picture is shown by the fact that the British military authorities made available to the Egyptian government stocks of army grain until the harvest was reaped. The presence of the allied armies in Egypt brought money into the country, but it did not find its way to the fellahin who, of all classes, were the most seriously affected by the rise in prices. Some steps had already been taken by the government and more were projected. Of first importance was the requirement that more food crops should be grown instead of cotton; this was found to be essential in the last war but the lesson then learned was tardily applied; other measures entailed the control of exports and the regulation of prices. The temporary setbacks to the allied armies which brought the enemy to the very gates of the delta were faced without panic by the ordinary Egyptian. Nahas took the opportunity to deny that Egypt had been urged to take an active part in the war and to warn the people against subversive activities. The millenary of El Azhar university was

SOUTH AFRICAN patrol taking shelter during enemy mortar fire on the Egyptian front in 1942, before the great British offensive got under way Oct. 23

A CONSTANT WATCH over the Qattara depression was maintained by the British for four months after they retreated to El Alamein, Egypt, July 1, 1942. Although the sunken mud flats were generally considered impassable, the 8th army took no chances with a German surprise attack on its left flank

to have been celebrated in September, but the ceremony was postponed owing to the indisposition of the king. For the German invasion of Egypt and the British counterstroke, *see* WORLD WAR II.

Eire.

Eire is the southern portion of an island to the west Great Britain, extending from 51° 26′ to 51° 21′ and from 5° 25′ to 10° 30′ W. Under the constitution, opera since Dec. 29, 1937, the name "Irish Free State" given by treaty of 1921 to the 26 counties and four of the county borou of southern Ireland, was replaced by that of "Eire", or Irela President: Dr. Douglas Hyde (*de h-Ide*). National flag: the colour of green, white and orange.

Area and Population.—Area 26,601 sq.mi.; pop. (est. J 30, 1942) 2,963,000. Chief towns (pop. register 1941): Du (cap., 489,276); Cork (76,758); Limerick (42,522); Dun La haire (41,924); Waterford (28,481). Languages: Irish and F lish; religion: Christian (Roman Catholic 93%).

History.—Inevitably the year 1942 was one of increasing nomic stringency. Already in Oct. 1941 a national register rationing purposes had been compiled. By the new year it become plain that the wheat supply was insufficient, and on 7, 1942, Sean Lemass, minister for industry, commerce and plies, announced that it would be necessary to import 80 tons. During the next month 12 ships were bought or charte by Irish Shipping Ltd., with the result that by June the br situation had eased considerably. In February, after some ag tion, the price of home-grown wheat for the 1942 season raised from £45 to £52 a barrel; this was possible only by me of a subsidy of more than £800,000 to keep bread prices do In April it was found necessary to compel 100% milling of wheat. Butter supplies were also low because of increased sumption owing to shortage of other fats. In February r deliveries were cut by 12½% and by autumn the price of to farmers had to be raised to 9*d.* a gallon in order to en production. There were many other restrictions such as those paper and electricity, but the most serious crises arose over g line and clothing. On May 1 all private motoring was forbid and the use of motors by doctors and clergymen severely stricted. On June 9 a clothes-rationing order caused a dra demonstration strike in Dublin. The coupon system thus ina rated was extended in October to soap. Severe measures taken against the black market, and a bill was passed impo minimum fines. In spite of all this, and especially of a chr difficulty over transport, conditions continued fairly easy, there was a record internal tourist traffic during the summer

internal politics the most striking event was the resignation
James Dillon, on Feb. 19, from the vice-presidency of Fine
l, the chief opposition party. This followed a speech to the
y's annual congress in which he deplored the fact that Eire
not fighting with the Allies. William Cosgrave and other
ers at once reiterated their adhesion to the government's
rality policy, which had been several times re-stated by Prime
ister De Valera, notably on the entry of the United States
the war and in a Christmas Eve broadcast to the U.S.A. On
27 the Taoiseach declared that his government had not been
ulted about the dispatch of U.S. troops to Northern Ireland.
ing January and February there was much discussion about
trial of four I.R.A. members for the murder of a man named
ereux. One of these, named Plant, was executed on March 5;
were sentenced to penal servitude for life. I.R.A. activity
seemed to lessen, as far as Eire was concerned, until Sep-
per, when a detective named O'Brien was shot as he left his
e in Rathfarnham.

gislative measures were few during the year; the chief were
ct to provide for the conduct of the referendum on constitu-
al issues, and an act establishing a central bank, which was
ted from March to October. Municipal and local elections,
in August, indicated a severe decline in the strength of the
rnment party. (M. T.)

lucation.—In 1940–41: elementary schools 5,076; scholars
245; secondary schools 352; scholars 38,713; universities:
onal, 4,039 students; Trinity college, Dublin, 1,391.

1) 74,656; (July 31, 1942) 55,000.

nhower, Dwight D. (1890–), U.S. army officer,
was born Oct. 14 at Denison,
He was admitted to West Point, graduating in 1915, and
g World War I was an instructor at several U.S. army
s. After graduating from the Army War college, he served
e office of the chief of staff in Washington. In 1935, he went
e Philippines as Gen. MacArthur's chief of staff and helped
the commonwealth's defenses. Chief of staff during the
army manoeuvres in Louisiana, he was later moved to
ington as chief of the general staff operations division. In
1942, Gen. Eisenhower was given command of the newly-
lished U.S. headquarters in England for the European the-
of operations and was promoted to the rank of lieutenant
al. On Nov. 8, 1942, he led a huge force of U.S. troops
h landed in French North Africa. Even as his troops were
swarming ashore, Gen. Eisenhower appealed in a broadcast to the French armed forces to co-operate with his armies in ousting the Germans and Italians from Africa. He subsequently concluded a politico-military arrangement with Adm. Jean Darlan to join the Allied cause. This deal was credited with having saved many American lives in the African invasion, but was also criticized as a short-sighted policy which discouraged the pro-democratic underground factions throughout conquered Europe.

Elections. The mid-term elections of Nov. 3, 1942, the first wartime national elections held in the United States since 1918, gave the Republican party a substantial increase in its representation in congress and the states. In the gubernatorial contests, the Republicans scored a net gain of 3, raising to 23 the number of Republican governors. In the senate, they won 9 additional seats, with no losses, and in the house they achieved a total of 209 seats, only 9 short of a majority of that body. The political subdivisions of the new congress, the 78th, were as follows: senate, 57 Democrats, 38 Republicans and 1 Progressive; house, 222 Democrats, 209 Republicans, 2 Progressives, 1 Farmer Labor and 1 American Labor.

Quantitatively, the Republican victories were greater than those registered in the wartime elections of 1918, when the party gained 21 house and 6 senate seats, and gave the Republicans their largest representation in the national legislature since the 72nd congress (1931–33).

Since candidates of both parties supported the national war program, the election results were to be interpreted as reflecting popular dissatisfaction with the administration's conduct of the war, and certain of its policies on the home front, rather than as a vote of protest against the entrance of the United States

THOMAS E. DEWEY visiting a county fair in New York during his campaign for the governorship of the state in 1942. He was elected by a plurality of more than 600,000 on Nov. 3, 1942

Keith Temple

"CALL FOR ACTION ON THE HOME FRONT!" A plea by Temple of the *Times-Picayune* (New Orleans) to turn out politicians who in 1942 placed selfish interests above national safety

into the global struggle to defeat the axis. Among the factors contributing to the Republican gains were: (1) resentment of many voters over rationing, and restrictions on the sale of gasoline; (2) dissatisfaction with the progress of the war; (3) resentment of farmers in the midwest, where the Republicans won their biggest gains, over the efforts of the administration to keep farm labour costs out of the farm parity price formula; (4) a widespread feeling that the administration had shown too much favouritism toward organized labour; and (5) a protest against government regimentation and the expanding federal bureaucracy.

Though these factors explained the trend away from the party in power, the influence of personalities and local issues played an important part in determining the outcome in many individual contests.

The Governors.—Including the Maine election on Sept. 14, in which Sumner Sewall, Republican, was re-elected governor by a majority of approximately 58,000, there were 33 gubernatorial contests in 1942. Of these the Republicans won 18, the Democrats 14 and the Progressives 1. This one was in Wisconsin, where Julius Peter Heil, Republican, was defeated by Orland S. Loomis. The other Republican loss was in Wyoming. Republican governors displaced Democrats in five states—New York, California, Michigan, Connecticut and Idaho. Republican governors were re-elected, or succeeded other Republicans in New Hampshire, Vermont, Massachusetts, Pennsylvania, Ohio, Minnesota, South Dakota, Iowa, Nebraska, Kansas, Colorado and Oregon. Democratic governors were elected in six southern states, and in Arizona, New Mexico, Nevada, North Dakota, Oklahoma, Maryland and Rhode Island.

In point of national interest, the most important gubernatorial race of the year was that in New York state, where Thomas E. Dewey, Republican, defeated the Democratic candidate, Attorney-General John J. Bennett, Jr., by a plurality of about 630,000, thereby becoming the first Republican governor elected in th state in 20 years. The Republicans made a clean sweep of th state elections, winning majorities in both houses of the legisl ture. Dean Alfange, gubernatorial candidate of the America Labor party polled more than 400,000 votes. Lieutenant Govern Charles Poletti, Democrat. who also had the nomination of th American Labor party, failed of re-election by only 54,000 vote running 600,000 votes ahead of Bennett, the Democratic cand date for governor.

Other important gubernatorial contests were in Connecticu where former Governor Raymond E. Baldwin defeated the Dem cratic incumbent Robert Hurley; in California, where Ea Warren, Republican, was elected by a plurality of about 260,0 over Governor Culbert L. Olson, and in Michigan, where Har L. Kelly defeated Democratic Governor Murray D. Van Wagon by a margin of about 68,000. Three Republican governors we elected for third terms—Leverett Saltonstall of Massachusett Harold E. Stassen of Minnesota and John W. Bricker of Ohi

Though Governor Julius P. Heil, Republican of Wisconsin, w defeated for re-election by a Progressive, Orland S. Loomis, 109,000 votes, the state elected a Republican legislature. Loom died soon after his victory at the polls. His death was a bl to the Progressives in Wisconsin, who had not won a state-wi election, with the exception of the re-election of Senator Robe La Follette in 1940, since 1936, when Philip La Follette w elected governor. The vacancy caused by Loomis's death was fill by the Republican lieutenant governor, Walter S. Goodlan under a ruling made by the state supreme court on Dec. 29.

The Senate.—Thirty-six senatorial elections were held 1942. One of these, the Maine election in September, result in the re-election of a Republican, and three others (in Colorad Minnesota and West Virginia) for unexpired terms, were al won by the Republicans. Of the 32 elections for full six-ye terms, the Democrats and Republicans each won 16.

Among the more important Republican senatorial victor were those of Kenneth Wherry over the veteran Senator Geor W. Norris, Independent in Nebraska; of Chapman Revercor over Governor Matthew M. Neely in West Virginia; of Edwa H. Moore over Senator Joshua Lee in Oklahoma; of Hom Ferguson over Senator Prentiss M. Brown in Michigan, a Senator Henry Cabot Lodge over Representative Joseph E. Cas in Massachusetts. In New Jersey, the Hague machine suffere reverse in the election of Albert W. Hawkes, Republican, o Senator William H. Smathers, Democrat. West Virginia a Oklahoma both elected Republican senators for the first ti since 1928. Charles L. McNary of Oregon, Republican sen leader, was returned in the only senatorial election held in Pacific coast states.

Outside the solid south the Democrats elected their senator candidates in Colorado, Rhode Island, Montana, New Mexi Nevada, Tennessee and Kentucky.

The House.—In the elections for the house, Republican can dates made a gross gain of 49 seats, displacing Democrats in contests, and a Progressive in 1, winning 3 additional seats new districts created as a result of reapportionment. Democr displaced Republicans in 5 contests and the Republicans another seat in Illinois through the elimination of a district large, giving them a net gain of 43 seats.

The Votes.—The total vote in the house contests, accord to an estimate made by the Associated Press on Dec. 24, foll ing a tabulation of final official figures, was only 28,111,583, smallest in any national election in 22 years, and nearly 22,0 000 less than in 1940. The total of the highest vote in each st whether for senator, governor or representative at large, or combined district votes for representatives, was 30,024,927, lest since the 1924 presidential contest.

the congressional vote, the Republicans polled 14,217,320, .6%; the Democrats polled 13,331,245, or 47.4%, and other es 563,018, or 2%.

the last off-year elections, in 1938, the Republicans re- d 47.3% of the total votes cast, 36,203,133, as compared 49% for the Democrats, other parties polling 3.7%. In 1940 Republicans received 44.8% of the total as against 54.7% he Democrats, and 0.3% for other parties.

e Republicans polled 54.7% of their 1942 congressional vote midwestern states—Illinois, Indiana, Iowa, Kansas, Michi- Minnesota, Missouri, Nebraska, North Dakota, Ohio, South ota and Wisconsin. These states provided nearly half of the ublican house victories—103 out of 209. The Republicans d 23 seats in this region over 1938 while the Democrats 29. In 1942 this area sent only 25 Democrats to the house. the east, the Republicans elected 79 house members, com- l with 74 in 1938; the Democrats 53, as compared with 61. e far west the Republicans won 23 seats, as compared with 1938, and the Democrats 26, against 34.

tside the solid south, the Democrats won a majority of the ressional vote in 10 states—Arizona, Kentucky, Maryland, tana, Nevada, New Mexico, Oklahoma, Rhode Island, Utah Washington.

e Primaries.—The primary elections held earlier in the year led no clear-cut political trend. For the most part, local, r than national issues decided the outcome of these con- Nor was there any evidence that a record of pre-Pearl or noninterventionism operated as a serious obstacle to sentatives and senators of either major party in seeking re- nation. Representative Hamilton Fish, Republican, a lead- ritic of the administration's foreign policies, who was op- l both by Wendell L. Willkie and Thomas E. Dewey, won nination in the 26th New York district (President Roose- district) by a 2 to 1 majority. Other noninterventionists won their primary battles included Senator John W. Thomas, ocrat of Idaho; Representative John M. Vorys, Republican io, and Representatives William B. Barry, James A. O'Leary Martin J. Kennedy, Democrats of New York.

ong the noninterventionists defeated in the primaries were or William J. Bulow, Democrat of South Dakota, and Rep- tative Martin L. Sweeney of Ohio. Three Democratic sena- 15 Democratic and 7 Republican representatives were de- d in the 1942 primaries.

e comparatively small vote cast in the 1942 elections might tributed principally to three factors: First, the absence in rmed forces, many of them overseas, of 5,000,000 or more of voting age; second, the migration from their home states illions of workers in war industries; third, the preoccupation large portion of the electorate with their war jobs, and a ting apathy or indifference toward domestic political con-

e total vote polled by the Republicans in the house con- was 8,000,000 less than in 1940, and nearly 3,000,000 less in 1938, the last off-election year. The Democrats suffered greater losses, a drop of 14,000,000 votes from 1940, and y 4,500,000 less than their 1938 total. In the light of these es, defections from the Democratic party, rather than an ab- e increase of popular support for Republican candidates ed to explain the results of the 1942 voting. (O. McK.)

ctrical Industries.

In spite of numerous predictions of impending power shortages the 1942 was plainly one of growth deceleration for the electrical stry in the U.S. As the war changed the internal economy of the nation the effect was apparent in the use of current. The production of electricity in 1942 amounted to 188,500,000,000 kw.hr., an increase of 20,000,000,000 or 12%. The previous year, however, the output had increased 23,000,000,000 or 16½%.

Thirty per cent of this increase came from government-owned systems, although their total output was but 14.3% of the aggregate for the country. Gradually these publicly owned systems (municipal and federal) were becoming a larger part of the nation's utility industry. In 1941 their ratio to the total output was 13.2%.

In spite of the increasing deficiency of power supply in Canada, imports to the United States increased 50% to 1,500,000,000 kw.hr.

Two-thirds of the 1942 production or 125,300,000,000 kw.hr. were produced for fuel but only 40% of the increase came from fuel. Hydro, which supplied 60% of the increase, generated 63,200,000,000 kw.hr. The difference was large only because hydro was down so far in the previous year due to the unprecedented drought along the eastern seaboard.

The year showed a continuation of the improvement in efficiency which started seven years previously. Losses which previously used to run at the rate of one in every six kw.hr. generated were down to less than one in seven.

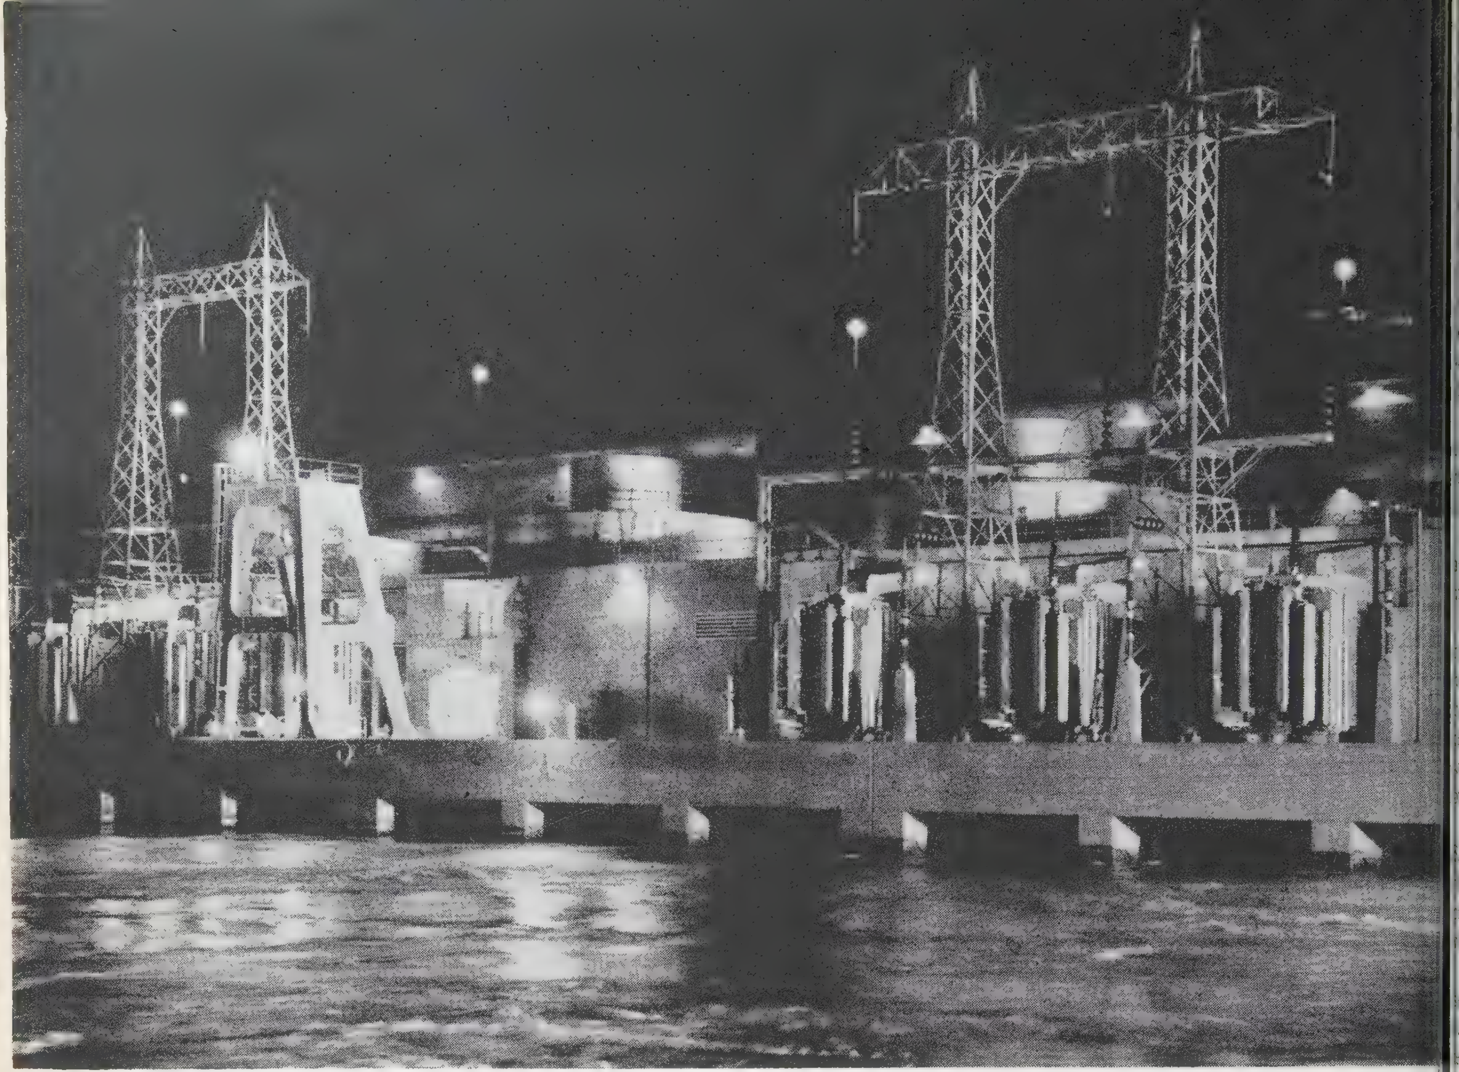
Generating capacity increased 2,700,000 kw. to a national total of 46,812,000 kw., of which fuel accounted for 33,538,000 kw. or 71.7% and water 13,274,000 kw. or 29.3%. This was a new high for hydro ratio and reflected the federal hydro construction program.

Of the total capacity of the country, 38,716,000 kw., or 82.8% was privately owned against 84.2% the year before; government owned was 8,096,000 kw. or 17.2% against 15.8% in 1941. Ten years ago the government owned aggregate was 2,423,000 kw. or but 6.7% of the total.

Of the new generating capacity added in 1942, 1,658,000 kw. was for privately owned companies and 1,125,000 kw. for government owned. This was the third largest annual addition in the history of the industry.

Due to the round-the-clock operation of war plants, the utility load factor improved during the year. On the average each kilo-

TESTING a 600-watt aeroplane headlight developed in 1942 to illuminate runways during landings on blacked-out fields



WATER rushing from the draught tubes of Wheeler dam, near Florence, Ala., in the Tennessee Valley Project area. The generating capacity of the TVA system was increased by 50% in 1942 to supply electrical power to U.S. war industries

watt of capacity was used 4,147 hr. This was the first time that 4,000 hr. was exceeded. Fuel generation was used 3,834 hr. and hydro just missed 5,000 hr., going to 4,949 hr. Just the increase in the load factor was responsible for half the increased output.

The increased use of hydro power brought a greater improvement in fuel economy because a lessened necessity to use old and inefficient steam stand-by units. The coal consumption per kilowatt-hour dropped three points in 1942 to 1.31 lb.

In excess of 68,000,000 tons of coal were used, 16,600,000 bbl. of oil and 228,500,000,000 cu.ft. of gas. As a result of conversion from oil to coal burning the utilities used 3,666,666 bbl. of oil less, or nearly 20%.

The utilities met their December peak with 110 days' supply of coal in storage—the largest storage ever carried. Normally about half this number of days' supply was sufficient.

Water storage was good all over the United States and for municipal and power and industrial use was around 80% greater than it was in 1941.

The sum of the non-coincident December peaks equalled 33,357,585 kw., an increase during 1942 of 1,800,000 kw. or 5.66%. The increase in peak the previous year, however, was twice as great, or nearly 13% again, indicating a deceleration of growth.

The reserve based on dependable capacity as defined by Federal Power commission was 209 kw. per 1,000. In Dec. 1941, it was 183 kw. Dependable capacity in Dec. 1942 was 6,500,000 kw. less than total installed capacity. This gives an extra reserve except under the most unusual circumstances of nearly 20%, making 40% in all.

Sales to ultimate consumers reached a total of 158,800,000 kw.hr., made up as follows: rural, 2,900,000,000; residential, 000,000,000; small light and power, 27,350,000,000; large and power, 88,000,000,000; street and highway, 2,000,000, electric railways, 4,200,000,000; electrified railroads, 2,400, 000; municipal and miscellaneous, 4,950,000,000.

The large light and power which is largely the heavy indu increased usage but 8,000,000,000 kw.hr. against 16,500,000 in 1941. This further indication of decelerated growth bore the statements from WPB that the war production industries about finished their expansion program.

Residential usage continued to grow, in spite of curtailed m facture and sales of appliances due, of course, to the energy by the record-breaking sales in 1941, the comparative usag fects of which were not felt until 1942. Incidentally, ave residential usage exceeded 1,000 hours in 1942 for the first tim

Small light and power continued to show improved growt spite of the heavy mortality among retail stores. The reason in the fact that this group contained large numbers of smal dustrials which had converted and gone to longer hours.

The effect of tire and gasoline rationing was seen in the pi in usage by street railways, a market which had gradually decreasing for years. Decreased consumption by street and way lighting of some 5% was due to year-round war time ar dimouts.

Revenues were up 7.6% to $2,850,000,000 but again sh the deceleration in growth previously mentioned. In spite o greater war production load, the relative position of other changed little during the year, so that, in general, the rev position was not greatly affected.

The revenue per kilowatt-hour used in residences again went wn this time by .06 cents to 3.67 cents.

Expenses decelerated in every department except taxes which reased by $124,000,000 to 24.1 cents per dollar of revenue. perating ratio before taxes was but slightly larger than in 1941 38.6 against 38.4—but after taxes the ratio was 62.6 against .9 for the previous year. Salaries and wages were 12.6 cents r dollar of revenue against 14.9 cents in 1941; maintenance and neral operating expenses were up 2.1 cents, fuel up 0.4 cent d miscellaneous 0.2 cent. Dividends and surplus fell from 18.3 14.1 cents.

The number of customers at the end of 1942 showed an in-ease of over 600,000. Of these, 116,000 were rural and 590,000 sidential customers; commercial and industrial showed losses of arly 100,000 due to the restrictions of civilian economy.

At the end of 1942 there were 32,215,888 customers classified follows: Rural, 1,102,892; residential, 26,616,400; commercial d industrial, 4,372,657 and others 123,939.

The Rural Electrification administration reported a total of 10,000 consumers connected to the lines of co-operatives. It d 797 systems in operation with a total of 378,000 miles of es and 60 generating plants totalling 57,500 kw. These sys-ns generated 130,000,000 kw.hr. and purchased 1,300,000,000 .hr. They sold 1,140,000,000 kw.hr. for $47,200,000. The rchased energy cost $11,530,000, or just under 9 mills per kw.hr.

Capital expenditures for privately owned utilities only were 74,000,000 or about three-quarters of the amount budgeted at beginning of the year. For 1943 the budget for the private mpanies was down to $270,000,000. Of this amount, one half s allocated to generation.

In spite of the reduced capital expenditures, approximately the me amount of new capital was sold as in each of the two pre-ous years, just under $100,000,000. Refunding sales fell off to s than half, leaving the year's financial operations at $351,-0,000, the lowest since 1934.

Output of electrical manufacturers in 1942 was up 50% against 19% increase in the Federal Reserve Board Index of general lustry production. The total for the year is estimated to have ached $7,000,000,000. Production index reached 46.1 (1925=0) and orders received index went up to 529, an increase of arly 60%.

Sales of industrial apparatus were greater by 52%, transmis-n and distribution equipment by 23% and insulated wire and ble by 5%. Because appliance production was halted early in e year no production figures are available for this class of ma-rial. Inventories were up to 300 (December 1938=100); ship-ents at the end of the year had passed the 300 index mark for e first time.

The year saw few developments of any note in new devices or uipments. Old equipment was salvaged and substitutes used herever needed. Wood replaced steel for line construction, steel placed copper for some lines. Silver (100,000 tons of it) was ed in place of copper for bus bars in government war plants. y employing cooling methods of one kind or another equipments nerally were run at higher than rated loads.

Commercial activities were confined to helping the customer ercome war difficulties. Meters were more and more read on e bi- or tri-monthly plan and more and more billings were ade bi-monthly.

War Production board limitations further restricted the use of aterial for extensions. Order L-94 defined the operations re-uired if and when a power shortage area developed. Utilities arted regional integration through power pools, thereby adding over 1,000,000 kw. of reserve power to dependable capacity.

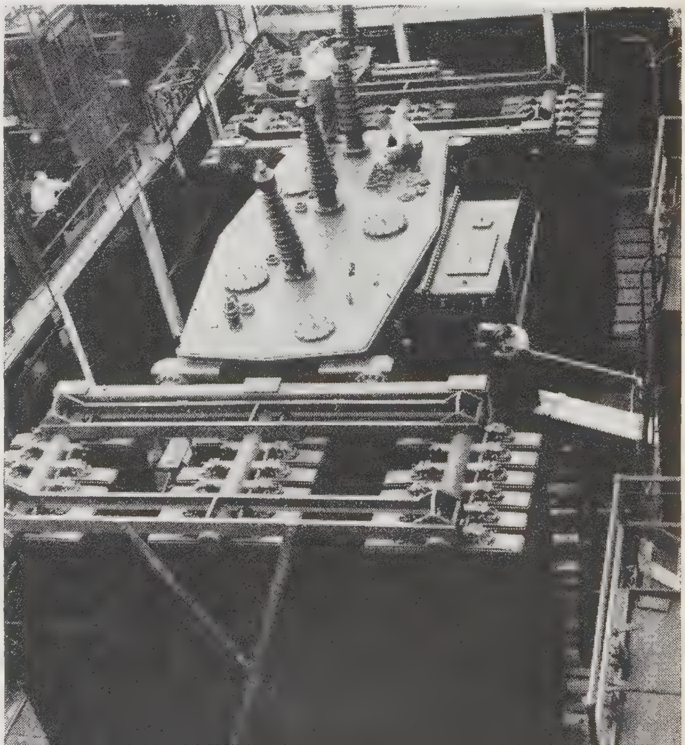
The operations of the Holding Company act were evident in a large number of split-offs from the parent company. Some of these were purchased with public funds, REA buying a number of the smaller operations, but a good many were taken by neighbouring utilities.

There was considerable new rate regulation but not many rate changes. Prudent investment got a good start as the result of the supreme court ruling modifying the fair value theory. OPA established its right to intervene in rate-raise cases.

Lighting.—Due to restrictions on the use of materials, all lighting activity not directly related to the war effort was greatly reduced or discontinued. Except for rulings in dimout areas and some municipal efforts to save money spent on street lighting there was no order reducing the amount of civilian lighting. Industrial lighting, on the other hand, went forward rapidly, both in the lighting of new war plants and in the relighting of converted factories. During 1941 and 1942 more than 1,200 installations of 50 ft.-candles and over were reported.

Studies were made of industrial lighting maintenance which gave an operating figure of 66% of initial ft.-candles. The large areas worked on in some war plants gave rise to problems of vertical lighting. One of the solutions was white cement floors which gave an increase in vertical illumination over gray cement of 20%. Fluorescent lighting continued to show large acceptance with a trend toward mercury and combination systems for high bays. Some new circuits for fluorescent lighting were brought out to reduce the amount of material used. Rectified fluorescent, because of greater use of material, was dropped for the duration. Restrictions in the use of steel for fluorescent fixtures gave rise to the use of non-metallic painted reflectors. No street lighting extensions were permitted except to war plants and camps. The double-ended rotating airway beacon was replaced by an all-glass prismatic globe. Lumiline stocks were frozen and many types of lamps were redesigned to save materials. Photoflash lamps were further simplified.

Because of industrial use, the 100-watt fluorescent lamp showed the greatest increase in sales but the 40-watt size still leads at approximately 60% of the total. Life of the 100-watt lamp was increased from 2,500 to 3,000 hours. Progress was made in improving colour uniformity, reducing blackening and eliminating



ANT 257-TON TRANSFORMER built in 1942 at Sharon, Pa., for a U.S. war ant brown rings.

Several new lamps were introduced as the result of the war. The most significant was the blackout lamp to provide starlight values, a 14-watt lamp for indoors and a 9-watt lamp for outdoors. With them went blackout lighting units also. There were no new lamps for the dimout but collars were devised to further shield street lamps and specifications set up limiting the amount of light that would shine out from show windows. To measure these low values of illumination down as far as 0.000005 foot lambert new low brightness meters were devised.

Several new units and lamps were designed for aviation service both for the fields and the machines. A large bomber, for instance, was to employ 24 different types of lamps for a total of over 100 units.

Blackouts gave rise to an improved red photo flash lamp while rough manufacturing such as shipbuilding caused a rough service lamp to be designed.

A number of new designs of lighting systems were being tried out as the year was closing, including 406-volt series street lighting for interiors and totally indirect for high bay industrials. Cold cathode lighting appeared to be increasing in number of installations and some improvement in new incandescent installations was noted. (*See* also CENSUS, 1940; PUBLIC UTILITIES.)

Electric Transportation.

All forms of electric transportation in the United States and Canada were greatly affected by the World War in 1942. The effects, however, were quite different for the four major types of service. The electrified trunk line railroads experienced greatly increased traffic, but were not able to make any extensions of their trackage, nor any important additions to their equipment, as material was not available for such purposes. The subway and elevated rapid transit lines experienced few changes in their operations. No additional trackage was placed in service, and no great change occurred in the volume of riding. Some elevated railway lines which were no longer in use were demolished in order to obtain steel for war purposes. The street and interurban electric railways had large increases in riding due to the decreased use of private automobiles. There were some extensions of trackage and some new equipment was put in service, but, in general, the effect of the war was to cause more intensive use of existing track and equipment. Electric trolley bus operation, which had been expanding steadily before 1942, remained almost stationary, the principal change being a moderate increase in patronage. Because of the war, accurate information was not available concerning electric transportation developments outside of the Unite States and Canada.

Table I.—*Electric Transportation Equipment as of Jan. 1, 1942*

Population of Cities	Passenger Cars			Trolley Buses
	Surface Railways	Rapid Transit	Suburban Railroads

Canada	1,747	..	..	16
Grand total	16,994	1,217	4,074	2,121

Regulation.—Government regulation of transportation was e tended to an unprecedented extent in 1942. The Office of Defens Transportation, created by President Roosevelt in 1941, wa given authority over all forms of rail, highway and inland wate way transportation in the country. Previously the Intersta Commerce commission had exercised authority over comm carriers operating in interstate commerce, but the ODT was give far wider powers, including private as well as public transportation, and intrastate as well as interstate operations. Early in th year a special department of ODT was created with the designation of division of local transport. In Canada the Office of Trans Controller was given powers generally similar to those of th local transport division of ODT in the United States. Both offic followed policies of a generally similar character.

Table III.—*Passengers Carried in 1941*

Population of Cities	Electric Surface Railways	Rapid Transit Railways	Electrified Suburban Railroads	Trolley Buses
Over 500,000	4,503,350,000	2,296,292,000	..	183,700,00

Total for United States	6,171,798,000	2,296,292,000	164,863,000	616,640,00

Statistics for electrified trunk line railroads are not available for presentation in th form.

The basic reason for the establishment of governmental contr over local transportation was the shortage of rubber for autom bile tires and the consequent necessity for the adoption of a ne philosophy among people who had become accustomed to us automobiles widely for both pleasure and business travel. A pr gram sponsored by ODT included the following major points: (1 encouragement of walking instead of riding; (2) use of publ transportation wherever possible; (3) establishment of stagger hours for factories, offices and schools to permit public trans facilities to handle a larger number of passengers; and (4) form tion of share-the-ride groups to utilize private autos more effe tively where public transportation was not available.

This program had a far-reaching influence on electric tran portation. Many people who had previously used private autom biles shifted to street cars and rapid transit. The trend which ha formerly existed toward the substitution of motor buses in pla of electric rail cars was halted, and in some instances even r versed. Hundreds of electric rail cars which had been in storag for years were overhauled and put back in service. A substanti mileage of track on which electric railway service had been su pended was restored to operation. Change-overs from electr railway to bus operation were forbidden by ODT for the durati of the war.

Traffic Trends.—Paralleling the ODT program was the esta lishment of gasoline rationing for automotive vehicles. This wa done on the eastern seaboard in May and throughout the United States in December.

The result was a further shift from private to public transportation.

The best available figures indicate that the transit industry in the United States carried about 19,000,000,000 passengers in 1942 as compared with 14,333,000,000 in 1941, an increase of approximately 30%. This represented an all-time-high peak for the industry, the biggest previous year having been 1927 when about 16,000,000,000 passengers were carried. Some localities experienced increases far greater than the average, and some had smaller increases. Generally speaking the surface electric railways gained in about the same ratio as the transit industry as a whole, or from about 6,000,000,000 to nearly 8,000,000,000. This, however, was considerably below 1923, the peak year of street car riding, when more than 13,000,000,000 passengers were carried. Rapid transit lines and electrified suburban railroads experienced moderate increases in riding.

Reports from transit operating companies all over the United States and Canada present a statistical picture of electric transportation at the beginning of 1942 as shown in the tables on page 262.

Route and Equipment.—The general effect of war conditions was to "freeze" the status of electric transportation route mileage and equipment throughout the year 1942. A few minor route extensions were made, as well as a few minor abandonments, but the mileage involved was a negligible part of the total. Changes in the amount of equipment owned were also of small extent. In line with its policy of encouraging greater use of public transportation facilities the Office of Defense Transportation recommended the construction of 800 new street cars and 600 new trolley buses in 1942. The War Production board, however, ruled that sufficient materials were not available, and authorization was given only for the construction of 357 new street cars and 450 trolley buses. This was no more than a normal year's increase in equipment. No new rapid transit cars were built during the year, nor new equipment for electrified railroads.

Despite the relatively small increase in the number of vehicles, the transit companies operating electric transportation were able to augment their service substantially by making more intensive use of their existing equipment, and particularly by reconditioning cars that were on hand.

Exact figures were not available to show how many of the older cars were restored to service, but the number certainly was large. (J. A. Mi.)

Elias, Alois

(1890–1942), Czech general and premier of the protectorate of Bohemia-Moravia, a cabinet member in the last years of the republic, was appointed premier and interior minister of the protectorate in April 1939. His efforts to keep the Czechs in line with German regulations did not satisfy the nazis as being thorough or effective, and his duties were restricted and authority limited. Likewise, his attempts to effect a compromise on anti-Semitic legislation earned General Elias the distrust of the Germans. He met with equal disfavour among his own anti-nazi Czech people who considered him a nazi tool. When in Sept. 1941, German authorities announced a state of emergency in Bohemia-Moravia, they revealed that Elias had been arrested and sentenced to death for treason. A London dispatch of June 20 said his execution was reported in a German radio broadcast.

Elliott, John Lovejoy

(1868–1942), U.S. educator, was born Dec. 2 in Princeton, Ill. He was graduated from Cornell in 1892 and received his Ph.D. from the University of Halle, Germany, in 1894. He taught ethics in the New York Ethical Culture school after 1894 and was elected senior leader of the Ethical Culture society in 1933. He founded in 1895 the Hudson Guild in New York city, a recreation centre for thousands of young people. He devoted the major part of his career to welfare work among the poor and fought for better housing and public health facilities. Dr. Elliott was president of the National Federation of Settlements, 1919–23. He died in New York city, April 12.

Emergency Management, Office for.

On May 25, 1940, President Roosevelt, in an administrative order issued "in pursuance of Part I of Executive Order No. 8248 of September 8, 1939," found the existence of a threatened national emergency and established, in the executive office of the president, the Office for Emergency Management. Actually, the Office for Emergency Management (OEM) was created a few days earlier than the establishment of the Advisory Commission to the Council of National Defense, which was done on May 29, 1940.

On Jan. 7, 1941, the president issued Executive Order No. 8629 establishing the Office of Production Management within the Office for Emergency Management. This was a significant step, in that the Office for Emergency Management replaced the Advisory Commission to the Council of National Defense as the over-all co-ordinating defense organization. To strengthen this effort at basic co-ordination the president, on Feb. 28, 1941, reallocated to the Office for Emergency Management the funds which already had been made available to the several offices of the Advisory Commission to the Council of National Defense. These funds were used for administrative and operating expenses of the Office for Emergency Management and such agencies as were established in or co-ordinated through it. In his letter of reallocation the president authorized the liaison officer for Emergency Management to establish in the OEM a Division of Central Administrative Services and a Division of Information to provide staff services to the constituent agencies of the OEM. The Division of Information in 1942 was made a part of the Office of War Information.

At the end of 1942, the following agencies were within the framework of the Office for Emergency Management:

Office of the Liaison Officer (including Division of Central Administrative Services and Office of the Counsel): Board of War Communications (*q.v.*); National War Labor Board (*q.v.*); Office of Alien Property Custodian; Office of Civilian Defense (*q.v.*); Office of the Coordinator of Inter-American Affairs; Office of Defense Health and Welfare Services (*q.v.*); Office of Defense Transportation (*q.v.*); Office of Lend-Lease Administration (*q.v.*); Office of Scientific Research and Development (*q.v.*); Office of War Information (*q.v.*); War Manpower Commission (*q.v.*); War Production Board (*q.v.*); War Relocation Authority, and War Shipping Administration.

The Emergency Price Control Act of 1942, approved by the president on Jan. 30, 1942 (56 Stat. 29; 50 App. U.S.C. 921), created the Office of Price Administration (*q.v.*) as an independent agency under the direction of a price administrator. Until the passage of the First Supplemental National Defense Appropriation act, 1943, the Office of Price Administration was an OEM agency and received funds from the Office for Emergency Management and the Emergency Fund for the President. The Division of Central Administrative Services of the Office for Emergency Management continued to render services to the OPA, subject to the approval of the bureau of the budget, as required by the Appropriation act.

W. H. McReynolds was the first liaison officer in charge of the Office for Emergency Management. In April 1941 he was succeeded by Wayne Coy, who was liaison officer throughout 1942, in addition to being assistant director of the bureau of the budget. (W. Cy.)

Emmons, Delos Carleton (1888–), U.S. army officer, was born Jan. 17 in Huntington, W.Va. He was graduated from West Point in 1909 and was commissioned as an infantry lieutenant. In 1917, he was transferred to the aviation service of the signal corps, remaining in this branch of the service throughout World War I. In 1934, he was sent to Hawaii as commanding officer of an air unit. He was made a brigadier general in 1936, major general in 1939 and lieutenant general in 1940. He was appointed commanding general of the G.H.Q. air force in 1939. Emmons, rated as a command pilot and command observer, the two highest rankings for airmen in the U.S. army, was named chief of the air force combat command in June 1941. After the Japanese attack on Pearl Harbor, Gen. Emmons was designated Dec. 17, 1941, as head of the army command of the Hawaiian department, succeeding Lieut. Gen. Walter Short. He was given over-all command of the army and air force at Hawaii. In 1942 he warned that another Japanese attack on Hawaii could be expected but said the island would be well prepared for such an emergency.

Endocrinology. **Anterior Pituitary Gland.**—Pituitary damage generally leads to a loss in body weight, while injury to the hypothalamus results in a marked gain in weight. The work of Hetherington and Ranson further clarified the respective roles of the anterior pituitary and the hypothalamus in the control of body weight. Growth in body length is not interfered with by injury to the hypothalamus. When the anterior hypophysis is removed without injury to the hypothalamus, a decrease in weight occurs. When the removal of the anterior hypophysis is accompanied by hypothalamic damage, obesity follows but without growth in body length. These findings clearly indicate that the influence of the hypothalamus on appetite, and through it on body weight, is not mediated by the pituitary gland. They also show that, while increased nutrition must be a concomitant of normal growth in stature, the increase in weight and increase in length are actually independent processes. The anterior pituitary gland is essential to true growth, but is not essential to the formation and deposition of adipose tissue.

As regards the influence of the anterior pituitary on growth Marx, Simpson and Evans, using thyrotropic hormone, confirmed the previous work showing that the presence of increased thyroid activity or thyroid hormone enhances the effect of a given dose of growth hormone. With respect to weight increase, Marx and co-workers also reported that immature hypophysectomized rats treated with growth hormone but allowed only the same food intake as untreated hypophysectomized animals, nevertheless gained more weight. In the light of the work of Samuels and associates, the explanation for the increased weight of the treated animals would appear to be an increased retention of minerals and water.

There have been two points of view as regards the inability of the hypophysectomized animal to maintain its blood sugar level during fasting. Some workers advanced evidence that the difficulty arises from a reduced ability to make blood sugar in the liver; others have contended that there is an excessive utilization of the blood sugar. Bodo and co-workers studied this problem by comparing normal and hypophysectomized dogs as regards their reaction to adrenalin administration and to hypoglycaemia, taking into account the liver glycogen stores available at the time. Their results indicated that in the absence of the anterior hypophysis, the mechanism for the rapid conversion of liver glycogen into blood sugar is impaired.

The diabetic state induced in dogs by the repeated administration of massive doses of anterior pituitary extract was further studied. Young compared the reaction of adult dogs and of puppies to this treatment. Most of the former developed diabetes while the puppies (which have a relatively greater amount of insular tissue) did not. These results support the hypothesis that so-called Young's diabetes is due to an exhaustion of the overstimulated islands of Langerhans. Houssay and co-workers studied the rate at which overstimulation is able to exhaust the pancreas of adult dogs. The pancreatic glands of pituitary-injected animals were implanted into the neck of completely depancreatized dogs. The glands of animals which had been injected with pituitary extracts up to four days, were still capable of secreting sufficient insulin to keep the test animals at a normal blood sugar level. The pancreatic glands of animals injected for longer periods became progressively less able to furnish the required amount of insulin.

It was generally accepted that the anterior pituitary gland stimulates the thyroid by way of the thyrotropic hormone. Nevertheless, it was also known that a diminished amount of this hormone is found in the blood and urine of thyrotoxic patients while the reverse is true in hypothyroidism. The work of Rawson, Sterne and Aub helped to resolve this paradox. They found that thyrotropic hormone was inactivated by incubation with slices of thyroid tissue, there was some inactivation by lymphoid tissue but none by other tissues. It may well be, therefore, that the decreased thyrotropic hormone levels in thyrotoxicosis and the increased levels in hypothyroidism are reflections of the rate of destruction of the hormone by the thyroid gland, rather than measures of the amounts secreted by the pituitary. The manner in which thyrotropic hormone exerts its influence on the thyroid gland was studied by Morton *et al.,* making use of radioactive iodine. They found that in normal animals the radioactive iodine was rapidly incorporated into di-iodotyrosine and thyroxine. In hypophysectomized animals, on the other hand, the iodine did not progress beyond the stage of di-iodotyrosine. This would indicate that the anterior pituitary, through the thyrotropic hormone, regulates the conversion of the inactive di-iodotyrosine into the hormonally active thyroxine.

Thyroid.—One of the most important developments in the knowledge of the thyroid was the discovery that simple iodination of blood serum, or even albumen or casein, leads to the formation of organic iodine compounds with thyroid hormone activity. Such compounds were successfully used in the treatment of myxoedema and presumably the same compound was formed in the blood and in the thyroid gland when iodine was used to treat endemic goitre. This made it difficult to understand the well-known effect of iodine in lowering the metabolic rate in thyrotoxicosis. The work of Reineke, Williamson and Turner might offer an explanation. They showed that the progressive iodination of casein produced compounds with progressively greater thyroid activity until the iodine content reached 7%. As the proportion of iodine was increased beyond this figure the thyroid activity of the end product was reduced.

Work during 1942 also shed some light on the mechanisms by which the organism is harmed in thyrotoxicosis. The loss in body weight and the reduction in the liver glycogen content have been considered to be direct effects of the excess of thyroid hormone. Drill, Overman and Shaffer showed that the administration of the vitamin B complex (in the form of fresh whole yeast) together with thyroid extract prevents the weight loss and the deglycogenation of the liver which otherwise occurs. It seemed likely that when the metabolic rate is increased by the administration of thyroid extract, or spontaneously in thyrotoxicosis, the available B vitamins are used up at an excessively rapid rate. As a result of this the appetite does not keep pace with the increased nutritional requirements, and loss of weight and lowered glycogen storage levels result. In the work of Drill and associates the thyroid treated animals receiving adequate amounts of vitamin B complex increased their food intake, as compared with the control animals which received thyroid extract alone.

Parathyroid.—The work of Neufeld and Collip demonstrated that the parathyroid hormone increases the level of calcium in the blood indirectly, by increasing the rate of excretion of phosphates by the kidney. Nephrectomy, or ligation of the renal blood vessels or of the ureters in experimental animals prevented the hypercalcemia following parathormone administration. In normal animals given parathormone, the replacement of the excreted phosphate by sodium acid phosphate administration also prevented the rise in blood calcium.

There was other work which might show a closer relationship between the level of calcium in the blood and the activity of the parathyroid glands. Patt and Luckhardt perfused the parathyroids of experimental animals with blood containing little or no calcium. Their results indicated an outpouring of parathormone following this stimulus. A similar result was obtained after the blood calcium was lowered by the intravenous administration of sodium oxalate. Thus the parathyroids resemble other endocrine glands which have been shown to be partly regulated by the blood levels of the substances which they affect. However, determinations of phosphate were not recorded by Patt and Luckhardt and it was possible that their results might have been secondary to changes in the blood phosphate level.

Pancreas.—Little is known of the functional interrelationships between the endocrine glands and the central nervous system. Although nerve pathways to the endocrines have long been outlined, it is generally true that a gland can maintain fairly normal endocrine control of the bodily functions it affects even after its nervous connections have been completely interrupted. However, there was evidence that nervous stimulation and inhibition of glandular secretion do occur, and that they may be important as emergency mechanisms. It is possible that these same pathways may be involved in the glandular disturbances accompanying psychoneuroses. McQuarrie, Ziegler and Hay clarified the interplay of neuro-endocrine influences on the blood sugar level during anoxia. They found that in the intact animal, anoxia resulted in hyperglycaemia. Under the same circumstances, animals lacking the secretion of the adrenal medulla responded with a hypoglycaemia. When the pancreas as well as the adrenals were removed, anoxia had no influence on the blood sugar. In view of previous evidence that anoxia produces its effects via the nervous system, it appeared that it stimulates both the sympathetic-adrenal and the parasympathetic-pancreas systems. Ordinarily the former prevails so that hyperglycaemia usually occurs. Noxious stimuli other than anoxia also have the same effect. One might speculate that a reversal of the relative strengths of the two systems in some individuals might account for certain cases of periodic hypoglycaemia. (*See* also PHYSIOLOGY; ZOOLOGY.)

(S. So.)

Engel, Kurt (1909–1942), Austrian pianist, was born Jan. 14 in Vienna and studied at the Academy of Music and the Master-School for Piano, Vienna. In 1932, he won a prize in the international Chopin competition in Warsaw. Engel, a refugee from nazi Austria, arrived in the United States in 1938 and was soloist with leading symphony orchestras on the stage and in radio. His last public appearance was in Carnegie hall, New York city, April 1941. He died in New York city, Jan. 22, while giving a piano lesson.

England: *see* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

English Literature. The expression of the creative spirit in literature in Great Britain during 1942 was not especially remarkable. That could not be expected. War is not a healthy state either for the arts or for the body politic. It is in fact the culmination of a state of disease. Destruction is the result of a failure to create. And English literature after 1914 more often lamented that failure than redeemed it. But there were signs in the literature of 1942 that the pulse of creation was beginning to beat more strongly. A nation's poetry should be the index of its state and there was an unusual spate of verse by young poets. Two things were notable about it. Though it reflected an appalled sense of the negation of human values which modern war is and an inevitable element of creative frustration, it had cast off sophisticated disillusionment. Second, while its note was seldom combative, the best of it did grapple with the roots of evil from which the mechanical frenzy of war days springs. This applies to such anthologies of new verse as *Poems of This War,* edited by Patricia Ledward and Colin Strang, *Lyra,* edited by Alex Comfort and Robert Greacen, *Poems from the Forces,* edited by Keidrych Rhys, or *Poetry in Wartime,* edited by M. J. Tambimuttu. There were, also, individual volumes of note by Alun Lewis, Henry Treece, Ruthven Todd, Nicholas Moore and Francis Scarfe. In this new movement of poets there were signs of imagination escaped from the clutches of self-conscious intellectualism and beginning to create its own forms and language. Among the work of older poets Robert Nichols' selection from his poems of 20 years, *Such Was My Singing,* possessed a lyrical gusto, a buoyant craft, as well as a satirical and rhetorical daring hardly to be found elsewhere in these unromantic days.

In the realm of fiction there was less originality. Such established writers as Francis Brett Young, L. A. G. Strong, Victoria Sackville-West, G. B. Stern, D. L. Murray and Robert Graves all gave of their expected best. But in none of these can the possibilities of fiction be said to have been extended or essentially new ground explored.

It was, however, on the whole a fruitful year for biography, autobiography and criticism, though soundness and comprehensiveness were more characteristic than brilliance. Among notable books in this field were Garret Mattingly's *Catherine of Aragon,* Edmund Blunden's *Thomas Hardy,* Hugh Fausset's *Walt Whitman,* Forrest Wilson's life of Harriet Beecher Stowe, Ralph Straus's *Sala,* Joseph Hone's *Life of W. B. Yeats,* and Jean Burton's *Sir Richard Burton's Wife.* One of the cleverest books, compounded of biography and criticism, was William Gaunt's *The Pre-Raphaelite Tragedy.* John Pick's study of *Gerard Manley Hopkins* as priest and poet will not be easily superseded, and R. Ellis Roberts' *H. R. L. Sheppard* was a notable contemporary portrait. Perhaps the best autobiographies had a rural and naturalistic background—for example, A. L. Rowse's *A Cornish Childhood* or H. J. Massingham's *Remembrance.* But there was one religious autobiography of absorbing interest, the anonymous *Midnight Hour* by "Nicodemus."

Of pure criticism there was little, but the precise scholarship of Geoffrey Tillotson's *Essays in Criticism and Research* recalled a world in which vital conventions held chaos in check. E. M. Forster's Rede lecture on Virginia Woolf made an admirable introduction to the posthumous volume of her essays. And three outstanding works, Rae Blanchard's *Correspondence of Richard Steele,* Katharine Balderston's *Thraliana* and Ernest de Sélincourt's *Dorothy Wordsworth's Journals* testified to the patient persistence of editorial research.

Of books defying any particular category perhaps the most remarkable was Rebecca West's *Black Lamb and Grey Falcon,* a compelling meditation upon recent European events interwoven with a journey through Yugoslavia and a plunge into Balkan history.

Much print and paper, of course, went into books dealing from all angles with the war. But few, if any, of these, whether it was such a vivid and circumstantial record as Charlotte Haldane's *Russian Newsreel* or accounts by fighter pilots of their experiences, like Richard Hillary's *The Last Enemy,* were essentially distinct from journalism.

(*See* also AMERICAN LITERATURE; PUBLISHING [BOOK].)

(H. I'A. F.)

Entomology. The demands of the army and navy for specialized foods for overseas forces created needs not provided for by any existing agencies and the labour problems became continually more acute in 1942. The great value of dried and dehydrated vegetable and animal foods and the advantages of these products over fresh and even canned goods in respect to weight and bulk in shipping became so apparent and desirable that a national dehydration program was being perfected as rapidly as possible. Dehydrated vegetables usually contain 5% or less of the original moisture content and dried meats, milk and eggs may have the moisture reduced about as much. In the case of dried fruits the moisture content may remain as high as 14% to 20%. However, in all of these products both weight and bulk were reduced to the extent of requiring about 4½ times less space than the ordinary fresh materials, which was a large item in connection with vital transportation problems. This turn to dehydrated foods was further augmented by the scarcity of tin cans and metal containers previously used for the preservation of a large part of the animal, fruit and vegetable foods of the nation.

The most important dehydrated foods, other than raw and manufactured cereal products in 1942 were: ANIMAL: whole milk, eggs and meats; VEGETABLE: potatoes, cabbages, peas, spinach, carrots, turnips, onions, beans, beets, corn, rhubarb, pumpkins, and squash, sweet potatoes, tomatoes and baked beans; FRUITS: apples, apricots, raisin grapes, peaches, pears and prunes.

Entomological Problems in Connection with Dried and Dehydrated Foods.—The entomological problems in connection with the preparation and preservation of dried and dehydrated fruits are many and varied. They begin with the planting of the seed and do not cease until the food is ultimately consumed. The danger of food destruction by insects is always present. Government specifications for dehydrated foods required that they be practically free from insect damage, which necessitated a thorough program of insect control on the growing crop. This might prove to be a most difficult program due to the scarcity of a number of important insecticides, including copper compounds, mercury compounds, zinc, arsenic, rotenone, etc.

Every practice known to the entomologist, the professional agriculturist and the practical farmer which had a bearing on the reduction and control of insect pests had to be utilized in this war program of crop production. This meant that in addition to the well-known methods of spraying, dusting, and fumigation, it would be necessary to practice clean culture to reduce natural breeding places for insects; thorough cultivation to eliminate volunteer hosts; crop rotation to prevent continuous infestations of successive crops of the same kind; timely planting, cultivation and irrigation; early harvest; early fall plowing of stubble and the destruction of refuse; and many other similar performances that increase crop production and at the same time reduce insect infestations and losses occasioned by them.

Fortunately the process connected with the dehydration of all food products in which the various materials are subjected from 4 to 12 or even 24 hours to temperatures of 140° F. to 200° F. or more, renders such products absolutely free from all forms of insect life. This thorough sterilization and the great reduction of the moisture content guarantee a clean and wholesome product to the consumer, in so far as insects are concerned, if the food can be packed immediately in clean containers which, when perfectly sealed, are proof against the entrance of the minutest forms of insect life. If, however, the dehydrated products are carelessly stored in insect-infested bins or warehouses, they may soon take up moisture and become thoroughly infested and contaminated by insects.

Insects which are common on various types of stored food products are practically cosmopolitan in distribution because of commerce. They are always most abundant and injurious in the tropics, but if artificial or natural temperature and moisture conditions are favourable to their development, they may be quite as destructive in subtropical, temperate and even colder regions. It is to be expected that food supplies sent into the tropics will be subjected to very severe tests by insects and unless the packaging of the products remains always insect proof, which also means practically gas tight and moistureproof, insects are sure to make their way into the products. Packages which may meet these requirements in the U.S. may not be able to withstand the onslaughts of insects aboard ships and in the exposed food dumps of the tropics, where they will be at the mercy of sun, rain and tropical insects.

Most Important Insects and Mites Infesting Stored Products

Cereals and Cereal Products

Granary weevil, *Sitophilus granarius* (Linn.); rice weevil, *Sitophilu oryzae* (Linn.); lesser grain borer; *Rhizopertha dominica* (Fab.); cadelle *Tenebroides mauritanicus* (Linn.); drugstore beetle, *Stegobium paniceum* (Linn.); broad-nosed grain weevil, *Caulophilus latinasus* (Say); saw-toothe grain beetle, *Oryzaephilus surinamensis* (Linn.); rust-red grain beetle *Laemophloeus ferrugineus* (Stephens); flat grain beetle, *Laemophloeus pusillus* (Schön.); square-necked grain beetle, *Cathartus quadricollis* (Guérin) confused flour beetle, *Tribolium confusum* (Duval); rust-red flour beetle *Tribolium castaneum* (Herbst.); broad-horned flour beetle, *Gnathoceru cornutus* (Fab.); false black flour beetle, *Aphanotus destructor* (Uytten) long-headed flour beetle, *Latheticus oryzae* (Waterh.); yellow mealworm *Tenebrio obscurus* (Fab.); Angoumois grain moth, *Sitotroga cerealell* (Oliv.); Mediterranean flour moth, *Ephestia kuehniella* (Zeller); Indian meal moth, *Plodia interpunctella* (Hbn.); meal snout moth, *Pyralis farinali* (Linn.); cereal psocid, *Troctes divinitorius* (Müller); cereal mite, *Tyroglyphus americanus* (Banks); grain mite, *Tyroglyphus longior* (Gervais); flou mite, *Aleurobius farinae* (DeGeer).

Dried and Dehydrated Fruits

Saw-toothed grain beetle, *Oryzaephilus surinamensis* (Linn.); dried fruit beetle, *Carpophilus hemipterus* (Linn.); confused flour beetle, *Tribolium confusum* (Duval); Indian-meal moth, *Plodia interpunctella* (Hbn.); raisin moth, *Ephestia figulilella* (Greg.); fig moth, *Ephestia cautella* (Walker); dried fruit mite, *Tyroglyphus passularum* (Hering).

Seeds and Nuts (Whole and Shelled)

Bean weevil, *Acanthoscelides obtectus* (Say); pea weevil, *Laria pisorum* (Fab.); broad bean weevil, *Laria rufimanus* (Boh.); four-spotted bean weevil, *Laria 4-maculatus* (Fab.); Mexican bean weevil, *Zabrotes pectoralis* (Sharp); saw-toothed grain beetle, *Oryzaephilus surinamensis* (Linn.); red-egged ham beetle, *Necrobia rufipes* (DeGeer); Indian-meal moth, *Plodia nterpunctella* (Hbn.); chocolate moth, *Ephestia elutella* (Hbn.)

Cheeses; Cured Meats and Dehydrated Milk and Eggs

Red-legged ham beetle, *Necrobia rufipes* (DeGeer); black carpet beetle, *Anthrenus piceus* (Olivier); varied carpet beetle, *Anthrenus verbasci* (Linn.); cheese skipper, *Piophila caesi* (Linn.); cheese mite, *Tyroglyphus iro* (Linn.).

Fumigants for Stored Food Products Insects

The most important fumigants used in 1942 for treatment of insect- and mite-infested food products were:

Cereals and Cereal Products

Hydrocyanic acid (HCN).—Available as a solid, dust or liquid. A deadly gas that should be used with great care. Amount required depends upon the kind of fumigant used.

Methyl bromide (bromomethane—CH_3Br).—Liquid used at the rate of 1 lb. to 1,000 cu. ft. of space.

Methyl formate ($C_2H_4O_2$) is a relatively new and effective material when used alone or in combination with carbon dioxide.

Chloropicrin ("vomiting gas"—$C\ Cl_3NO_2$).—A liquid often applied as a spray used at the rate of 2 lbs. to 1,000 cu. ft. of space.

Carbon disulphide (CS_2).—A liquid often applied as a spray. Highly explosive and should be used only by experienced persons. Should not be used in insured buildings without the written consent of the insurance underwriters. Applied at the rate of 10 to 30 lbs. per 1,000 cu. ft. Fire hazard is reduced by mixing with carbon tetrachloride.

Carbon tetrachloride ($C\ Cl_4$).—A relatively noninflammable fluid and gas commonly known as a "cleaning fluid." Applied at the rate of 30 lb. per 1,000 cu. ft. Often mixed with carbon disulphide, chloropicrin, ethylene dichloride and other gases to reduce their fire hazard.

Ethylene dichloride ($C_2\ H_4\ Cl_2$).—A heavy and not dangerously inflammable gas. Often combined with carbon tetrachloride in proportion of 3 to 1. Used alone at rate of 15 lb. or 3 to 6 gal. per 1,000 cu. ft. or in combination with carbon tetrachloride, as indicated above, at the rate of 3 gal. per 1,000 cu. ft. of space.

Dried Fruits

Methyl bromide.—See above.

Chloropicrin.—See above.

Carbon disulphide.—See above.

Carbon tetrachloride.—See above.

Ethylene dichloride.—See above.

Ethylene oxide [$(CH_2)_2O$]. Noninflammable when used at the rate of 2 lbs. per 1,000 cu. ft. Also used in combination with carbon dioxide.

Ethyl formate ($C_3\ H_6\ O_2$) is now quite extensively used in individual packages of dried fruits. Before sealing the packages a small quantity of the material is added as a safeguard against possible insect infestation.

Animal Products—Cheese, Milk, Eggs, Meat

Certain chemicals that are readily absorbed or adsorbed by oils and fats are unsuitable as fumigants for animal products, which accounts for the omission of many of the above-mentioned chemicals in this list.

Hydrocyanic acid.—See above. Thorough ventilation following treatment is necessary for this gas and for chloropicrin.

Chloropicrin.—See above. Treated animal products must be thoroughly aired after treatment and before used for food.

"Carboxide," a commercial fumigant composed of a mixture of ethylene oxide and carbon dioxide in the ratio of 1 to 9. It is a very safe fumigant for animal products but is not so toxic as either hydrocyanic acid gas or chloropicrin.

Insecticides.—Among the new and promising insecticides in 1942 were: basic copper arsenate for leaf-eating cotton insects; barium arsenate for controlling blowflies on sheep in Australia; phthalonitrile for leaf- and fruit-eating insects; thiourea and derivatives proved to be toxic to the larvae of fleshflies and to the larvae of the clothes moth; xanthone gave some promise in controlling codlin moth on apples; potassium antimonyl citrate might prove to be a valuable substitute for tartar emetic in the control of citrus thrips; phenothiazine proved toxic to the larvae of the blowfly in Australia and the codlin moth larvae in the United States; calcium chloroacetate proved somewhat less effective than sodium arsenite in grasshopper baits in South Africa and effective against maggots of the blowfly in Australia; selenium compounds continued to be very toxic to orchard mites, *Tetranychus* and *Paratetranychus*, on grapes, citrus, cotton, etc., in the United States; paris green proved to be a valuable larvicide for anopheline mosquitoes, as effective as pyrethrum and petroleum oil emulsions; dinitro-ortho-cyclohexylphenol and dinitro-ortho-cresol very effective as aphide ovicides on dormant trees; nicotine, pyrethrum and rotenone compounds still held very important places in the control of many insects infesting plants that cannot be treated with heavy metal poisons. Derris or nicotine dusts were suggested as possible combinations with calcium arsenite dusts to kill both the cotton boll weevil and the cotton aphis with single applications. Acrytonitrile and chloracetonitrile were shown by H. H. Richardson and A. H. Casanges to be promising new fumigants for the control of the confused flour beetle and the bedbug. Arsenate of lead was still considered to be the most effective stomach poison for the control of codlin moth, especially for the calyx and first cover sprays. Substitutes may be made for the later applications.

A new cockroach poison, 4, 6-dinitro-o-cresol, was reported by J. B. Gahan to be more toxic to cockroaches and to kill them more rapidly than either sodium fluoride or pyrethrum, "being more effective at a 5% concentration than pyrethrum at 5% or sodium fluoride at 50%. Exposure to the air in a room for seven days did not destroy the toxicity of a 10% dust."

Control of the pillbug, *Armadillidum vulgare* (Latr.), and the dooryard sowbug, *Porcellio laevis* (Koch), in the field by the use of calcium arsenate at the rate of 3 to 5 lb. of dust to 1,000 sq. ft., was demonstrated by R. M. Bohart and A. Mallis at Los Angeles, Calif.

The control of the corn earworm, *Heliothis armigera* (Hbn.), by the use of a pyrethrum-oil mixture proved to be most successful during the summers of 1941 and 1942. From 0.75 to 1.00 cc. of the insecticide is injected into the silk end of each ear.

Scarcity of Important Insecticides.—Because of war needs, many important insecticides were allocated for other purposes based on end use. Some of these were expected to be very scarce in 1943 while others might be made available in sufficient quantities to take care of the necessary emergencies in field insect pest control. Those most affected were antimony, arsenic, copper, mercury and zinc compounds; rotenone, pyrethrum and tar oils. Fortunately considerable quantities of certain of these prepared remedies were still in the hands of insecticide manufacturers and would be available as long as the supplies held out.

Entomological Notes.—The citrus mealybug, *Pseudococcus citri* (Risso), was reported to have been extremely abundant in and injurious to the vineyards of Almeria, Spain in 1941 and 1942.

The weevil, *Otiorrhynchus singularis* (Linn.), appeared as an economic pest of Portugal laurel trees for the first time in British Columbia in 1937 and was reported in 1942.

A stem-infesting cynipid gallfly, *Plagiotrochus suberi* (Weld), was proving to be a pest of cork oaks in middle and southern California. The insect was believed to have been imported years ago from southern Europe.

The raspberry root-borer, *Pennisetia marginata* (Harris), appeared for the first time in Saskatchewan in 1941.

The tick, *Ixodes dentatus* (Maix), known previously only from the North Atlantic coast, was taken on a cottontail rabbit, near Ames, Iowa, on June 17, 1942, by C. R. Joyce and G. W. Eddy.

Because of the mild and humid winters in the south, the storage of corn and other grains is generally hazardous because of the great havoc wrought by cereal-infesting insects. Special efforts were being made to protect such food products from these pests by building cribs sufficiently tight by the use of asphalt paper liners, either to prevent infestation or to make it possible to fumigate with any of the fumigants recommended above. Carbon disulphide, a well known and reliable fumigant, has great fire hazards and should be used only in small isolated cribs and great care should be exercised to keep sparks, coals, lighted tobacco or flames from igniting and exploding it.

Increasing the populations of the cotton aphide, *Aphis gossypii* (Glover), by the application of calcium arsenate dusts for the control of the cotton boll weevil, *Anthonomus grandis*, was thought to be caused by raising the pH in the soil and thereby also in the leaf cell sap of the plants, a condition which makes the juices more attractive to the aphides and hastens their propagation and development.

The milky disease, caused by the bacteria *Bacillus popilliae* and *B. lentimorbus*, which attack the Japanese beetle, *Popillia japonica* (Newman), was extensively cultivated and distributed by entomologists of various states and of the U.S. bureau of entomology and plant quarantine. A co-operative project representing seven states, 260 experimental plots, 21,000 acres infested by the beetle, were treated with 25,593 colonies of the bacteria during the years 1939–1941 inclusive.

U.S. Public Health Service.—Many professional entomologists were employed by the U.S. public health service in connection with the control of insects and insect-borne diseases which might interfere with the military training and fighting forces in the United States and abroad. Most of these men were serving in the reserve.

A great many entomologists also enlisted in the medical departments of the army and navy and were actively engaged in malarial and other insect-borne disease control, and various sanitary problems related to it.

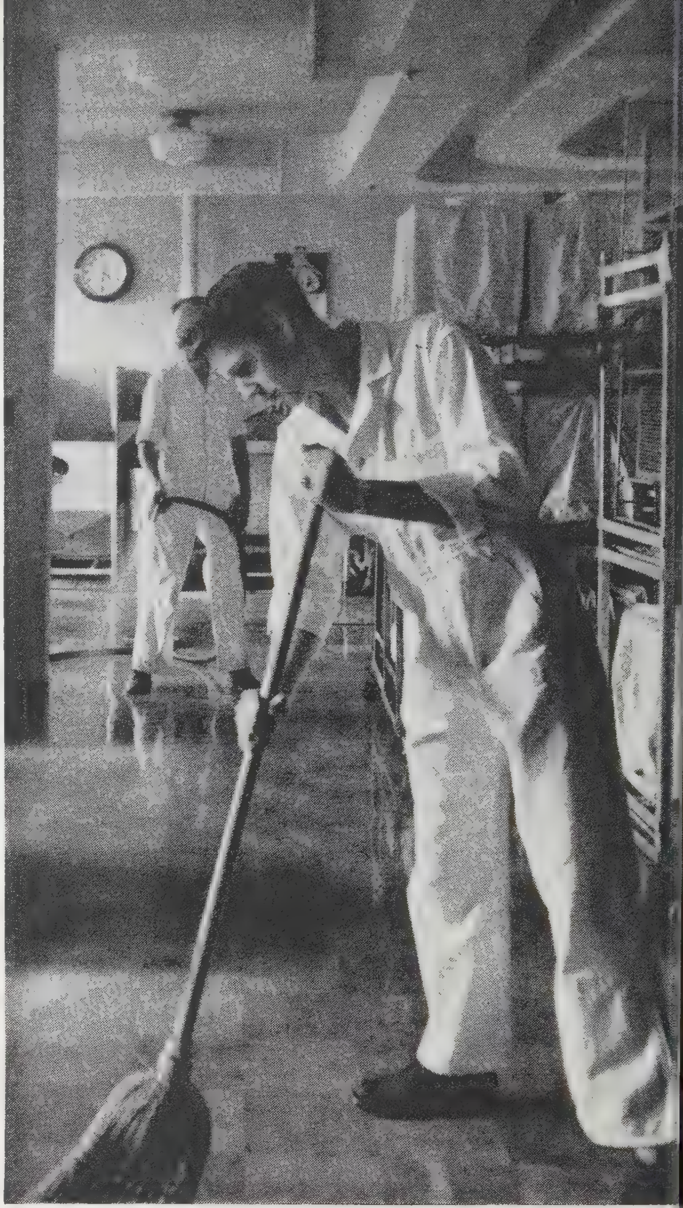
Epidemics and Public Health Control.

Paul and Trask pointed out interesting new epidemiologic facts about infantile paralysis, among which is the isolation of the virus from flies. This was done on two separate occasions, in epidemics in Connecticut and Alabama. In both instances, contaminated flies were caught within areas where the prevalence of poliomyelitis was high, and where human carriers were known to exist. The flies had been feeding, both in and outside of privies, on human stools which might well have contained the virus. Flies, as carriers of the virus, might explain much concerning the baffling epidemiology of this disease. There was much evidence that pointed to the intestinal spread of infantile paralysis. The question as to the significance of insect vectors, and also the existence during epidemics of other possible extrahuman carriers of the virus, such as mammals and birds, would require further study.

Diphtheria.—Bundesen pointed out in 1939 that the level of antitoxin developed in the blood stream following inoculation with diphtheria toxoid decreased in amount as time went on.

Volk and Bunney stated that diphtheria antitoxin immunity, regardless of the immunizing procedure, is not permanent, and that as time goes on the antitoxin content of the blood stream is reduced. This fact had been confirmed by other workers.

Volk and Bunney claimed that reinoculation of children five or six years after inoculation in infancy would maintain the blood antitoxin at a good average level. However, diphtheria experience in Chicago showed that many children who had toxoid developed diphtheria less than three to five years after inoculation with toxoid. Consequently, Bundesen felt that the best practical solution to diphtheria prevention is to inoculate infants at ni months of age, giving a reinforcing dose at about three years age, and another reinforcing dose when the child enters kinde garten or first grade.



CLEANSING THE INFECTED TICK-REARING ROOM at the Hamilton, Mon laboratory for study of Rocky Mountain spotted fever. More than 200,000 pe sons were vaccinated against this fatal disease in 1942, yet it continued spread over the United States

Pneumonitis.—A widespread outbreak of virus pneumonia, pneumonitis, occurred during 1942 in many parts of the Unit States. The sputum in these cases does not type out for pneum coccus. Cases were seen of all types of severity. Few deat were reported. Some of the common symptoms are: headach cough, muscle pains, pain in the chest, increased temperature usually very slight. The disease is peculiar in that many cas have lasted two, three, four or five weeks. Apparently, the d ease is due to a virus which is not affected by sulphonamide dru Diathermy is said to produce favourable results, although the is not enough experimental evidence to support this belief. Trea ment consists mainly of constitutional measures.

Whooping-Cough.—In 1942, in Chicago, about 150 cases whooping-cough were treated with a high antibody titre rab serum. The serum was prepared from rabbits which received peated inoculations of vaccine. A large percentage of patie showed definite and prompt improvement, indicating that t serum if given early in the disease will act more or less as specific. Reactions were so mild that they were not considerec drawback to the administration of the serum. (*See* also BACTERIOLOGY; ENTOMOLOGY.) (H. BU.)

Epstein, Abraham (1892–1942), U.S. economist and authority on social security, was born April 20 in Russia. He immigrated to the United States in his youth and was educated at the University of Pittsburgh, graduating in 1917. He then joined the Pennsylvania commission on old age pensions as research director and drafted the first model old age pension bill which was introduced to the state legislature in 1921. An advocate of old age pensions and unemployment and health insurance, he was credited with helping build up public opinion that made the federal social security bill possible. Epstein, who was a lecturer on social insurance at New York university and at Brooklyn college, died in New York city, May 2.

Eritrea: *see* ITALIAN COLONIAL EMPIRE.

Esperey, Franchet d' (1856–1942), French army officer, was born May 25 in Mostaganem, Algeria, where his father was on duty as a colonel. Young d'Espérey entered St. Cyr when he was 18. Seven years later, he was commissioned as a lieutenant and soon saw action in desert campaigns in Algeria and Tunisia. In 1882, he fought against the Indo-Chinese at the siege of Tonkin, and after 20 years in the orient he returned to France to command a regiment in Besançon. At the start of World War I, he was in command of the first army corps and distinguished himself in battles against the advancing Germans in early 1914. He was later transferred to command of the 5th army corps and succeeded in repulsing Von Bulow's armies in the first battle of the Marne. In 1917 he replaced Foch as commander of the armies of the north, but the next year was chosen to command the Army of the Orient when the Allies decided to break the grip of the Central Powers in the near east. On Sept. 10, 1918, he launched an offensive in Salonika that crushed the resistance of the Bulgarian-German armies in 10 days. Bulgaria was knocked out of the war by the end of the month and Turkey capitulated shortly afterward. He was made a marshal of France in 1921 and was elected to the French Academy to succeed the late Marshal Lyautey in 1934. Marshal d'Espérey left Brittany as the Germans advanced southward in June 1940 and moved to his estate near Albi, France, where he died July 8, 1942.

Espionage: *see* FEDERAL BUREAU OF INVESTIGATION.

Estaunié, Edouard (1862–1942), French novelist, was born Feb. 4 in Dijon and studied at the École Polytechnique. A retired official of the French post office, Estaunié wrote novels in his leisure and was elected to the French academy in 1924. In later years he wrote *Le labyrinthe, Tels qu'ils furent* and *Madame Clapain* (1932). He died April 2, according to a Vichy dispatch. (See *Encyclopædia Britannica.*)

Estonia. One of the Baltic states of northeastern Europe, north of Latvia, south of Finland, formerly a republic; became part of Germany's "Ostland" (*q.v.*) in 1941. Area 18,371 sq.mi.; pop. (est. 1939) 1,122,000. Chief towns: Tallinn (capital 146,400); Tartu (60,100); Narva (24,200); Nomme (19,700); Pärnu (21,500). Language, Estonian (a Finno-Ugrian tongue). Religion, Christian (Lutheran 78%, Greek Orthodox 19%). Ruler in 1942: the German reich through Reichscommissar H. Lohse of the Ostland and Commissioner-General Litzmann for Estonia.

History.—Behind affairs of 1942 in Estonia and the other Baltic states stood the sequence of events after Sept. 29, 1939 when Estonia signed her "treaty of mutual assistance" with the U.S.S.R. and granted garrison privileges to the Red army. Immediately after June 15, 1940, the Russians definitely occupied the country, perhaps forestalling a German *Putsch.* On July 15 Estonia "voted" to apply for membership in the U.S.S.R. and in August was accepted as the 16th soviet republic. Until the summer of 1941, Estonia remained under soviet domination. Collectivization was not completed in this one year of control, but the status of some of the larger farms and factories was changed and the economy of Estonia was being reoriented.

When the Germans struck against the U.S.S.R. on June 22 1941, Estonia's geographic position delayed the struggle there for a short time. Russian garrisons held out in the islands of Hiiumaa (Dagö) and Saare Maa (Oesel) until the very end of 1941, but the Germans then completed their conquest. The new nazi civil administration was set up on Dec. 5, 1941, the last one in the Baltic states. The five-man council of Estonian "fuehrers" was subordinated to the local Commissioner-General Litzmann and to Reichscommissar Heinrich Lohse with headquarters in Riga.

Reconstruction aims were defined by the nazis as "replacing chaos by European order, and substituting construction and civilization for destruction." In detail this meant taking ownership of the sovietized lands and industries by the German state and collecting rents from former owners. Estonia was also one of the countries for which Danish and Dutch economic co-operation was sought by the nazi administrators—seemingly with little success. The "new order" was also announced to involve educational reform, with the re-establishment of the famous old university at Dorpat (Tartu) (founded by Gustavus Adolphus in 1632 during Swedish control of the region); another phase of this reform would make German the universal language of the country. Plans were also made for the rebuilding of the destroyed sections of Tallinn (Reval), where fortunately the picturesque old central portion had survived intact. Seemingly the German "Balts" who had been moved out of Estonia in the fall of 1939 were not being sent back to the country unless in small numbers. The threat of eviction of native Estonians still stood, however, and it was feared that the Germans intended to use the land as rewards for meritorious nazis when the war was over, and to resettle the Estonians farther to the east.

Abroad the Estonians were less active than the nationals of the neighbour states, and news from this little country was exceedingly scarce. The essential fact was that most things both present and future depended on the outcome of the military struggle raging just east of the border—and on battlefronts around the world.

Statistics of education, finance and economic conditions ceased to be issued after the soviet occupation in 1940; the following figures apply to the years preceding World War II.

Education.—In 1937–38 there were 1,224 elementary schools 58 middle schools, 39 technical schools and 30 agricultural schools Tartu (Dorpat) university had 3,219 students and 217 professors in 1938.

Finance.—The monetary unit is the kroon (26.7 U.S. cents at par). Effects of German monetary changes in 1941 and 1942 were uncertain. Revenue (est. 1939–40) 99,293,000 kroons; expenditure 99,293,000 kroons.

Trade and Communication.—Imports in 1939 totalled 101,351,000 kroons; exports, 118,217,000 kroons. Principal imports were raw cotton, sugar, woollen yarns and thread, iron and steel. Principal exports were butter, wood and paper, cotton goods, cellulose, flax and tow, meat products and eggs. Imports were chiefly from Germany, Great Britain, Sweden, the United States and the U.S.S.R. Exports were chiefly to Great Britain, Germany, Finland, the United States and Sweden. In 1942 what trade existed was confined largely to Germany and her satellites, even Sweden being largely cut off.

Agriculture.—Production (in short tons) of the leading crops in 1939 was as follows: rye (250,994), potatoes (963,741), oats (164,684), barley (99,207) and wheat (94,026). Estonia in 1938 had 660,890 cattle, 649,730 sheep, 384,580 pigs, 219,020 horses and 1,596,570 chickens.

Manufacturing and Mineral Production. — Manufacturing production was valued at 166,238,000 kroons in 1937. One of the larger cotton mills in Europe is at Narva, where textile manufactures in 1937 were valued at 47,425,000 kroons. Other important industries are paper and wood, food products, cement, flax, leather. Shale oil production rose rapidly to 209,437 short tons in 1939. Approximately 60,000 people were employed in industry in 1938. (F. D. S.)

Etching.

In London the Royal academy and the Royal Society of Painter-Etchers conducted their exhibitions as usual, though necessarily somewhat limited in scope. In spite of the fact that almost every able-bodied Englishman was taking part in the war effort in some capacity, the response to exhibitions was surprisingly large and a number of artists even published new plates.

Of the famous Scottish trio of Sir D. Y. Cameron, Sir Muirhead Bone, and James McBey, the first-named ceased to etch, Bone was serving as an official war artist, as he did in World War I, and McBey transferred his citizenship to the United States. The distinguished English etcher, Gerald Brockhurst, was also in the U.S.

In both occupied and unoccupied France it may be presumed that such etchers as survived the fall of their country and were able to maintain themselves, were doing what they could to carry on their art.

Both the South and Central American countries and Mexico produced interesting and vital prints, but etching found comparatively little support among their artists. Woodcut and lithography seemed to be the favourite media.

Canada and Australia graphic artists succeeded in organizing exhibitions during 1942. It is particularly significant that in Honolulu both output and interest were active.

So much happened in the art life of the United States in 1942, and so many new printmakers came into public notice that a list of even the etchers who were active would be too long for inclusion here. Despite the great numbers who entered the armed forces or went into war industries, the regular annual etching shows drew entry lists equal to and, in some cases, greater than, those of normal times. The big national print societies such as the Society of American Etchers, the Chicago Society of Etchers, and the Print Makers Society of California, held their exhibitions as usual, and many other smaller and more regional groups all over the U.S. were equally active. In the east, the National Academy of Design and the Pennsylvania Academy of the Fine Arts had their accustomed comprehensive and representative print sections, while most of the other great museums throughout the land conducted print exhibitions at some time during the year. Travelling print shows were in great demand, and at on time the American National Committee of Engraving had 17 c these in circulation. Probably the most impressive demonstratio of printmaking on the part of American graphic artists, howeve took place when, on Dec. 7, the first anniversary of Pearl Harbo the Metropolitan Museum of Art, in New York city, opened i doors on a great contemporary exhibition of painting, sculptu and prints, organized by and held under the auspices of Artis for Victory, a national association designed to put at the di posal of the government the services of the artists of the Unite States. To this exhibition 724 artists from 39 states (includi the District of Columbia and Hawaii) sent 3,035 prints, fro which 578 works by 414 artists were selected by a jury nation in scope. (J. T. Ar.)

Ethical Culture Movement.

A movement in religi started in 1876 by Fel Adler in New York city, and established ten years later in Londo by Stanton Coit. Societies were active in 1942 in New York cit Brooklyn, Philadelphia, St. Louis and Chicago, and there we four in London, England. The purpose of this innovation was provide spiritual homes for people of different religious antec dents to whom the profession of traditional creeds was incompat ble with intellectual honesty, and to act as a liberalizing influen on other religious bodies by inducing them to accord greater me tal liberty to their adherents, and to place the development ethical knowledge and practice above the study of theologic tenets. The principle most emphasized was that of "the ind pendence of ethics," which was cardinal in the Platonic and Ari totelian traditions, but had been lost to view during much of t Christian period, although great theologians had at times rea serted it.

The Ethical Culture societies conduct Sunday services and large variety of educational and social welfare activities. T first social settlement in the United States (the University Sett ment in New York city) was an enterprise of the moveme which also originated, in New York and Chicago, the Visiti Nurse associations and the societies providing legal aid for t poor. A considerable literature devoted to vindicating the spir ual nature and dignity of man against the doctrine of hum animality has been produced. The movement is experimental a pragmatic in action, though the founder and the majority of t leaders offered reasoned rejections of the pragmatist doctrine metaphysics. Enterprises of the societies in England and Ameri included sustained efforts for the relief of refugees from Eu pean persecution, and their re-education and integration in English-speaking society. The formerly flourishing branches the movement in Germany and Austria were suppressed by t nazis.

The Standard, edited by George E. O'Dell, is published ea month at 2 W. 64th st., New York city. An authoritative expo tion of the movement's principles is to be found in two volum by Felix Adler, *An Ethical Philosophy of Life* and *The Reco struction of the Spiritual Ideal*. The English Ethical union (pre dent, Lord Snell) had offices in 1942 at Chandos House, Palm Street, London, S.W.1. (Ho. J. B.)

Ethiopia.

A kingdom of northeast Africa. Area, *c.* 350,0 sq.mi.; pop. (est. Dec. 31, 1939) 9,500,000; ca Addis Ababa; religions: Christian (Copt) and Mohammedan; la guages: Amharic and Arabic; ruler: Emperor Haile Selassie.

History.—The reconstruction of Ethiopia after the dama caused by the Italian occupation and the war was the empero main task in 1942. The people in the main proved loyal, a revenue came up to expectations, amounting to £500,000 in t first year. The emperor intended to restore the 1931 constitution, but was not able to summon the legislature immediately. In the meantime the government issued decrees having the force of law. The Italian decrees abolishing slavery and forced labour were kept in being.

An agreement between Great Britain and Ethiopia was signed at Addis Ababa on Jan. 31, 1942. By it, Great Britain recognized the independence of Ethiopia and the sovereignty of the emperor. Normal diplomatic relations were restored; ministers were exchanged during the course of the year. The British government undertook to help the emperor to obtain British advisers, police officers, and judges. Great Britain was to make Ethiopia grants of £1,500,000 and £1,000,000 respectively during the two years' currency of the agreement, and £500,000 and £250,000 in the next two years if it were prolonged. The British foreign secretary said in parliament that this tapering off of financial aid was to ensure that the dependence of Ethiopia on a foreign country not be perpetuated. It was agreed that Great Britain should be consulted on all currency matters. Certain areas of strategic importance were to remain under British military control so long as might be necessary for the conduct of the war against the common enemy. Apart from this, British forces would not be maintained in the country; their withdrawal was in fact complete by the beginning of Sept. 1942. Under a military convention signed at the same time as the agreement, a British military mission was provided to train and organize the Ethiopian army.

President Roosevelt announced on Oct. 9 that he had received a telegram from the emperor stating that his government and people were anxious to assume the obligations of the pact of the United Nations, and offering to place the military and economic resources of the nation at their disposal. The president accepted this offer with gratitude, and the British government did likewise. (M. Cs.)

Trade and Communication.—Chief exports: hides and skins, coffee (13,000 metric tons in 1937–38) and gold. Roads (1940) *c.* 4340 mi.; railways (Addis Ababa to Jibuti in French Somaliland) 486 mi.

European War: *see* World War II.

Events of the Year: *see* Calendar of Events, 1942, pages 1–16.

Exchange Control and Exchange Rates.

Only a small portion of international trade had any counterpart in 1942 in the foreign exchange markets. Foreign commerce was almost completely restricted to exchange among allies in the war; and within this sphere transactions were effected by governments at predetermined rates without recourse to the ordinary mechanism of payments. Consequently the outstanding features of the foreign exchange market in 1942 were its small turnover and the relative inflexibility of exchange rates. Both features were set in clear relief by the fact that even in Switzerland, a neutral country and an established centre of international finance, only three currencies—Argentine pesos, Portuguese escudos and Swedish crowns, could be freely exchanged. Those changes which did occur during 1942 in foreign exchange rates fell principally into two categories. A number of small countries, mostly neutral nations, appreciated their monetary standards in terms of foreign currencies, often as an attempt—probably futile—to combat inflation. The spread of the yen area, another main feature of 1942, frequently involved sharp alterations in exchange rates. On the whole, 1942 represented the final step in the subordination of foreign trade and finance to political and military control.

Continental Europe.—Seventeen out of 20 countries in continental Europe were linked to the central clearing of Berlin, the remaining three being Portugal, Spain and Turkey. Most of the countries which resisted but were finally conquered by Germany were permitted to trade only via the Berlin *Verrechnungskasse*, while Denmark continued in 1942 to negotiate separate payment agreements. Thus Denmark concluded bilateral agreements with Belgium (Feb. 18), Spain (Aug. 22) and the Netherlands (Sept. 9), and a triangular clearing with Sweden and Finland (April 20). Toward the end of January the Danish authorities protested to Berlin against the doubling of the German clearing debt (an increase of 460,000,000 krone) in 1941, and secured an 8% appreciation of the krone relatively to the reichsmark. The measure was opposed by the Danish Farmers' party, but supported by a union of industrialists and labourers who demanded a cheapening of imported raw materials.

During 1942 Germany virtually completed the process of bringing the valuation of the reichsmark in terms of the currencies of conquered or dominated countries to parity with such "free currencies" as the Swiss franc, dollar, etc. In some cases this was accomplished by increasing the quotation for the reichsmark in the particular country, in some cases by decreasing the premium for the free currency, and sometimes by a combination of both. Thus in April 1941 the Swiss franc bore premiums from 18%–22% relatively to the reichsmark in Bulgaria, Greece, Hungary, Rumania and Yugoslavia, whereas by April 1942 the premium had been eliminated in all but Rumania. The currency of the Netherlands was reduced to complete dependence on the German mark by admitting German exchange balances to the required cover for Dutch banknotes.

The perennial tendency for Germany to run into debt upon clearing account was intensified during the year. By April the newly founded Serbian national bank held a frozen Berlin balance of 70,000,000 reichsmarks; by the midyear Germany owed Hungary 376,500,000 pengo; the Danish case has been noted. Some countries, such as France and Italy, however, found themselves in arrears. The French government levied a 9% tax on exports, but was compelled to reduce it to 3%. In the case of Italy, the passive balance was to be partly offset by Germany's crediting the clearing account with about 1,000,000 lire daily for the labour of Italians in Germany.

Among neutral European countries, Sweden renewed clearing and payment agreements for 1942: with Germany (Dec. 20, 1941), the Swedish Export Credit board underwriting export credits to Germany; with Bohemia-Moravia (May 4, 1942); and with Hungary (Sept. 1). Trade with France proceeded on a barter basis, under an agreement effective on June 1, at about one-sixth its former volume. The clearing with Italy operated smoothly, but Germany accumulated large arrears. On April 20 the exchange control law of 1939 was renewed for another year.

Switzerland resisted the temptation afforded by New York premiums on francs (24%–55% in May) to raise the officially pegged rate, preferring to combat rising domestic prices by taxing exports (10% in the case of Spain) and applying the proceeds to an import subsidy. The authorities also refused to buy dollars at these favourable rates, since physical imports were already narrowly restricted by the European blockade and the use of dollars was limited by the United States general freezing order. In August an export embargo was placed on gold; the conversion of foreign currencies to gold reduced the Swiss holdings of the former from a high of Swiss fr. 1,308,000,000 in 1941 to Swiss fr. 143,000,000 at the end of June.

The Bank of Portugal decided in June to reintroduce the effective circulation of gold in the form of a new coin, the dubrao, equalling 1,000 escudos. Reflecting the improvement of its exchange position, Spain suppressed from August onward the "free peseta" rate prevailing outside the clearing; in the sterling relation this signified an appreciation from 46.55 pesetas = 1 pound to 40.50 = 1 pound. On Aug. 5, the *Official Bulletin* announced that from Jan. 1943 the general moratorium established in the civil war would be lifted. In Tangiers, effectively under Spanish domination until recently, the peseta commanded a premium relatively to the French franc, and the absence of exchange control conduced to chaotic monetary conditions. Turkey likewise exploited an appreciation of its standard: on Aug. 5, the import premiums paid for "free currencies" (25% for United States dollars, 40% for Swiss fr. and 40% for Swedish kr.) were reduced, but the export premia (38%, 48% and 48%) were retained at former levels to combat rising domestic prices and to counterbalance the extensive foreign claims against Turkey. A general export-licensing system was adopted on May 16. The rise of nonbelligerent countries' currencies is illustrated also by Iran, where importers paid 174 rials for the pound in 1941, though the official rate stood at 68.8 rials; in March 1942, in consequence of United Nations' demands upon the Iranian transportation system, the official rate could be adapted to the actual market level at 128–140 rials = 1 pound.

British Empire.—The exchange control system of the United Kingdom had by the beginning of 1942 been practically completed. With outside free currency countries—Switzerland and the United States—Britain employs registered accounts; with most other countries outside the sterling area, special accounts; within the area, sterling exchange for residents and sterling area accounts for nonresidents; and lastly, Central American accounts. All of these accounts are strictly bilateral except for the last category, which is fungible as amongst the various countries of Central America. Outside the large operations of the British ministries of supply and food and of lend-lease, a large share of British trade is conducted by the U.K. Commercial corporation through its subsidiaries in Spain, Portugal, Turkey, Palestine, Egypt, Sudan, Iran, Iceland, Syria and Iraq. It employs various methods of finance including the clearings and special accounts. In September the exchange control was tightened by the inclusion of Brazilian milreis and Uruguayan pesos amongst currencies to be offered by British residents to the Bank of England. With the improvement in quotations on these currencies, some British exporters had taken payment for exports in deposits in these countries and not in English banks.

During 1941 the sterling area was widened to include several near east and African currencies; but the Japanese conquests in the orient in 1942 produced a significant shrinking as we presently observe. Late in the year paper money with the imprint "Issued by the British Military Authority" was introduced in North Africa for the use of troops, since the use of ordinary English notes would have jeopardized the British exchange control system by opening a channel for the infiltration of English money seized by the Germans in the invasion of the Low Countries. For the use of American soldiers in Great Britain, special sterling accounts without restriction as to employment were introduced.

Accompanying the Japanese advance into Burma there developed in India a speculative boom in the price of silver. In March quotations advanced to Rs. 89 per 100 fine tolas and approached the point at which it would pay (at Rs. 109) to melt silver rupees. The Indian government, however, possessed ample reserves in London to assure the maintenance of its selling price of silver bullion at 23½*d.*, and the rupee rate was unaffected.

Throughout 1942 the official and free exchange rates of sterling in New York continued at $4.035.

Canada does not belong to the sterling area but maintains its rate at something of a compromise between the pound and dollar. During 1942 the Canadian dollar varied generally between 87 cents and 90 cents in U.S. dollars. On Jan. 2 two orders in cou cil became effective, considerably liberalizing the exchange co trol so far as concerns relations with U.S. and the sterling are For sums under $100 Canadian residents are not required to ma formal application in order to remit to nonresidents for goo already imported. Licences and permits are simplified or elim nated for remittances within the sterling area, and sterling a counts and money may be freely disposed of. For the fiscal ye from April 4, 1942, Canada made a "gift" of $1,000,000,0 covering anticipated exports to U.K. during the year, thus eli nating all possible foreign exchange complications.

United States.—Exchange control in the United States w already nearly full-fledged before the war declarations. On Ju 14, 1941, all continental European assets within the United Stat not already blocked were frozen, and on July 25 the assets Japan and China were included. An executive order of Dec. imposed an automatic blocking upon the assets of any count falling under the control of enemies of the United States. T last vestige of the international character of the dollar disa peared. By March 1942 the total of foreign exchanges no long quoted in New York had risen to 38, leaving only the Sou American and six sterling currencies, of which the majority we pegged.

On March 13 the treasury prohibited, except with special pe mission, the importation of foreign and domestic money fro blocked countries not under general licence and from enemy a certain other countries. As a result dollar notes fell to varyi discounts abroad, exemplified by a 50% discount in Switzerla in May. The prohibition of export of U.S. currency to Mexi was added on Aug. 14.

During the course of the year 1942 a number of Latin Ame can countries prohibited or restricted the export of U.S. curren —Argentina, Bolivia, Costa Rica, Cuba, Dominican Republic, Salvador, Honduras, Mexico, Nicaragua, Peru, Uruguay and Ven zuela. This action followed declarations of war in some cases a in others it probably represented collaboration with the U treasury. A treasury order of July 7 required the exchange of U currency in Hawaii for a special Hawaiian series by July 15. D tinctively marked notes, to prevent reimportation into the Unit States, were issued for military use in North Africa at the ra of $1 = 1 pound = 300 N.A. francs. Australia permitted the fr circulation of U.S. money.

In May the treasury put an embargo upon silver exports Portugal, Spain, Switzerland and Sweden, and in September a nounced that its stock of nonmonetary silver would be lent domestic industries. The treasury's silver buying price was a vanced from 35 cents to 45 cents an ounce on Aug. 31, probab as a part reimbursement to Mexico for undertaking compensati for U.S. oil properties.

The Board of Economic Warfare revoked general export cences after Jan. 19, 1942, in favour of individual licences fo long list of commodities. On April 30 a maximum export pri regulation became effective as formulated by the Office of Pri Administration, collaborating with the Board of Economic Wa fare and the department of state. The order provided that exp prices should be cost of acquisition plus average export-trade pr mium prevailing from July 1–Dec. 1, 1940, or from March April 15, 1942, whichever period yielded the lower premium. T regulation was subsequently revised.

Latin America.—On March 7 the Argentine minister of finan announced that, to cope with the extraordinary growth of Arge tine blocked sterling accounts resulting from abnormal exports Great Britain, an agreement had been reached to invest the exce sterling in repatriating Argentine bonds held in Great Brita chiefly the Conversion Bond issue of 1934, the "Créditos" a

Latin American Exchange Rates[1]

Averages are actual selling rates for sight drafts on New York, in units of foreign currency per dollar, with the following exception: Cuba—United States dollars to the peso. The peso of the Dominican Republic, the Guatemalan quetzal and the Panaman balboa are linked to the dollar at 1 to 1; the Haitian gourde is fixed at 5 gourdes to 1 dollar. Note.—Special rates apply to automotive equipment and agricultural machinery, imported from the United States into Argentina.

"Cédulas," and the Transandine railway bonds, aggregating together £4,100,000. Because Argentina experienced a strong capital influx from the U.S. in 1941, there followed in 1942 a requirement to register all foreign securities and to deposit dollar notes with the central bank. The free market rate on dollar exchange had been fairly stable at a level 3% above 1940. The auction or "bid" rate on foreign currencies at a substantially higher level than the free market rate was applied only to luxury goods comprising not more than 2% of imports.

Brazil announced in October the intention of supplanting the milreis by a new currency unit, the cruzeiro, to be divided into 100 centavos. This avoided the inconvenience of dividing an already small currency unit into 1,000 parts.

Colombia divides imports for exchange-control purposes into four classes with progressively less favourable rates from class I to IV. Prior to April 9 there were delays in obtaining exchange for classes II, III and IV, but after that date the decline in imports resulted in exchange being available for all classes.

Cuba, in Dec. 1941, followed by Bolivia, Ecuador, Guatemala, Haiti, Honduras, Paraguay and Venezuela early in 1942, froze the funds of axis countries.

In conjunction with a stabilization loan from the United States, Ecuador lowered its official exchange rate from 15 sucres to the dollar, at which level it had been maintained since Nov. 1940, to 14 sucres = $1.00. The change was approved on April 28 but the new rate was not effective until June 30. Rates on other countries paralleled the dollar rate.

On Feb. 6 Mexico established an office of control and supply in the ministry of national economy, charged with the issuance of certificates of necessity for products subject to export licence in the United States.

Paraguay resumed the service on its foreign debt—the London loans of 1871 and 1872, amounting to £800,000—on Aug. 26. Service had been in abeyance since 1932.

The Bank of the Republic of Uruguay on March 27 renewed the practice of charging a premium of 3½%–6% for exchange against imports of semiluxuries and domestically produced goods which the rise of the peso rate had adversely affected.

Orient.—The Chungking government was aided in its effort to stabilize monetary conditions in China by a $500,000,000 loan from the United States and £50,000,000 from the United Kingdom early in 1942. In February the Chungking government was able to abolish restriction on money movements within the country and to free the export of currency, except for newly printed banknotes sent to ports of entry or the interior, which required permission of the ministry of finance.

In territory dominated by the puppet Nanking government, the Chungking yuan was attacked and finally displaced by the Japanese authorities. In 1941 the exchange rates had been set at 1 Chungking yuan = 1 Nanking yuan = ¼ of 1 Japanese military yen. On March 23, 1942, a rate of 100 Chungking yuan = 77 Nanking yuan was proclaimed; and on May 31 a rate of 2 Chungking yuan = 1 Nanking yuan was announced and a brief interval was allowed before the use of Chungking yuan was prohibited. The Shanghai dollar had been severed from its dollar and sterling links on Jan. 1, 1942; and on Aug. 1 the Hongkong dollar was demonetized after two successive devaluations by 50%, without opportunity for holders to exchange for Japanese currency.

Throughout its field of conquest, Japan supplanted the provincial or colonial currencies with the military yen (or "gumpyo" in Japanese) at rates established by Tokyo. In the Philippines, U.S. $1 = 2 yen; in Thailand, the baht was defined in February as 1 baht = 1.551 yen, but in April the ratio was changed to 1 baht = 1 yen; in Indo-China, piastres 100 = 97.60 yen. Whereas the German "occupation marks" were envisaged by the German authorities as temporary, the Japanese were said to regard the military yen as permanent. International transactions were to be settled through clearing accounts with the Bank of Japan. The degree of over-valuation enforced by the Japanese for the yen exceeded that of the mark; the Japanese were determined to end cheap Japanese exports in the "co-prosperity sphere." (*See* also Gold.)

Exchange Stabilization Funds.

The largest operation of the U.S. Stabilization fund in 1942 was the extension of a $500,000,000 credit early in the year to the Chungking government to strengthen the Chungking yuan. The treasury granted smaller credits to support Latin American currencies throughout 1942, as for example the $5,000,000 loan to Ecuador announced on Feb. 5.

Cuba began on Feb. 11 to require the delivery of certain percentages of dollar exchange from sugar exports to the Cuban Stabilization fund against reimbursement in pesos at par. The fund had been operated with a loss because of the recent appreciation of the peso, and the decree of February was devised to provide new resources. The Cuban congress resolved in a debate on Feb. 7 to continue the fund as a valuable adjunct to a central bank which is to be established in the future.

On Dec. 29, 1941, Japan severed connections between the yen and the Anglo-Saxon currencies. Shortly thereafter it was announced that the stabilization fund of 300,000,000 yen would be wound up since there would be, it was said, no need for foreign exchange machinery in the new yen area.

In Europe, the existence of exchange controls and war conditions led to the complete inactivity of stabilization funds. (*See* also Exchange Control and Exchange Rates; Gold.) (H. S. E.)

Expenditure, Government: *see* Budgets, National.

Exploration and Discovery.

During 1942 there was practically no exploration in the Antarctic, and, while there was a lot of it in the Arctic, the whole was under the taboo of military secrecy. (V. S.)

Export-Import Bank of Washington.

The Export-Import Bank of Washington, an agency of the United States, was established on Feb. 12, 1934, for the purpose of financing and facilitating trade relations between the United States, its territories, insular possessions and foreign countries. By an act of Congress approved Sept. 26, 1940, the Export-Import bank was to continue as an agency of the United States until Jan. 22, 1947, or such earlier date as might be fixed by the president by executive order. By this act the bank was also granted specific authority to make loans which would assist in the development of the resources, in the stabilization of the economies, and in the orderly marketing of the products of the countries of the western hemisphere.

The bank in 1942 had lending authority of $700,000,000. Its capital consisted of $1,000,000 of common stock and $174,000,000 of preferred stock. All common stock, except 11 shares standing in the respective names of the trustees, was held jointly by the secretaries of state and commerce in their official capacities. All of the preferred stock was purchased by the Reconstruction Finance corporation. The bank's governing body was a board of 11 trustees representing the departments of state, treasury, commerce and agriculture, and the Reconstruction Finance corporation.

From its creation to the end of 1942, the bank had authori $1,101,761,946 of loans, compared with $837,705,261 at the cl of 1941. During 1942 disbursements amounted to $50,410, and repayments to $55,040,943. As a result, outstanding loans the end of 1942 were $181,500,341 compared with $186,130, at the end of the previous year.

Because of the international situation, the bank's commitme during 1942 were confined largely to Central and South Ameri Credits were extended in varying amounts to develop or expa the production of strategic materials; to finance highways, wat works and sewerage systems, and other public works; to facilit certain types of exports; to continue the construction of Brazilian steel mill; to develop the Itabira iron ore deposit a associated railway and port facilities in Brazil; to complete a la hydroelectric project in Uruguay; to aid in the construction o steel mill in Mexico; and to assist in carrying out other proje contributing to the development of the resources of the counti of the western hemisphere. (W. L. Pi.)

Eye, Diseases of.

Epidemic Keratoconjunctivitis (Sh yard Conjunctivitis).—In the sumr of 1941 an epidemic of an unusual type of ophthalmia star among shipyard workers at the Pearl Harbor Navy yard. By latter part of the year, the disease began to appear among sh yard workers on the west coast of the United States. During early months of 1942, it reached epidemic proportions and merous sporadic cases were seen in other parts of the count The number of cases then gradually diminished. By summe was seen but rarely.

The disease was characterized by intense swelling and redn of the conjunctiva, involvement of the lymphatic glands of face, and by the absence of discharge from the eyes. The corn became involved in a large percentage of the cases, the charact istic lesion being small superficial infiltrates. Vision was te porarily diminished in those cases having corneal involvement.
